TABLE OF CONTENTS

INTRODUCTION

This report details the results of testwork conducted on samples of Howry Creek ores and waters submitted by Art Elliott Exploration.

The test program included quantitative analysis of two ore samples and a site water sample, gravity concentration and flotation tests to recover gold from a screen fines sample, and semi-quantitative (ICP Scan) analysis of gravity concentration tailings water.

All samples were hand delivered to Lakefield Research by Mr. Art Elliott of Art Elliott Exploration, and the results and direction of the test program were discussed in telephone conversations and meetings with Mr. Elliott during the course of the project.

SUMMARY

1. Sample Description

On May 31st, 1988, samples of ore and site water from the Howry Creek mine were hand delivered to Lakefield Research by Mr. Art Elliott of Elliott Exploration. The samples were identified as follows:

Howry Creek (Pit 5)

Howry Creek Screen Fines (from ore pile)

Quartz Plug

Shaft Water

The **Screen Fines** sample consisted of approximately 15 kilograms of weathered/oxidized fines which were hand screened from the Ore Pile. The fines were medium brown in colour and of relatively low bulk density. This material was reserved for testing to recover gold values. The **Ore Pile** and **Quartz Plug** coarse rock samples were analyzed for gold by duplicate fire assay with the following results:

Pit 5	13.9 g/t (0.405 oz/ton)
	12.7 g/t (0.370 oz/ton)
Quartz Plug	1.55 g/t (0.056 oz/ton)
	1.73 g/t (0.063 oz/ton)

The **Shaft Water** sample was from an on-site shaft and was submitted in a soft drink bottle. The sample contained a small quantity of floating debris as well as a significant quantity of suspended and settled solids. The sample was agitated then allowed to settle for 24 hours. An aliquot was then removed from below the surface and submitted for quantitative water analysis. A **Certificate of Analysis** can be found in the Testwork Details section of this report.

2. Gold Recovery from Screen Fines The Screen Fines sample was treated as is on a 600 mm x 1,270 mm Wilfley shaking table (1/8th size) operated with middlings recycle. The concentrate was then cleaned once on a Mozley Mineral Separator. The Mozley concentrates were submitted for Au analysis. The Mozley and table tails were combined and reground for 15 minutes at 65% solids in a laboratory ball mill and the reground tailings were then re-tabled as above. The secondary table concentrate was then cleaned on the Mozley separator to produce a concentrate and a middling for separate analysis. Results are summarized as follows:

Combined Coarse and Fine Results

	Weight		Assays		Recovery	
Product	grams	Wt %	g/t Au	(oz/T)	mg Au	Au %
Coarse Moz Conc	2.35	0.03	1,185	34.56	2.78	2.0
Fine Moz Conc	13.1	0.18	1,185	34.56	15.52	11.2
Fine Moz Midds	662.1	9.24	84	2.45	55.62	40.1
Final Tails	6,484.9	90.5	10.0	0.29	64.85	46.7
Head (calc)	**7,162.5**	**100.0**	**19.4**	**0.57**	**138.77**	**100.0**
Comb Mozley Conc	15.5	0.22	1,185	34.56	18.31	13.2
Total Grav Conc	677.6	9.46	109.1	3.18	73.92	51.3

These data show that the fines sample contained 0.57 oz/ton gold, of which about 13% was recovered into a gravity concentrate grading about 35 oz/ton. Inclusion of the Mozley middlings yielded a product grading about 3 oz/ton containing about 50% of the gold. This lower grade, higher recovery product comprised about 10 wt% of the initial feed.

The tails from the second, reground table test were then subjected to three stage rougher-only flotation to recover gold and sulphides. Results are summarized on the following page.

