SUMMARY

This report represents the final summary of the **Phase I drilling program** on the **Sargesson Lake** property, located in the Sudbury Mining Division of north-central Ontario, Canada. The property is located about 86 road km northeast of the City of Sudbury (Figure 1). The current exploration program is a joint venture between Pacific North West Capital Corp. (CDNX:PFN) and Consolidated Venturex Holdings Ltd. (CDNX:CVA), both of Vancouver, Canada.

The Sargesson Lake property has the potential to host economic accumulations of platinum (Pt), palladium (Pd) and gold (Au) metals in association with disseminated to bleb copper (Cu) - nickel (Ni) sulphides (chalcopyrite, pyrrhotite and pentlandite). The **Phase I drilling program**, completed between October 19th and October 23rd, 1999, totalled 320 m (1050 ft) in 6 holes and was designed to test the down-dip and strike potential of known surface sulphide mineralization.

Summary of diamond drill hole parameters, Sargesson Lake property.

INTRODUCTION

The **Sargesson Lake property**, centred at Latitude 46°40'24"N Longitude 80°19'58"W or 551025mE-5169075mN (NTS 41/NE), consists of one (1) unpatented mining claim bloc (15 claim units) covering 240 ha in Janes Township, Sudbury Mining Division, Ontario. The property is located about 86 road km northeast of the City of Sudbury (Figure 1). The current exploration program is a joint venture between Pacific North West Capital Corp. (CDNX:PFN) and Consolidated Venturex Holdings Ltd. (CDNX:CVA), both of Vancouver, Canada.

A total of 6 diamond drill holes (NQ core = 4.76 cm diameter) totalling 320m (1050 ft) were completed during the Phase I drilling program from October 19th-23rd, 1999. Table 1 lists details from the 6 drill holes and Figures 2 and 3 show the locations of the drill holes relative to the mining claims and in detail on the exploration grid. Drill core logs are provided in Appendix I, drill hole cross sections are in Appendix II, sample assays are in Appendix III and graphical presentation of the data is in Appendix IV.

