RE: WORK REPORT

1) Building Stone - Hutton township (Map 6)

The Espanola limestone beds in Lot 4, Concession IV, Hutton township are not well exposed and our objective was to strip and expose portions of the bed to determine continuity and to test the limestone for building stone potential. The program demonstrated that the limestone beds are continuous, are widely

page 2

spaced (2-3 m). Cutting and polishing highlighted an attractive gray-white marble with black to green wavy lines and white to pink calcitic inclusions.

Two samples from the deposit were assayed for gold but gave only a trace response. In addition, sample No. 182198 was submitted for a multi-element analysis. (Accurassay Laboratories, Certificate of Analysis 45900). This analysis gave values of:

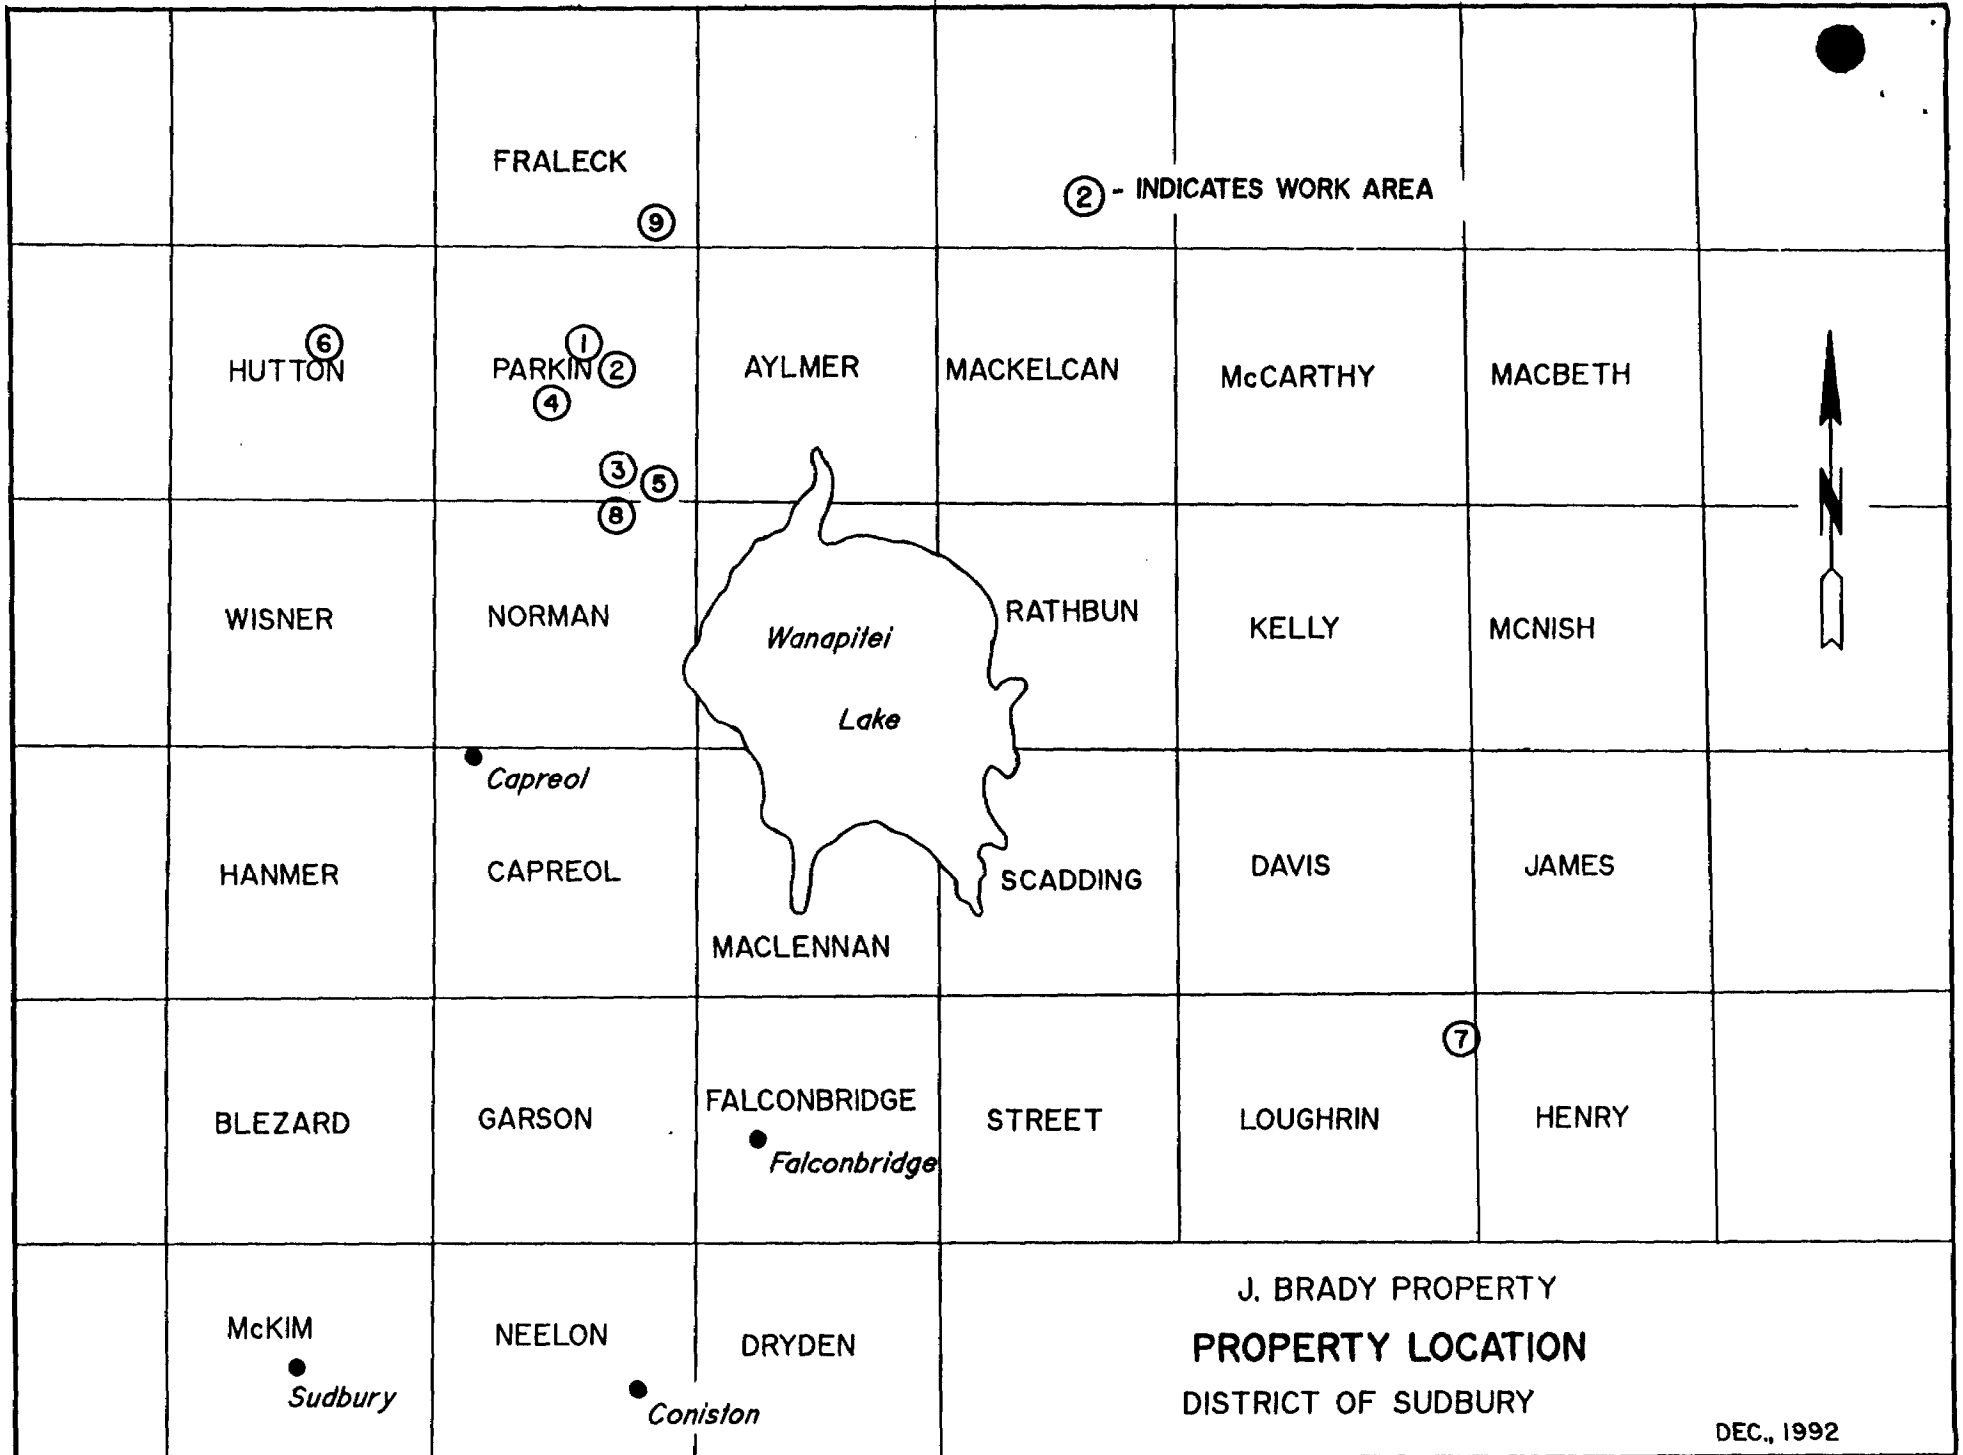

Ca	18.02%
Mg	11.29%
Si	0.73%
Al	0.54%

Meyn (1970) reports that "For the manufacture of Portland cement the limestone should contain less than 2.5% magnesia. Silica should not exceed 13% and alumina should not exceed 3.7%". Sample 182198 gives calculated values of:

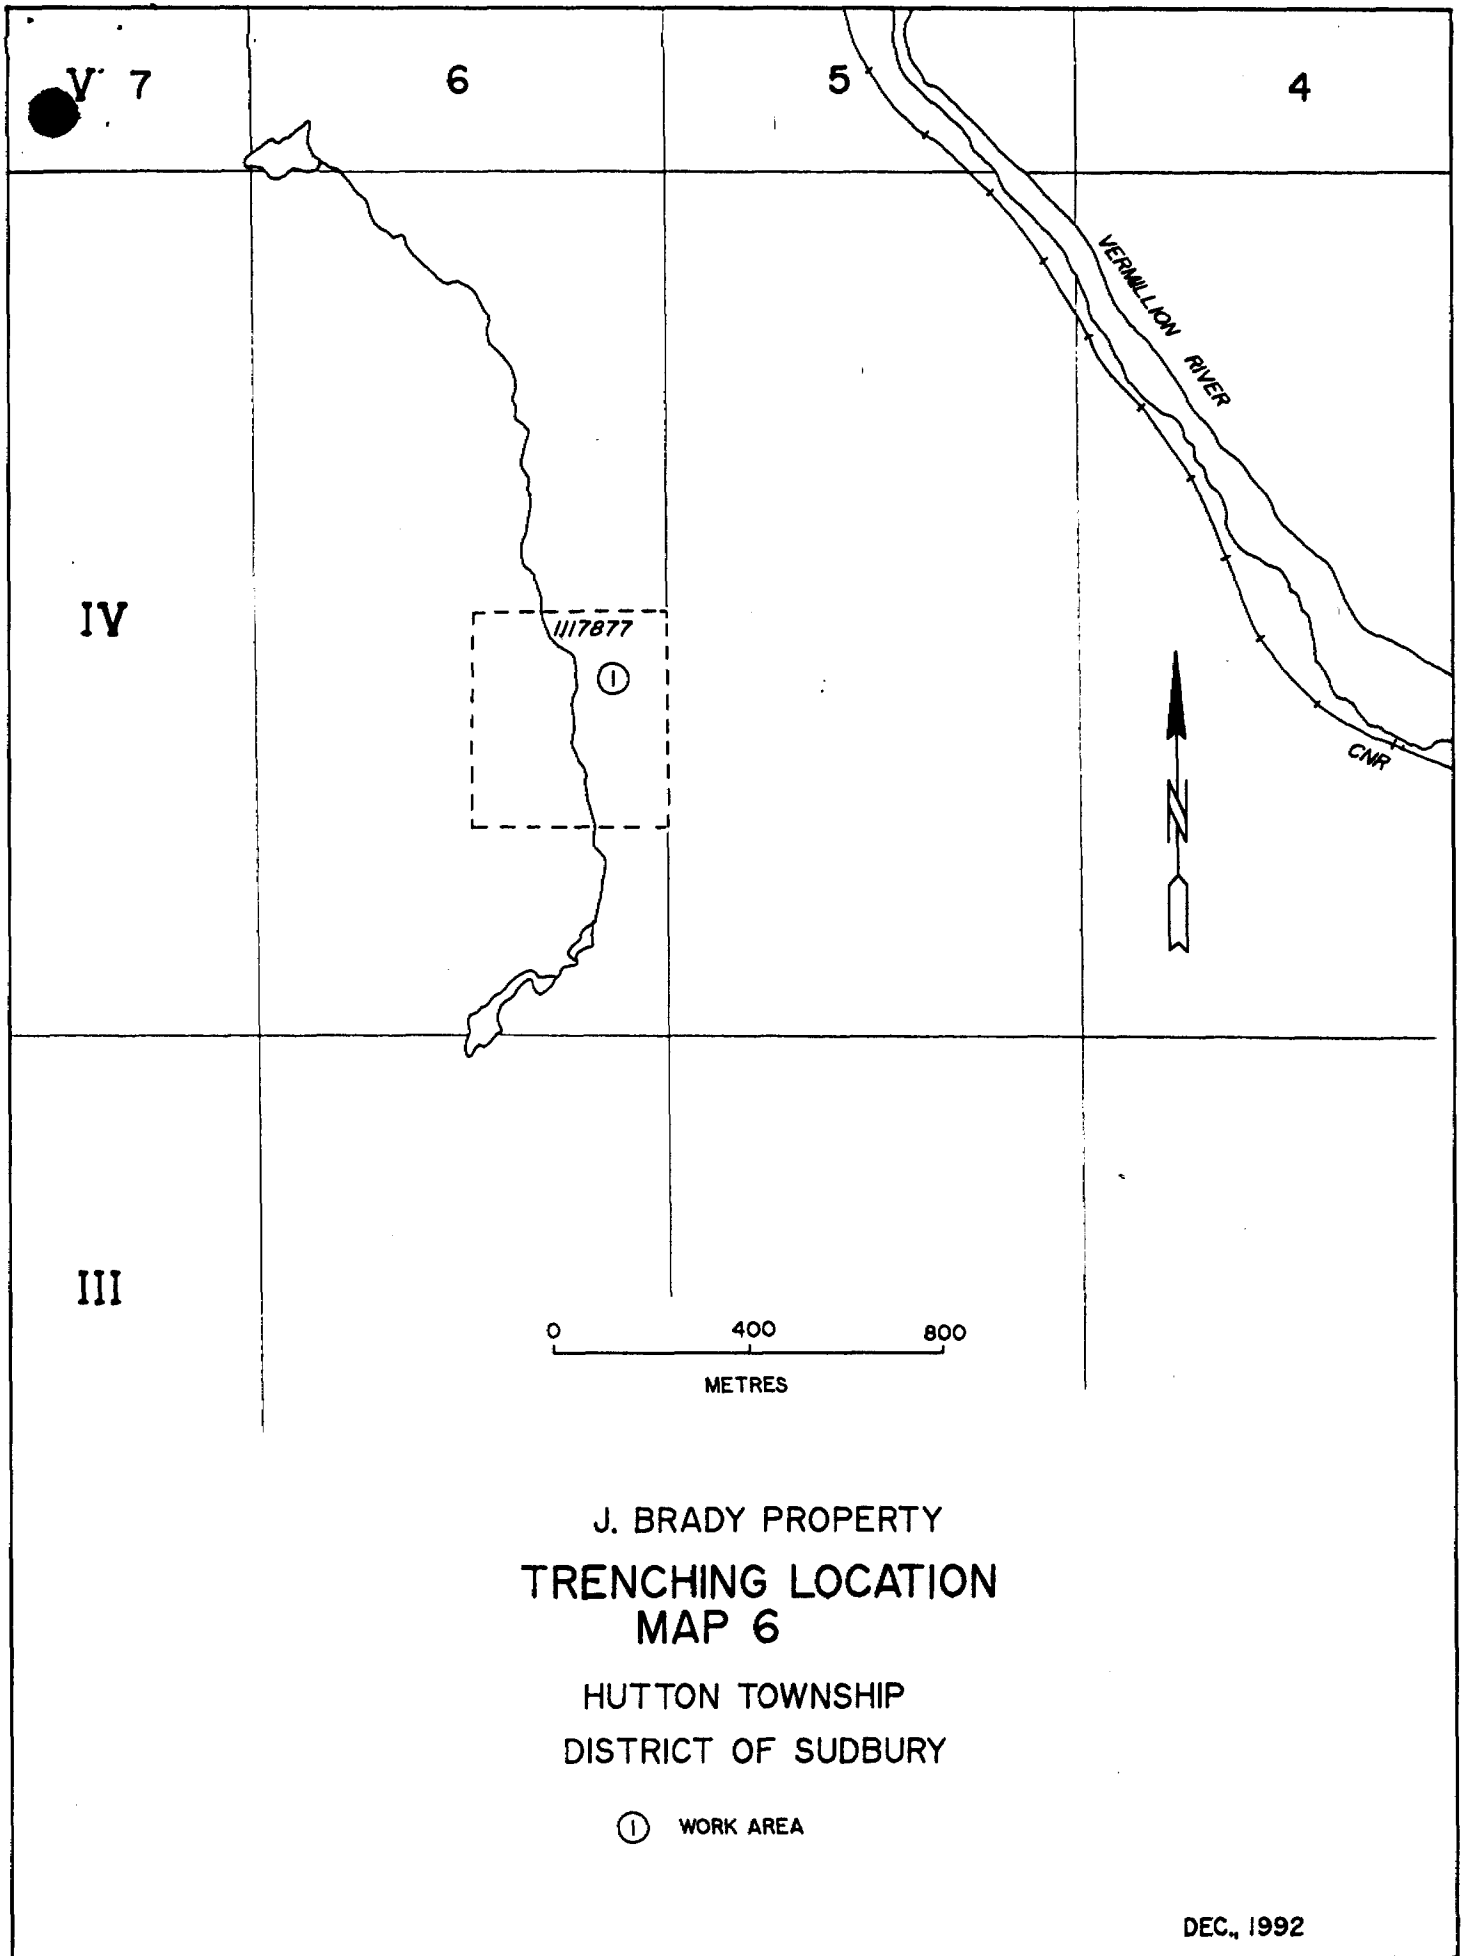

CaCO ₃	45.05%
MgCO ₃	39.14%
SiO ₂	1.56%
Al ₂ O ₃	1.02%

On the basis of the magnesia content of one sample the material is not suitable for Portland cement however, the silica and alumina contents are acceptable. Additional work may indicate areas of acceptable magnesia content, i.e., less than 2.5%. This work is of a very preliminary nature however, it indicates that additional exploration and sampling may indicate material acceptable for agricultural and/or industrial applications. The work to date has indicated a significant tonnage of limestone is available if material of appropriate