2. Gold Recovery from Screen Fines (continued)

Product	Weight gram	Weight %	Assays (g/t, %) Au	Fe	S	Distribution (%) Au	Fe	S
Rghr 1 Conc	92.2	8.5	44.8	31.9	19.3	39.6	23.5	38.2
Rghr 2 Conc	94.3	8.7	31.2	32.8	18.9	28.2	24.7	38.3
Rghr 3 Conc	22.8	2.1	16.8	22.2	8.68	3.7	4.0	4.3
Rghr 3 Tail	876.1	80.7	3.39	6.81	1.02	28.5	47.7	19.2
Head (calc)	**1085.4**	**100.0**	**9.61**	**11.5**	**4.29**	**100.0**	**100.0**	**100.0**
Ro 1+2 Conc	186.5	17.2	37.9	32.4	19.1	67.8	48.2	76.5
Ro 1-3 Conc	209.3	19.3	35.6	31.2	18.0	71.5	52.3	80.8

These data show that a substantial proportion of the gold remaining in the tailings following gravity concentration was recoverable by flotation. The combined rougher concentrate graded 1 oz/ton and contained about 70% of the residual gold. This incremental gold may have been fine free gold not recovered in the gravity concentration stage, or it may have been gold encapsulated in sulphides. The corresponding sulphur and iron assays indicate that the gold tracked the sulphides but, in the absence of a detailed mineralogical examination, it cannot be stated with confidence that the gold was contained in the sulphides.

The combined effect of the two processes - gravity and flotation - are summarized as follows:

Product	Weight gram	Weight Wt %	Assays g/t Au	Assays oz/T Au	Distributions mg Au	Distributions Rec %
Coarse Moz Conc	2.35	0.03	1,185	34.6	2.78	2.0
Fine Moz Conc	13.1	0.18	1,185	34.6	15.48	11.2
Fine Moz Midds	662.1	9.24	84.0	2.45	55.61	40.1
Rghr Conc	1,250.5	17.46	37.1	1.08	46.38	33.4
Rghr Tail	5,234.4	73.08	3.53	0.103	18.47	13.3
Head (calc)	7,162.4	100.0	19.37	0.565	138.73	100.0
Combined Conc	**1,928.0**	**26.9**	**62.4**	**1.82**	**120.3**	**86.7**

These data show that 87% of the gold was recovered into 27% of the weight at a grade of 1.8 oz/ton.

2. Gold Recovery from Screen Fines (continued)

In the first gravity test, the sample was tabled as is then reground and re-tabled. Results were improved with regrinding, so a second fresh sample of screen fines was reground first, then subjected to gravity concentration with upgrading on the Mozley separator. Cobalt was analyzed in addition to gold in this test to determine if cobalt could be concentrated by gravity. Results were as follows:

	Weight		Assays			Recoveries (%)	
Product	grams	Wt %	g/t Au	(oz/T)	% Co	Au	Co
Mozley Conc	14.48	0.15	601	17.5	0.230	21.6	1.9
Mozley Tail	1,191.0	12.6	6.00	0.17	0.024	17.7	16.6
Table Tail	8,254.5	87.3	2.97	0.09	0.017	60.7	81.5
Head (calc)	**9,460.0**	**100.0**	**4.27**	**0.12**	**0.018**	**100.0**	**100.0**
Table Conc	1,205.5	12.7	13.1	0.38	0.026	39.3	18.5

The feed sample for this test was significantly lower in grade (0.12 oz/ton) than the previous sample of screen fines (0.55 oz/ton). The Mozley concentrate was lower in grade but higher in recovery than in the previous test. This degree of variation would be acceptable in the treatment of small quantities of ore of similar grade. The effect of the lower grade is difficult to predict. In the treatment of tonnage quantities, however, it would be reasonable to expect that recovery could be held at about 20 % while achieving grades of +30 oz/ton.

The above test confirms the presence of cobalt in the ore at a grade of 0.018% or about 5 oz/ton. The cobalt was upgraded by a factor of 12 to about 67 oz/ton in the gravity concentrate, but recovery was very low at about 2%.

3. Analysis of Table Tails Water

Following the first table test, a quantity of water was decanted from the collected tailings. The water sample was allowed to settle and was then filtered through a Millipore filter and submitted for analysis by Semi-quantitative Inductively Coupled Argon Plasma Spectroscopy. The most significant constituents are summarized below and a complete Certificate of Analysis can be found in the Testwork Details section of this report.