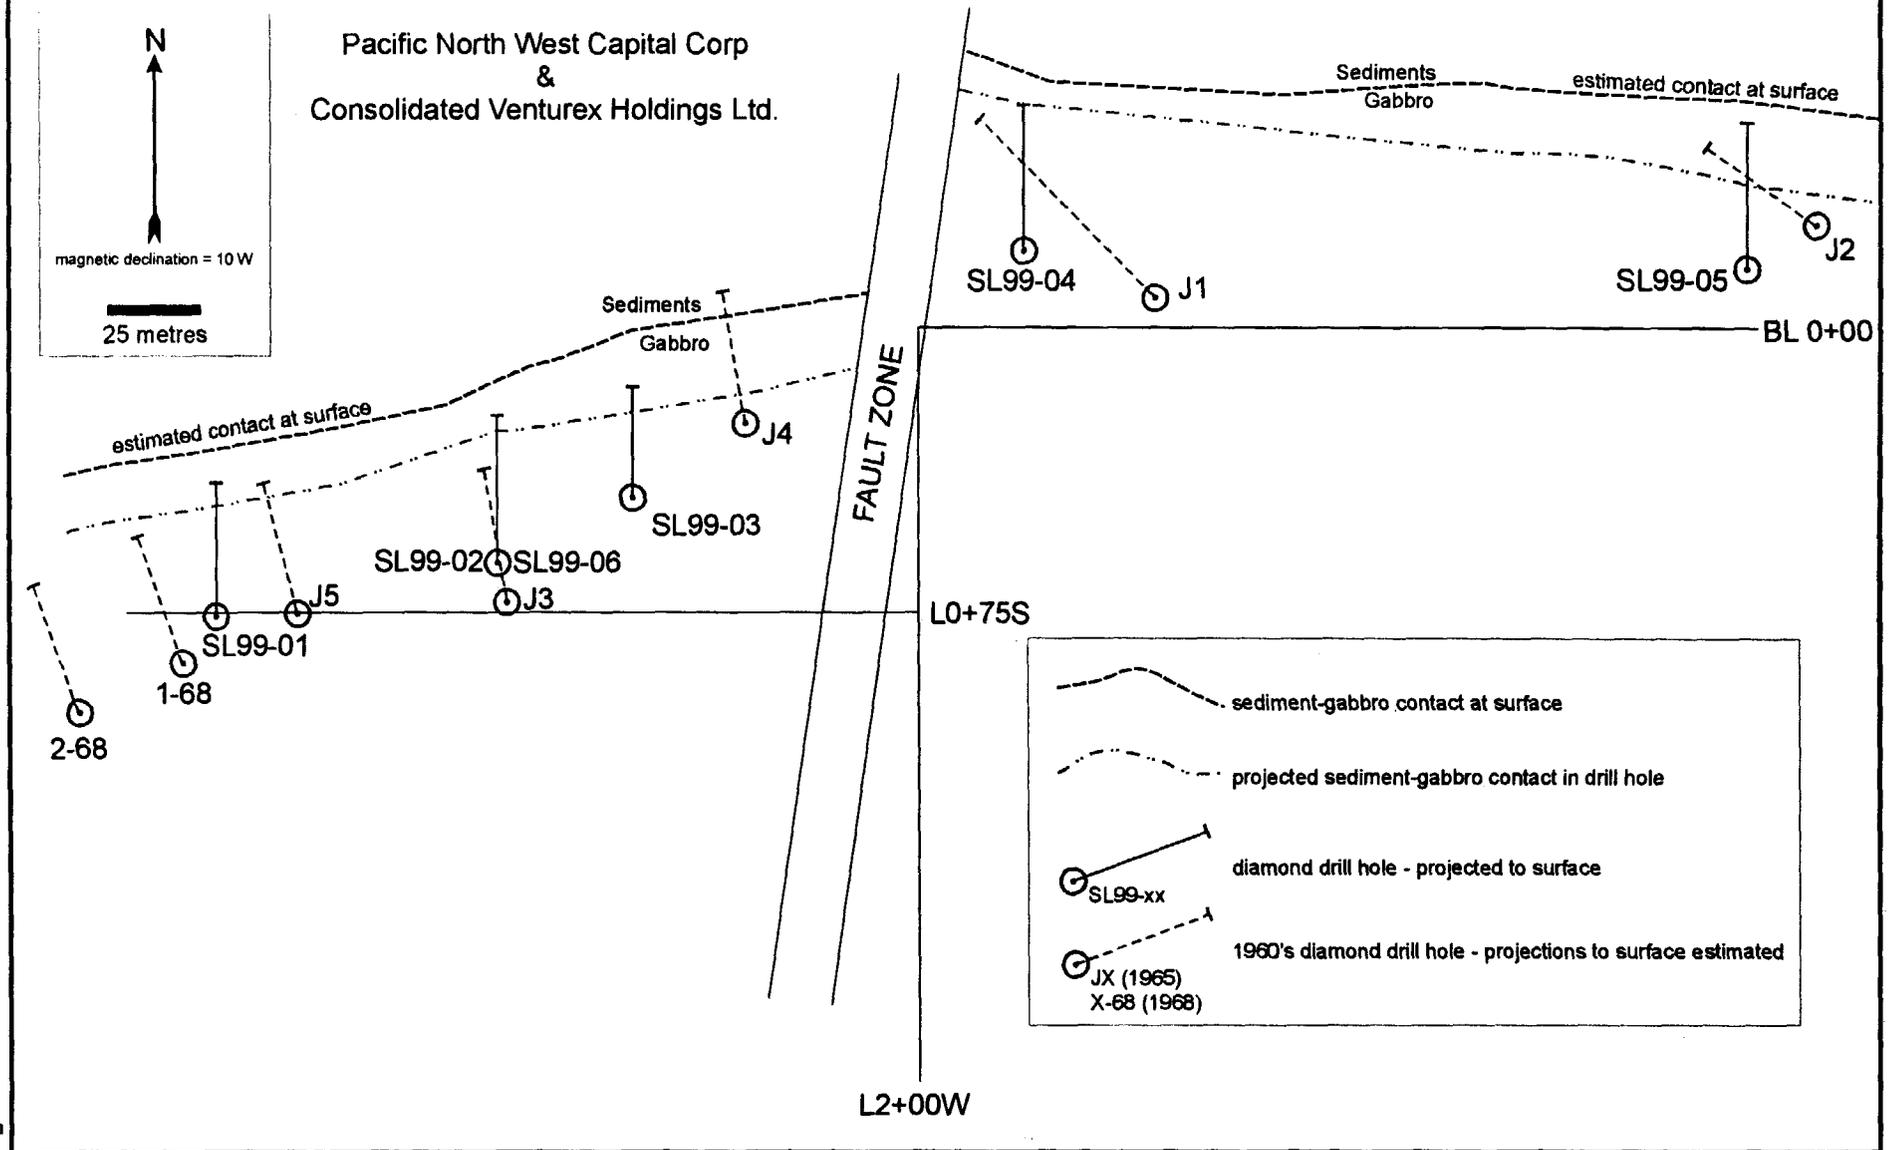

Figure 4. Main components of the current exploration grid with location of 6 drill holes from current drilling program and location of 7 drill holes ca. 1965-1968, Sargesson Lake property, Janes Township, Ontario.

LOCATION & ACCESS

The **Sargesson Lake property**, centred at Latitude 46°40'24"N Longitude 80°19'58"W or 551025mE-5169075mN (NTS 41/NE), lies within Janes Township and is about 86 road km northeast of the City of Sudbury, Sudbury Mining Division, Ontario (Figure 1). The property can be reached by travelling about 45 km east from Sudbury to Hagar along Highway 17. At Hagar, turn north (left) following secondary road 535 for about 22 km until reaching an abandoned railway bed. After crossing the railway bed, follow the right fork in the road for about 10 km until the road crosses the railway bed. Immediately after the crossing, turn north-northwest (left), following the road northward for about 7 km to the north end of the claim bloc; the last 2 km of this road is negotiable only by 4-wheel drive truck or ATV.

CLAIM STATUS

The Sargesson Lake property consists of one (1) unpatented mining claim bloc (15 claim units) covering 240 ha (Figure 2 and Table 2).

Table 2. Distribution of Mining Claims on the Sargesson Lake property.

Claim	Township	Units	Hectares
S-1230271	Janes	15	240
TOTALS:		15	240

Claim S-1230271 is on option by PFN from F. Racicot.

REGIONAL GEOLOGY

The **Huronian-Nipissing Magmatic Province (HNMP)** consists of intrusive bodies such as the East Bull Lake, Agnew Lake and River Valley Intrusions (ca. 2.4 Ga) and younger intrusions (ca. 2.2 Ga) of Nipissing Diabase (Gabbro) that intruded into Paleoproterozoic sedimentary rocks of the Huronian Supergroup (ca. 2.45 Ga). Northwest-trending olivine gabbro dykes (ca. 1.2 Ga) of the Sudbury Swarm crosscut all of the older rock types. To date there are no known economic Cu-Ni-PGM sulphide deposits associated with Nipissing Gabbro (PGM = Pt+Pd+Au). Nonetheless, numerous showings (>50 known) with anomalous PGM values (1-10 g/t PGM) are recorded throughout the HNMP.

Nipissing Diabase (gabbro) comprises >25% of the outcrop area in the HNMP and consists of dominantly tholeiitic to calc-alkaline rocks. The majority of Nipissing gabbros occur as near-horizontal sheets or undulating sills, consisting of basins and arches, and dykes that are generally less than 1000 m thick. In this form, disseminated to massive sulphide mineralization is concentrated within the basin or limb portions with pods of dominantly massive pyrrhotite occurring within the arches. **Lopolithic forms** outcrop as irregular-shaped intrusions and may represent deeper feeder systems to the stratigraphically higher sill and cone-shaped intrusions. In this form disseminated to semi-massive sulphides are hosted by hypersthene gabbro within tens of metres of the footwall sedimentary rocks and within irregular regions at the footwall contact. This form is characterised by the gabbroic intrusion at PFN's Janes property. **Arcuate** and open ring outcroppings of Nipissing Gabbro and structural features of surrounding sedimentary rocks suggest inward-dipping, **cone-shaped intrusions** in which disseminated sulphides hosted by hypersthene gabbro are within a few hundred metres of the basal contact. This form is typified by the gabbroic intrusion at PFN's Kelly property and CVA's Sargesson Lake property. **The gabbroic body on the Sargesson Lake property is either a dyke or sill and although it is now structurally separated from the Janes property, it may have originally formed part of the same intrusive body.**

PROPERTY GEOLOGY

A steeply southeast dipping gabbroic body of the Nipissing Diabase suite underlies the most prospective area of the **Sargesson Lake property**. Stratigraphic sequences of the gabbroic rocks suggest that the northern contact represents the basal contact of the intrusion. The property is primarily underlain by rocks of the Nipissing Diabase suite, which in this area include hypersthene (mafic) gabbro, gabbro, leucogabbro, vari-textured gabbro, and pegmatitic gabbro. Also outcropping on this property are magnetite-bearing olivine diabase dyke(s) of the Sudbury Swarm.

