## INTRODUCTION

The 30 claims forming the Vermilion River Property (Appendix A and Figure 1) were optioned from the original staker, Oliver Maki, in June of 1987. The claims were optional in order to assess the placer gold potential, as this area has been known to contain gold bearing gravels, sands and clays.

## WORK PERFORMED

This portion of the work program consisted of overburden drilling, using a portable vibracore drill manufactured and supplied by Sonic Soil Sampling Inc. Tables 1 and 2, and Figure 2, give the location of drilled and attempted holes.

This drilling program is subsequent to geological mapping conducted September 29, 1987. Topographic features observed indicated the possible presence of buried Pleistocene channel deposits. The current drilling program was to test for these deposits.

## DRILLING TECHNOLOGY AND PROCEDURE

The vibracore drill is driven by high frequency vibration created by a cam in the drill head, and penetrates overburden under its own weight. Because of its drive mechanism, the drill is most capable of penetration in water saturated soils, where the high frequency vibrations cause fluidization of the soil substrate being penetrated. The bit consists of a short open tube that is flared at its operating end. Due to the non-friction operating nature of the vibracore drill, it is incapable of penetration where particle size surpasses the open-diameter of the bit. BQ drill rod was used, thus the drill could not easily penetrate tills and other bouldery sediments.

The areas to be drilled were generally covered by a thin layer of till. For this reason, drill locations were scouted and shallow pits were dug by hand to determine surface till thickness in order to ascertain soil drillability. Drilling generally continued through fine grained sediments down to and slightly into pebble and cobble horizons. Overburden drill core was logged and bagged in four foot lengths for sampling. Samples were weighed and panned to form a heavy particles concentrate for assay.

## WORK CREDITS

The majority of work credits for this phase of the program are being applied for drilling expenditures. Two (2) credits are being applied for under manual work (subsection 77(18) of the Mining Act) where shallow pre-drilling pits did not result in drilling locations. A total of 6.4 work credits are being applied for as "drilled core" for hole E3 under subsection 77(5)(a) of the Mining Act. Applicable receipts for expenditures form Appendix B. Credits applied for are summarized in Table 3.

## RESULTS AND DISCUSSION

It is known through previous and present work that much of the terrain where Pleistocene channel deposits occur is overlain by a thin veneer of glacial till. This presented several difficulties in drilling with the vibracore system. Drilling was performed with success, however, over some of the area. Figure 2 illustrates the channel sequence discovered during the September mapping session and during the current drilling program. The channel sequences have been conservatively drawn, and may laterally cover considerably more area, especially to the north where drilling attempts through till cover (holes A2, A3 and B3) were unsuccessful. Figure 3 schematically shows the channel sequences discovered, illustrating the stratigraphic complexity of the system.

Although the current exploratory drilling program was a technical success, assays did not prove grades to be high enough to warrant development of channel sequences west of Vermilion River. A second drilling program is anticipated to begin early in the 1987-88 winter season along other portions of the claim group.

DECLARATION

I, Richard P. Gagne, residing in Peterborough, Ontario, do hereby declare that I have continuously practiced the profession of Geology for the past 5 years and that I hold a degree of Bachelor of Science with Honours received in 1983 from Carleton University in Ottawa, Ontario.

I do hereby declare that this report is based upon personal work in the field and on the supervision thereof and in the plotting and study of results.

A handwritten signature in black ink, appearing to read 'R. P. Gagne', is written over a horizontal line. The signature is stylized and somewhat cursive.

Richard P. Gagne, B.Sc.Hon.Geol.  
Geologist

Total Miles of line Cut <b>N/A</b>	

Credits Requested per Each Claim in Columns at right

Mining Claims Traversed (List in numerical sequence)

Special Provisions	Geophysical	Days per Claim
For first survey: Enter 40 days. (This includes line cutting)	- Electromagnetic	
	- Magnetometer	
	- Radiometric	
	- Other	
For each additional survey: using the same grid: Enter 20 days (for each)	Geological	
	Geochemical	
Man Days	Geophysical	Days per Claim
Complete reverse side and enter total(s) here	- Electromagnetic	
	- Magnetometer	
	- Radiometric	
	- Other	
	Geological	
	Geochemical	
Airborne Credits	Electromagnetic	Days per Claim
Note: Special provisions credits do not apply to Airborne Surveys.	Magnetometer	
	Radiometric