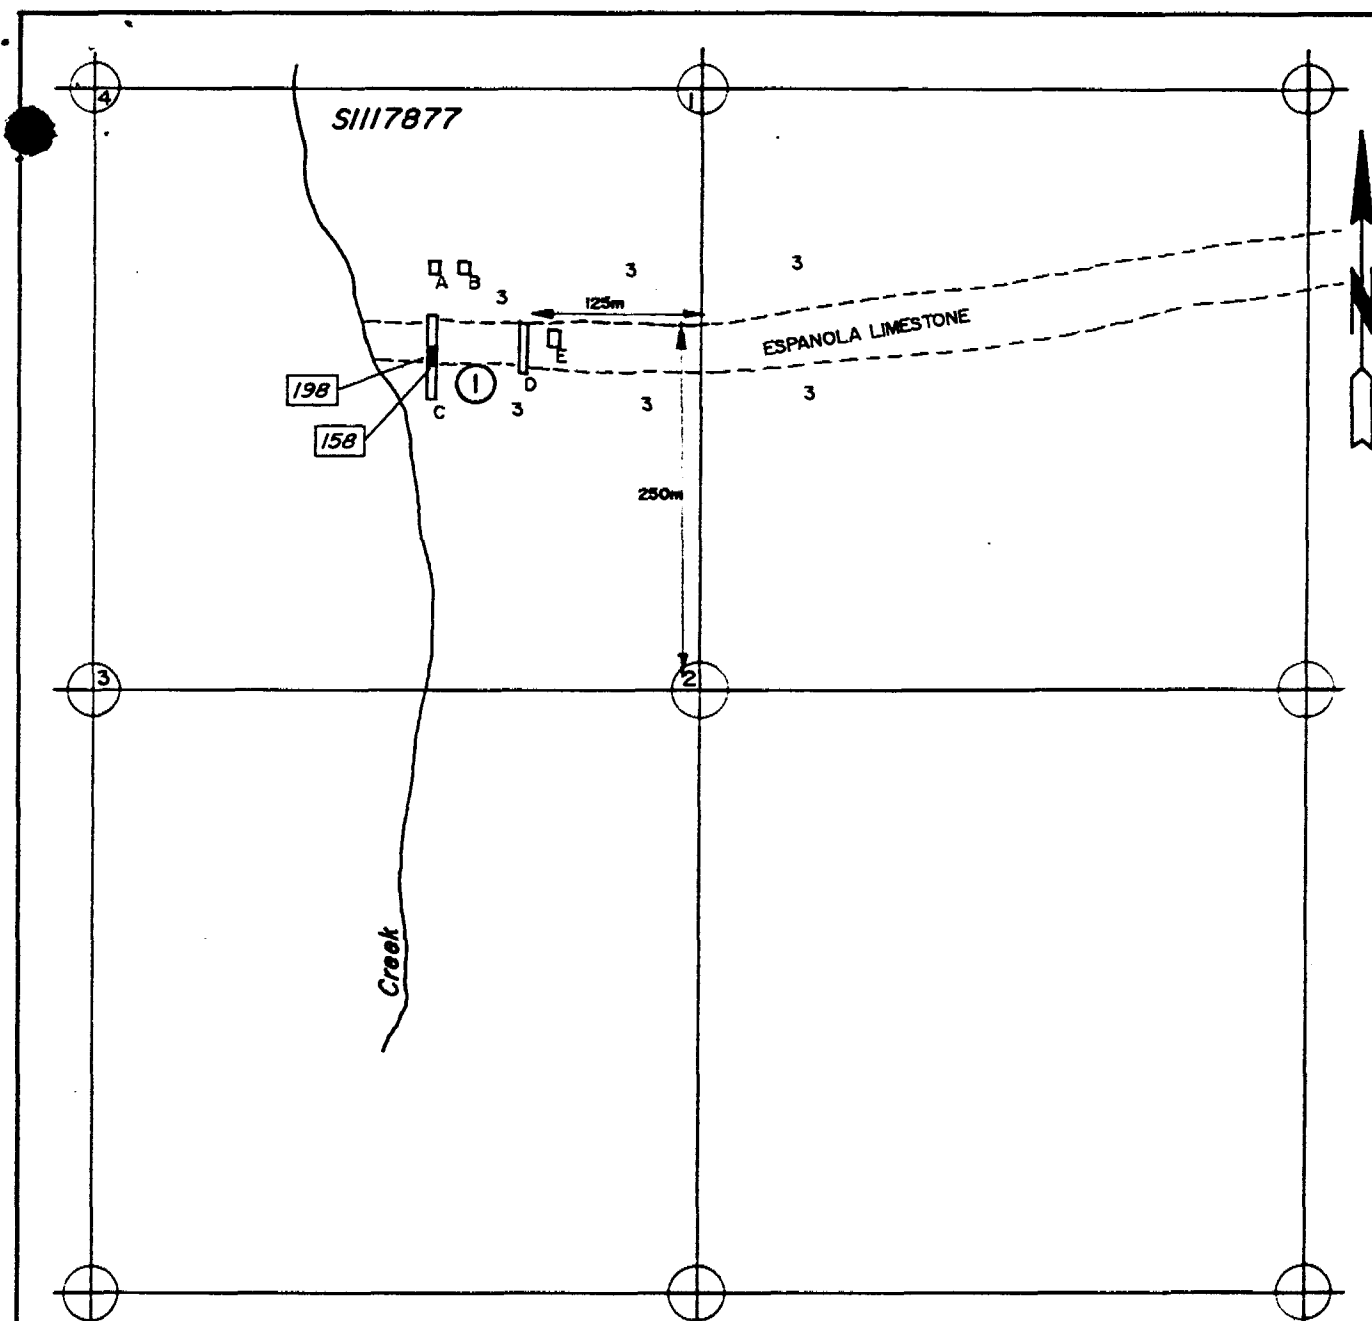

grade can be obtained.