The gabbro is bound to the north, south and east by rocks of the Lorrain Formation (quartz arenite/arkose) and to the west by rocks of the Gowganda Formation; the western contact is represented by the Floodwood Chutes Fault. In terms of the Huronian Supergroup stratigraphy, the Lorrain Formation stratigraphically overlies the Gowganda Formation, and it would appear that the Floodwood Chutes Fault represents a normal fault along which the gabbroic body to the west (Janes property) was uplifted relative to the Sargesson Lake gabbro. This faulting does not preclude the likelihood that the Sargesson Lake gabbroic body is a dyke-like extension emanating from the larger gabbroic body that outcrops further to the west on PFN's Janes property.

The Sargesson Lake property is within about 5 km of the Grenville Front Tectonic Zone (GFTZ), located to the southeast. The GFTZ represents a complex zone that is several kilometres wide and consists of generally southeast-dipping imbricate thrust faults. **Metamorphic grade** in the area of the Sargesson Lake property ranges from lower greenschist (chlorite zone) to upper greenschist facies (biotite-chlorite zone) which is characterised by the presence of metamorphic biotite in the gabbroic rocks. It is important to note that the Sargesson Lake property is relatively close to the GFTZ and as such was subjected to a higher grade of metamorphism when compared to the Davis-Kelly or Janes properties.

Bedrock exposure on the Sargesson Lake property is limited to about 30% with the remaining areas covered mostly by a thin (< 1 m) veneer of humus, poorly developed soils and glacial till, and low areas of cedar and spruce swamp.

Mineralization

Sulphide mineralization consists of varying proportions of chalcopyrite, pyrrhotite and pentlandite that occur primarily as disseminated grains but with subordinate bleb

sulphide. Total sulphide content ranges from <1% to about 15% where it is hosted by medium-grained hypersthene-bearing gabbro (1-5% orthopyroxene) and quartz-gabbro; sulphides are mainly confined to within 10-30 m of the lower gabbro-sedimentary contact. Subordinate sulphides also occur in vari-textured to coarse-grained gabbroic patches within hypersthene-bearing gabbro. The textures, host gabbroic rock types and local geological setting are similar to those observed at PFN's Janes property from which highly anomalous PGE values are reported.

PROJECT RATIONALE & PREVIOUS WORK

The Sargesson Lake property has the potential to host economic accumulations of PGM metals in association with disseminated to bleb Cu-Ni sulphides (chalcopyrite, pyrrhotite, pentlandite). The diamond drilling program was designed to test the down-dip extension and strike continuity of several surface showings exposed in trenches. The exposed mineralization occurs within 10's of metres of the northern contact over an intermittent strike length of about 500 m. The location and attitude of the drill holes (Table 1 and Figure 3) was based on the results of grab samples collected during the 1999 surface exploration program and on the base metal results reported from previous diamond drilling (Table 3).

The earliest recorded work on the Sargesson Lake property was in 1964 when several chalcopyrite and pyrrhotite occurrences were discovered by a prospector. Several trenches and pits exposed the mineralization for several hundred metres and in a northeast strike direction. In 1965 and 1968, Pan Central Explorations Limited conducted a magnetometer survey followed by a diamond drilling program that included 8 holes, totalling 527 m in length (Table 3). Drilling intercepted a mineralized zone that is described as being several hundred metres in length and parallel to a gabbro-sediment contact; the zone is apparently confined to within 30 m of this contact. In 1965, Pan Central Explorations Limited reported drill intercept values that ranged from 0.08-0.80% Cu (averaged 0.36% Cu) and 0.07-0.74% Ni (averaged 0.19% Ni). No assay values were reported from the 1968 drilling program and no assays for platinum or palladium were reported from either 1965 or 1968. The exact location of these drill holes is not known but their estimated location on the current grid is shown in Figure 4.

TABLE 3. Drill core assays from Pan Central Explorations Ltd. (1965/68), Sargesson Lake property.

DDH No.	Hole Length (feet)	From (feet)	To (feet)	Length (feet)	Au (oz/t)	Cu (%)	Ni (%)

		144.0	149.0	5.0	—	0.80	0.23
J-5	160.00	43.2	47.0	3.8	—	0.45	0.27

“—” = not reported

In 1997, F. Racicot collected 17 grab samples from rubble around old trenches and pits. Eleven of the 17 samples reportedly returned assay values of 38-175 ppb Pt, 44-250 ppb Pd and 80-289 ppb Au. The highest reported value was 705 ppb Pt+Pd+Au and Pd:Pt ratios averaged 1.4:1.

The 1999 surface exploration program included establishing an exploration grid, grid prospecting and sampling and regional prospecting and sampling. Grab samples collected during grid prospecting (north grid) assayed up to 2.1 g/t PGM, 0.76% Cu and 0.32% Ni. Prospecting on the south grid led to the discovery of a new zone of sulphide mineralization, located about 500m southwest of the north grid mineralization, that assayed up to 2.8 g/t PGM, 0.07% Cu and 0.04% Ni.

CURRENT RESULTS

All 6 drill holes were logged and sampled at various levels of detail. Drill core logs are provided in Appendix I, drill hole cross sections are provided in Appendix II, sample assay sheets are provided in Appendix III and plots of assay data are provided in Appendix IV. A total of 238 drill core samples were submitted for Pt, Pd, Au, Cu, Ni analysis (Table 4).