Element	mg/L
As	0.44
Ca	33.0
Mg	4.36
Na	3.28
Ni	0.15
S	8.18
Si	1.49
SO4	23.4
pH	7.4

The higher values for sulphur, sulphate sulphur, arsenic and nickel can probably be attributed to the fact that the screen fines were recovered from an ore pile which had been lying exposed to the elements for a number of years. It should be noted that the degree of dilution resulting from a laboratory scale gravity concentration test may not be comparable to the dilution which would occur in a production plant.

CONCLUSIONS

The gold contents of the two individual ore samples submitted, as determined by duplicate fire assay were as follows:

Howry Creek (Pit 5)	0.388 oz/ton
Quartz Plug	0.060 oz/ton

The gold contents of the two Screen Fines samples, as calculated from fire assays of test products were as follows:

Screen Fines 1	0.566 oz/ton
Screen Fines 2	0.125 oz/ton

Gravity concentration tests were conducted on the high and low grade Screen Fines samples using a Wilfley shaking table and a Mozley Mineral Separator. Tests on the high grade material showed that, with a moderate regrind prior to processing, about 13% of the gold was recovered into a product grading about 35 oz/ton. Only about 2% of the gold was recovered without regrinding. An additional 40% of the gold was recovered into a middling product grading about 2.5 oz/ton. In a similar test on the low grade material, about 22% of the gold was recovered into a product grading about 18 oz/ton. Cobalt analyses in this test showed that less than 2% of the cobalt is recovered into the gravity concentrate. A flotation test showed that about 70% of the gold could be recovered into a concentrate grading about 1 oz/ton, this product comprising about 20% of feed weight.

TESTWORK DETAILS

Art Elliott Exploration **Gravity Concentration Report** LR-3532
(Howry Creek)

Test 1 - Table/Mozley on Unground Fines

Art Elliott Exploration (Howry Creek) **Flotation Test Report** LR-3532

Test No. : T-3

Feed : Test 2 Table Tails

Purpose : To investigate the flotation recovery of gold from a sample of Howry Creek Ore.

Procedure: A 1,085.4 gram sample of Test 2 Table Tails was roughed three times in a Denver D-1 500 gram laboratory flotation cell operated at 1,500 RPM according to the conditions set out below.

Operating Conditions:

	Reagents (g/tonne)			Time (min)		
Stage	A350	CuSO4	MIBC	Cond	Float	pH
Rougher 1	50		11	5	5	8.2
Rougher 2	30			3	3	6.9
Rougher 3	30	250		5	3	6.2
Totals	110	250	11	13	11	

Metallurgical Results:

	Weight		Assays (g/t, %)			Distribution (%)		
Product	gram	%	Au	Fe	S	Au	Fe	S
Rghr 1 Conc	92.2	8.5	44.8	31.9	19.3	39.6	23.5	38.2
Rghr 2 Conc	94.3	8.7	31.2	32.8	18.9	28.2	24.7	38.3
Rghr 3 Conc	22.8	2.1	16.8	22.2	8.68	3.7	4.0	4.3
Rghr 3 Tail	876.1	80.7	3.39	6.81	1.02	28.5	47.7	19.2
Head (calc)	1085.4	100.0	9.61	11.5	4.29	100.0	100.0	100.0
Ro 1+2 Conc	186.5	17.2	37.9	32.4	19.1	67.8	48.2	76.5
Ro 1-3 Conc	209.3	19.3	35.6	31.2	18.0	71.5	52.3	80.8

Comments:

Results show that about 70 % of the gold was recovered into a flotation concentrate grading about 1 ounce per ton Au (35.6 g/t). Iron and sulphur assays indicate that the gold tracked the sulphides.

Test 4 - Table/Mozley on Fresh Sample

A 10 kilogram charge of Howry Creek screen fines, hand delivered by Art Elliott, was ground at 50 % solids for 15 minutes in the large ball mill. The ground sample was then tabled with middlings recycle to produce approximately one kilogram of concentrate. The concentrate was then cleaned on a Mozley Mineral Separator.

Product	grams	Assays g/t Au	Assays (oz/T)	Assays % Co	Recoveries (%) Au	Recoveries (%) Co
Mozley Conc	14.48	601	17.53	0.230	21.6	1.9
Mozley Tail	1,191.0	6.00	0.17	0.024	17.7	16.6
Table Tail	8,254.5	2.97	0.09	0.017	60.7	81.5