Table 4. Summary of core samples taken from 6 drill holes, Sargesson Lake property.

Drill Hole	No. Samples Batch 1	No. Samples Batch 2
SL99-01	11	27
SL99-02	22	22
SL99-03	6	19
SL99-04	0	43
SL99-05	26	6
SL99-06	40	16
TOTALS:	105	133

Sampling & Analytical Techniques

The drill core (NQ core = 4.76 cm diameter) was sampled in Sudbury where a diamond saw was used to split the core and half of the core was then sent for analysis at XRAL Laboratories in Don Mills, Ontario. Sampling was prioritized such that sections with the highest sulphide content were shipped out soon after the drill program was completed (Batch 1); the remaining drill core was sampled and sent out soon after (Batch 2).

Core samples were prepared and assayed for platinum, palladium, gold, copper and nickel by XRAL Laboratories (member of the SGS international inspecting & testing organisation) located in Don Mills, Ontario. Platinum, palladium and gold assays were completed at their lab in Rouyn-Noranda, Quebec and copper-nickel at their main lab in Don Mills, Ontario. Platinum, palladium and gold assays were done using fire assay fusion (lead collection) with a DCP finish. Lower detection limits are 10ppb Pt, 1ppb Pd, and 1ppb gold. Assays for copper and nickel were completed at XRAL's main lab in Don Mills, Ontario using an aqua regia digest followed by Inductively Coupled Plasma (ICP) finish. Lower detection limits are 10ppm Cu and 10ppm Ni. After temporary storage at

XRAL Laboratories, pulps and rejects are returned to the Sudbury field office and stored at the company warehouse.

Independent Assay Checks

A total of 7 rock pulps from samples that returned values ≥ 0.9 g/t (ppm) Pt+Pd+Au were sent to Accurassay Laboratories in Thunder Bay, Ontario for independent assay check. Accurassay Laboratories uses fire assay fusion (lead collection) followed by Atomic Absorption analysis. The results of the re-checks and comparison to the original values are provided in Table 5.

Table 5. Assay re-checks and original assay values, Sargesson Lake property.

Sample	ORIGINAL – XRAL				CHECKS – ACCURASSAY				Percentage from Original PGM
	Pt (ppb)	Pd (ppb)	Au (ppb)	PGM (ppb)	Pt (ppb)	Pd (ppb)	Au (ppb)	PGM (ppb)	
43773	173	243	1393	1809	269	356	456	1081	67.3
43822	204	418	360	982	221	292	326	839	17.0
43913	216	382	386	984	273	343	385	1001	1.7
43968	239	346	400	985	243	317	373	933	5.6
43969	208	324	410	942	176	217	1001	1394	32.4
43970	245	363	370	978	216	376	302	894	9.4
43972	242	365	429	1036	268	346	357	971	6.7

Re-check values range from within 1.7-67.3% of the original assay values. The two highest differences (32.4% and 67.3%) are the result of extreme differences in gold concentration; Pt and Pd values are within 33-35% for these two samples. The two highest variances aside, the difference in Pt+Pd+Au range from 1.7-17% which is an acceptable level of reproducibility.

Background Values

Using a weighted average from a total of 143 barren (<1% total visible sulphide) gabbroic rock samples, background values for the Sargesson Lake property are estimated at 15 ppb Pt, 21 ppb Pd, 17 ppb Au (53 ppb PGM), 285 ppm Cu and 194 ppm Ni and background ratios are about 1.2:1 for Pd:Pt and 1.4:1 for Cu:Ni. Although the background PGM values are typical for a *normal* mafic rock (i.e. 30 ppb Pt, 21 ppb

Pd, 5 ppb Au), they are very anomalous in terms of Cu and Ni when compared to a normal mafic rock (i.e. 94 ppm Cu, 145 ppm Ni).

Drill Hole Results

All 6 drill holes had intersections that assayed anomalous PGM (5-25 x background) Cu (1-21 x background) and Ni (1-14 x background) values. A summary of the most significant PGM-Cu-Ni results is provided in Table 6.

Table 6. Summary of assay results, Sargesson Lake property.

	56.00	58.47	2.47	0.27	0.02	0.06	0.08

*PGM = Pt+Pd+Au

Geology and Mineralization

Initial *visual* results from the Sargesson Lake drilling program were very encouraging with 5 of the 6 holes having intervals with total sulphide contents $\geq 1\%$. In general there is good agreement between the initial visible sulphide percentages noted and the actual PGM-Cu-Ni assay values (Table 7). On the basis of holes SL99-02 and SL99-06, the footwall sediment-gabbro contact is dipping at about 60° southeast. Sulphide

mineralization generally occurs between 10 m and 30 m above the footwall and appears to be contained within 2 zones. The 2 zones are separated by as much as 10 m and were not intersected in all of the holes. Maximum true width of either of the mineralized zones is about 9 m and based on holes SL99-02 and SL99-06 the lowermost zone may be thickening at depth.

For the most part, the sulphides occur as bleb and disseminated chalcopyrite, pyrrhotite and pentlandite. The highest PGM contents are associated with both mafic (hypersthene-bearing) gabbro that is dark in colour and has a mafic:felsic mineral ratio greater than 60:40 and gabbro (mafic:felsic mineral ratio ~50:50). The association with hypersthene-bearing gabbro is typical of PGM-mineralized Nipissing Diabase.

Table 7. Summary of geology and sulphide mineralization, Sargesson Lake property

Platinum-Group & Base Metal Data

The average assay values from the 238 samples are 39 ppb Pt, 74 ppb Pd, 61 ppb Au (175 ppb PGM), 884 ppm Cu, 439 ppm Ni, 1.7:1 Pd:Pt and 1.7:1 Cu:Ni. Average assay values from each of the 6 drill holes are listed in Table 8. Averages include assays from all rock types encountered and sampled in the drill holes – i.e. gabbroic, sedimentary and dyke rocks. The highest 10 assays recorded from the drilling program are from holes SL99-01, 02, 04, 05 and 06 and are listed in Table 9 along with a brief description of their respective rock types.

Table 8. Average Pt-Pd-Au-Cu-Ni assay values, Sargesson Lake property.

VS=visible sulphide; hyp = hypersthene, typical in mafic gabbro; *ratios refer to mafic:felsic minerals

Graphical Presentation of PGM-Cu-Ni Data

Several graphs of the PGM-Cu-Ni data including geochemical sections through each of the drill holes are provided in Appendix IV. There is moderate agreement between the visible sulphide (a somewhat subjective variable) noted in the drill core and the PGM values obtained from assay ($R^2 = 0.53$).

CONCLUSIONS

As a preliminary examination, this diamond drilling program was successful in testing the down-dip and strike extension of known surface mineralization on the north grid. Moreover, the program provided the first PGM values for a property that what was already known to have anomalous base metal values from previous drilling. There are several important observations that can be made on the basis of this drilling program:

- (1) PGM-enriched surface sulphide mineralization (northern contact on north grid) is traceable at depth (~55 m down-dip in SL99-06) and has a minimum potential strike length of 500m.
- (2) The footwall sediment-gabbro contact dips at about 60° to the southeast and may shallow slightly with depth.
- (3) Sulphide mineralization occurs 10-30 m above the footwall contact and appears to be contained within 2 zones that are separated by as much as 10 m (not intersected in all 6 holes).
- (4) The maximum intersection of mineralization in the upper zone is **7.50 m of 0.58 g/t PGM, 0.33% Cu and 0.14% Ni** and the maximum intersection in the lower zone is **1.20m of 1.34 g/t PGM, 0.19% Cu and 0.13% Ni**.
- (5) The highest PGM-Cu-Ni values and widths of anomalous mineralization were from holes SL99-01 and 06; westernmost drill-tested area. Drill hole SL99-06, the deepest hole, intersected **8.0 m of 0.88 g/t PGM, 0.61% Cu and 0.26% Ni**.
- (6) The easternmost drill hole (SL99-05) intersected **1.20 m of 1.34 g/t PGM**, the highest PGM value of the program.
- (7) Sulphides occur as bleb and disseminated chalcopyrite, pyrrhotite and pentlandite. Highest PGM concentrations are primarily associated with mafic (hypersthene-bearing) gabbro that is dark in colour and has a mafic:felsic mineral ratio greater than 60:40.
- (8) Mineralization associated with the northern contact (north grid) is open to the northeast and the southwest. About 500 m to the southwest is a second area of mineralization (south grid) that appears to be in the same geological environment as the north grid mineralization where it follows the southwest extension of the northern contact. Samples from this area assayed up to **2.8 g/t PGM**.

Assay values and observations derived from this diamond drilling program indicate that the Sargesson Lake PGM-Cu-Ni property is deserved of further exploration.

RECOMMENDATIONS

On the basis of the Phase I diamond drilling program, it is recommended that the following programs, totalling \$93,500, be implemented:

(1) Induced Polarization-Ground Magnetometer Survey: (\$25,000)

Geophysical surveys should be designed to test the extent of disseminated sulphides and possibility for semi-massive to massive sulphides on the north grid and to correlate any responses with diamond drilling results. In addition, an orientation survey should be conducted on the south grid in the area of the new mineralized zone. These surveys will assist in developing further drill targets.

(2) Phase II diamond drilling in north grid area: (\$40,000)

A 500 m drill program should be aimed at further testing the northeast-southwest strike and down-dip extension of the known mineralized zones. In particular, the area between drill holes SL99-04 and 05 should be examined, as should the down-dip potential of mineralization under drill holes SL99-01 and 06. Drill hole centres should be placed at a maximum separation of 50 m and intersections with the footwall contact should be made whenever feasible. Any significant sub-surface IP-Mag anomalies should be drill-tested.

(3) Diamond Drilling in area of south grid showing: (\$16,000)

Encouraging PGM assay results (2.8 g/t PGM) from a limited prospecting program on the south grid, about 500 m southwest of the north grid showings, suggests a second zone of mineralization; perhaps a southwestern extension from the north grid. A drilling program, consisting of approximately 200 m, should be aimed at testing the sub-surface extent of mineralization in this area. The design of the drill program should follow any recommendations made after the follow-up prospecting and orientation induced polarisation surveys are completed.

In addition to these drilling program, it is recommended that further prospecting and sampling be completed on the north and south grids (~\$5,000). Depending on the initial prospecting, a minimal (~\$7,500) trenching/stripping and sampling program might also be considered in the area of the new "south grid showing". Specifics of the drilling programs should be based on the results of the prospecting and geophysical programs.

CERTIFICATE OF QUALIFICATION

I, Scott Jobin-Bevans of 225 Ferndale Avenue, Sudbury, Ontario, Canada, do hereby certify that:

1. I am a consulting geologist with the mineral exploration company JB Exploration & Development Inc. of Sudbury, Ontario.
2. I am a graduate of the University of Manitoba, Winnipeg, Manitoba with a B.Sc. (Hons.) Geology - 1995, and M.Sc. Geology - 1997.
3. I am a member of the Society of Economic Geologists and the Canadian Institute of Mining, Metallurgy and Petroleum.
4. I have been an exploration geologist and prospector for ten years.
5. I am a member of the Association of Geoscientists of Ontario.
6. I have an active prospector's license for the province of Ontario (# H14027).
7. I have not received any direct or indirect interest in Pacific North West Capital Corporation.
8. This report is intended to be an overview of the potential of the property or properties with recommendations and conclusions that are based solely on the available data.

Scott Jobin-Bevans (B.Sc., M.Sc. Geology)
December 1999

APPENDIX I

Diamond Drill Core Logs

Abbreviations used in the core logs:

occ = occasional

FF = fracture fill

a/w = associated with

ds = disseminated sulphide

bs = bleb sulphide

ss = stringer sulphide

cpy = chalcopyrite

po = pyrrhotite

pn = pentlandite

py = pyrite

vfg = very fine-grained

fg = fine-grained

mg = medium-grained

cg = coarse-grained

peg = pegmatitic

Kspar = Potassium feldspar

CA = core axis

fspar - feldspar

RQD = indicates % of core recovery

ALTN = alteration

JNT = joint

hyp = hypersthene

UM = ultramafic

SZ = shear zone

carb = carbonate

qtz = quartz

SKETCH MAP - SARGESSON LAKE PROPERTY, DDH LOCATIONS

Pacific North West Capital Corp
&
Consolidated Venturex Holdings Ltd.

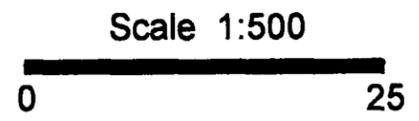

LEGEND

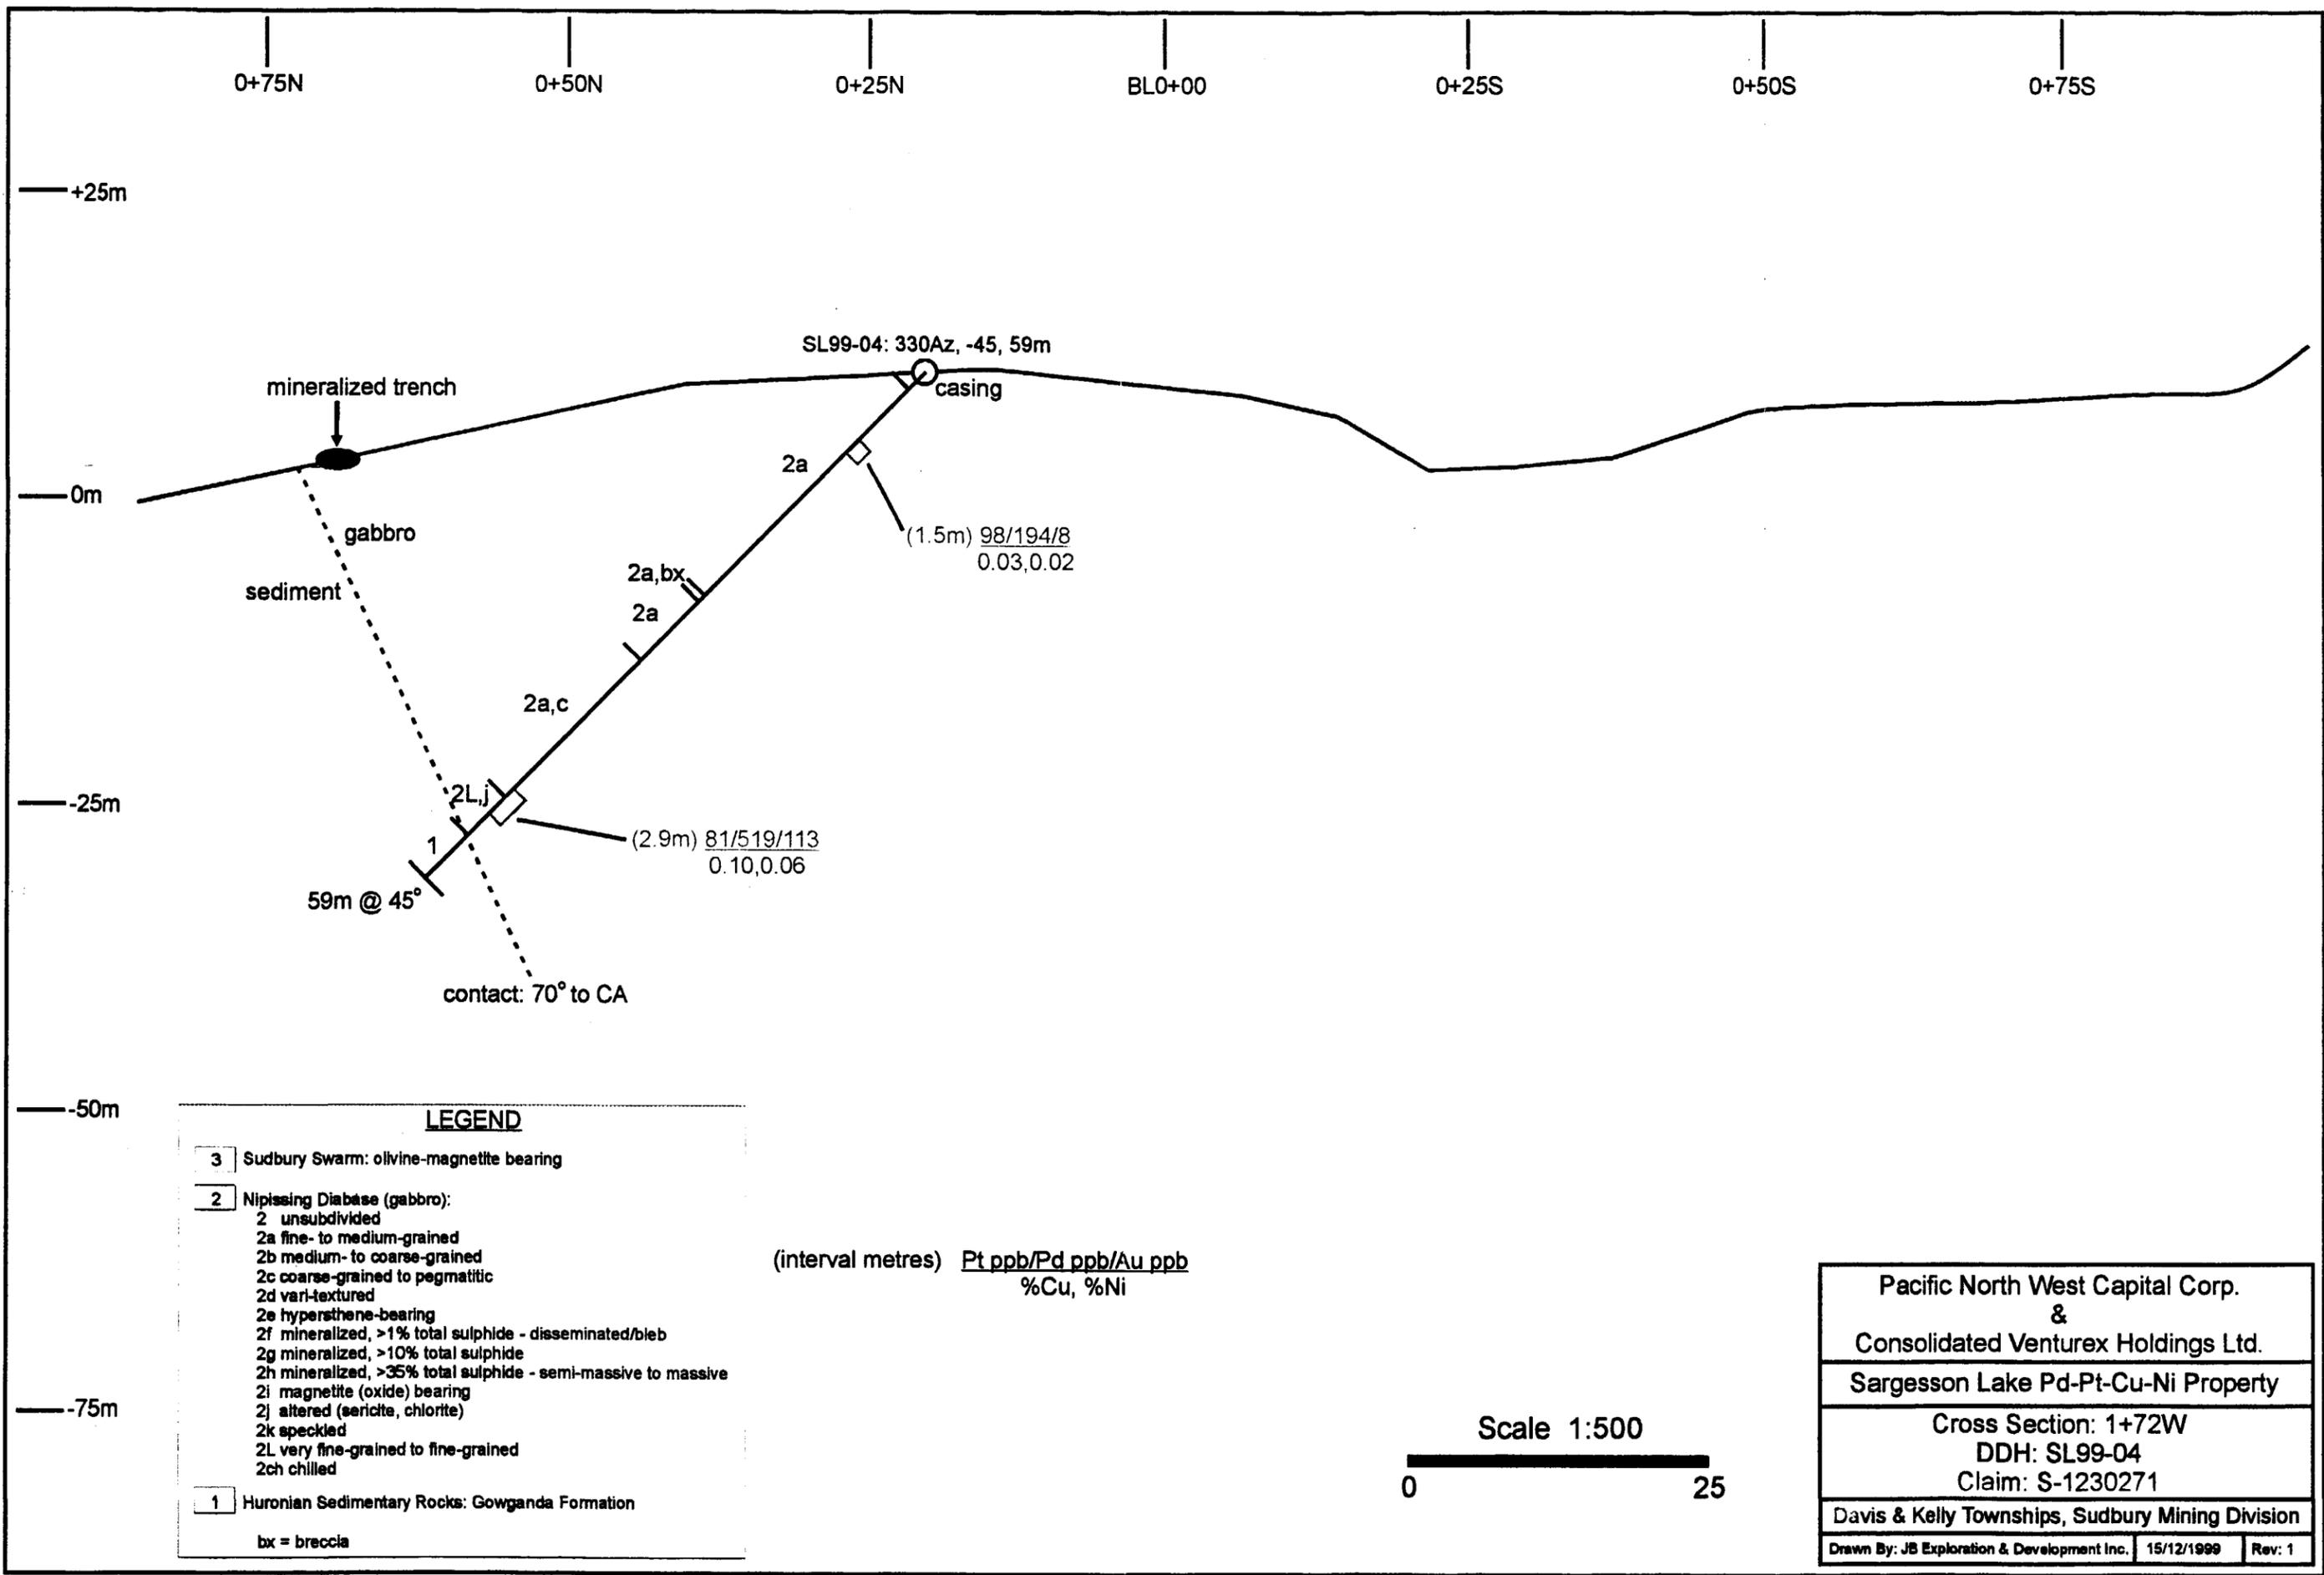

- 3 Sudbury Swarm: olivine-magnetite bearing
- 2 Nipissing Diabase (gabbro):
 - 2 unsubdivided
 - 2a fine- to medium-grained
 - 2b medium- to coarse-grained
 - 2c coarse-grained to pegmatitic
 - 2d vari-textured
 - 2e hypersthene-bearing
 - 2f mineralized, >1% total sulphide - disseminated/bleb
 - 2g mineralized, >10% total sulphide
 - 2h mineralized, >35% total sulphide - semi-massive to massive
 - 2i magnetite (oxide) bearing
 - 2j altered (sericite, chlorite)
 - 2k speckled
 - 2L very fine-grained to fine-grained
 - 2ch chilled
- 1 Huronian Sedimentary Rocks: Gowganda Formation

bx = breccia

(interval metres) Pt ppb/Pd ppb/Au ppb

RECEIVED MAY 29 2000 A.M. 5:10:22 P.M. 7 8 9 10 11 12 1 2 3 4 5 6

1. Recorded holder(s) (Attach a list if necessary) STATUS OF THE LANDS SHOWN HEREON.

Name: FRANK CHARLES RALCOT, Address: 1912 SPRINGDALE CRES. SUDBURY, ON. P3A 5J1, Client Number: 185390, Telephone Number: 705-525-5920, Fax Number: (same)

2. Type of work performed: Check (✓) and report on only ONE of the following groups for this declaration.

- Geotechnical: prospecting, surveys, assays and work under section 18 (regs)
Physical: drilling stripping, trenching and associated assays
Rehabilitation

Work Type: Diamond drilling with assays, Office Use, Commodity, Total \$ Value of Work Claimed: 31,250, Dates Work Performed: 19/10/1999 to 23/10/1999, Township/Area: JANES TWP, M or G-Plan Number: G-2907, Mining Division: Sudbury, Resident Geologist District: Sudbury

- Please remember to: - obtain a work permit from the Ministry of Natural Resources as required; - provide proper notice to surface rights holders before starting work; - complete and attach a Statement of Costs, form 0212; - provide a map showing contiguous mining lands that are linked for assessing work; - include two copies of your technical report.

RECEIVED MAY 29 2000 GEOSCIENCE ASSESSMENT OFFICE

3. Person or companies who prepared the technical report (Attach a list if necessary)

Name: Laurence Scott Jobin-Bevans, Address: 225 Ferndale Ave. Sudbury ON. P3B 3C2, Telephone Number: 705-524-8060, Fax Number: 705-521-0653

4. Certification by Recorded Holder or Agent

I, L. Scott Jobin-Bevans, do hereby certify that I have personal knowledge of the facts set forth in this Declaration of Assessment Work having caused the work to be performed or witnessed the same during or after its completion and, to the best of my knowledge, the annexed report is true.

Signature of Recorded Holder or Agent: [Signature], Date: MAY 25/00, Agent's Address: 225 Ferndale Ave, Sudbury, Telephone Number: 705-524-8060, Fax Number: 705-524-0653

Work to be recorded and distributed. Work can only be assigned to claims that are contiguous (adjoining) to the mining where work was performed, at the time work was performed. A map showing the contiguous link must accompany this m.

I, Laurence Scott Jobin-Bevans (Print Full Name), do hereby certify that the above work credits are eligible under subsection 7 (1) of the Assessment Work Regulation 6/96 for assignment to contiguous claims or for application to the claim where the work was done.

Signature of Recorder, Holder or Agent Authorized in Writing: [Signature] Date: MAY 25/00

6. Instruction for cutting back credits that are not approved.

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- 3. Credits are to be cut back equally over all claims listed in this declaration; or
- 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

2, 20356

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.

 GEOSCIENCE ASSESSMENT
 OFFICE

Personal information collected on this form is obtained under the authority of subsection 6 (1) of the Assessment Work Regulation 6/96. Under section 8 of the Mining Act, this information is a public record. This information will be used to review the assessment work and correspond with the mining land holder. Questions about this collection should be directed to a Provincial Mining Recorder, Ministry of Northern Development and Mines, 3rd Floor, 933 Ramsey Lake Road, Sudbury, Ontario, P3E 6B5.

Work Type	Units of work Depending on the type of work, list the number of hours/day worked, metres of drilling, kilometres of grid line, number of samples, etc.	Cost Per Unit of work	Total Cost
Geological Consulting	18.3 days	\$300. ⁰⁰	\$5,490. ⁰⁰
Geological Consulting	14.0 days	\$250. ⁰⁰	\$3,500. ⁰⁰

Food and Lodging Costs			
	Accommodation - 7 days	(weekly) 1	\$390. ⁸⁴
	Trailer Rental - 7 days	\$100	\$700. ⁰⁰
Total Value of Assessment Work			\$31,250.⁰⁰

Calculations of Filing Discounts:

2.20656

1. Work filed within two years of performance is claimed at 100% of the above Total Value of Assessment Work.
2. If work is filed after two years and up to five years after performance, it can only be claimed at 50% of the Total Value of Assessment Work. If this situation applies to your claims, use the calculation below:

TOTAL VALUE OF ASSESSMENT WORK x 0.50 = Total \$ value of worked claimed.

Note:

- Work older than 5 years is not eligible for credit.
- A recorded holder may be required to verify expenditures claimed in this statement of costs within 45 days of a request for verification and/or correction/clarification. If verification and/or correction/clarification is not made, the Minister may reject all or part of the assessment work submitted.

Certification verifying costs:

I, Laurence Scott Jobin-Bevans, do hereby certify, that the amounts shown are as accurate as may reasonably be determined and the costs were incurred while conducting assessment work on the lands indicated on the accompanying

Declaration of Work form as AGENT I am authorized to make this certification.
(recorded holder, agent, or state company position with signing authority)

Dear Sir or Madam:

Submission Number: 2.20356

Status

Subject: Transaction Number(s): W0070.00108 Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. **WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.**

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice. Allowable changes to your credit distribution can be made by contacting the Geoscience Assessment Office within this 45 Day period, otherwise assessment credit will be cut back and distributed as outlined in Section #6 of the Declaration of Assessment work form.

Please note any revisions must be submitted in **DUPLICATE** to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact JIM MCAULEY by e-mail at james.mcauley@ndm.gov.on.ca or by telephone at (705) 670-5880.

Yours sincerely,
