PREAMBLE

Subsequent to my General Report of November 8th, 1963, which was used to qualify an underwriting of McKinney Gold Mines Ltd. shares, a geophysical survey by Magnetometer and Electromagnetic methods was completed on the greater part of eleven (11) eastern claims. (See Table above for claim numbers). Final maps and reports were received late January, 1964.

Based on the findings of this Geophysical Report and other data contained in my November 8th, 1963 Report, a preliminary Diamond Drilling Program, for a minimum 2500 footage to be expended in six (6) holes, was recommended in my Report of February 27th, 1964.

A contract covering this drilling and dated May 6th, 1964, was signed with Continental Diamond Drilling Company Limited of Rouyn, Quebec on or about May 11th, 1964.

A drill camp was located on Claim SSM-66421 at the shore of the north-west bay of Mamainse (Smith) Lake. Service to this camp was via the Carp River Road (Mileage 43 on Highway 17 North from Sault Ste. Marie) for a distance of some 8 miles by Jeep and Truck to the north end of Mamainse Mountain. At this point a bridge was built by Continental to cross the Carp River and a drill-tractor trail was cut for 1½ miles to the drill camp.

Flying service can also be used from Sault Ste. Marie, a distance of 38 miles to Mamainse Lake.

The first hole was started on May 24th, 1964.

On or before this date, McKinney Gold Mines Ltd., (Ontario Mining Licence A-37025) transferred title to all of the mining claims

mentioned herein to JOGRAN MINES LTD. (Ontario Mining Licence A-37315)

The diamond drilling program was suspended August 21st, 1964.

DEVELOPMENT BY DIAMOND DRILLING - Preliminary Contract.

Five (5) of the preliminary diamond drill holes, namely, Nos. 1, 3, 4, 5 and 6, were completed by June 26th for a total footage of 2335 feet.

The site location for No. 2 Hole proved unsatisfactory for a suitable drill "set-up" and has not, to the date of this report, been drilled.

These preliminary holes were sited to test individual and/or multiple electromagnetometer cross-overs (anomalous zones). Nos. 1 and 3 Holes collared 250 feet apart, and on Line 200 East, were drilled to test two anomalous cross-overs. Nos. 4, 5 and 6 Holes were drilled to test similar cross-overs on Lines 1000 West, 1200 West and 1400 West, respectively. Each of these three cross-overs were individual anomalous zones and, as such, had no connection one with the other, nor with Nos. 1 and 3 Holes.

The sulphide mineralization intersected in Diamond Drill Holes 4, 5 and 6 returned indications of copper thus:-

NO. 4 HOLE - Line 1000 West - 1800 feet north.

210.5 to 211.5	- 1 Foot @ 1.02% Copper.
214 to 225	- 11 Feet @ 0.10% Copper.

NO. 5 HOLE - Line 1200 West - 1300 feet north.

235 to 235.5	- 0.5 Feet - 6" fault seam @ 30 to 35 Degrees C/A
235.5 to 238.5	- 3.0 Feet @ 0.12% Copper.
305 to 310	- 5 Feet @ 0.11% Copper.
310 to 315	- 5 Feet @ 0.10% Copper.
315 to 320	- 5 Feet @ 0.11% Copper.

NO. 6 HOLE - Line 1330 West - 650 feet north.

172.7 to 173.9	- 1.2 Feet @ 0.21% Copper.
181.6 to 188.2	- 6.6 Feet @ 0.14% Copper.
280.9 to 292.2	- 11.3 Feet @ 0.06% Copper.

Extensive sulphide mineralization was intersected in Holes Nos. 1 and 3.

HOLE NO. 1 - Line 200 East - 1250 feet north.

\- Drilled S 27 W at 45 Degrees.

Indications of chalcopyrite in seams and fractures were evident throughout the total length of 560 feet. However, none of this mineralization returned economic copper content.

Twenty-nine (29) samples were taken for a total length of 192 feet of core. (Length of Hole - 560 feet)

The sections and average assays were:-

130 to 216 - 86 Feet @ 0.15% Copper.
High Assay - 0.36% over 2 feet.
Low Assay - 0.11% over 11 feet.

250.5 to 258.5 - 8 Feet @ 0.03% Copper.

277 to 354 - 77 Feet @ 0.09% Copper, in Quartz Felsite Porphyry.
High Assay - 0.14% over 5 feet.
Low Assay - 0.05% over 5 feet.

354 to 375 - 21 Feet @ 0.10% Copper.

HOLE NO. 3 - Line 200 East - 1500 feet north.

- This hole was drilled at 45° on the same line and section, north of, behind and below No. 1 Hole.

Thirty-four (34) samples were taken for a total length of 270 feet. (Length of Hole - 498 feet)

The sections and average assays were:-

100 to 225 - 125 Feet @ 0.092% Copper.
High Assay - 0.18% over 10 feet.
Low Assay - 0.05% over 10 feet.

249 to 253 - 4 Feet @ 0.58% Copper.

274 to 362 - 88 Feet @ 0.12% Copper.
High Assay - 0.21% over 10 feet.
Low Assay - 0.04% over 6 feet.

362 to 379.5 - 17.5 Feet @ 1.73% Copper.
High Assay - 3.12% over 5 feet.
Low Assay - 0.40% over 2.3 feet.
(SEE DETAIL SECTION BELOW.)

379.5 to ~~405~~ 415 - 25.5 Feet @ 0.20% Copper.
High Assay - 1.04% over 6 inches.
Low Assay - 0.12% over 9 feet.

NOTE - The continuous section, from 274 to ~~405~~ 415 feet or ~~131~~ 141 feet, averaged 0.342% Copper.

ALLEN W. JECKELL
PROFESSIONAL MINING ENGINEER

The DETAIL SAMPLING and individual assays of the Section 362 to 379.5 feet or 17.5 feet of core follows:-

362 to 363.5 - 6" of well disseminated sulphides and 1 foot of fine disseminated - also ¼" seam, iron stained and carbonate filled, some molybdenite.
- SAMPLE NO. 1 - for 1.5 Feet @ 0.54% Copper.

363.5 to 366.2 - Highly fractured, Quartz filled with 3% sulphides, pyrite and chalcopyrite.
- SAMPLE NO. 2 - for 2.7 Feet @ 2.50% Copper.

366.2 to 366.4 - 2" Fault seam, iron stain and carbonate filled at 30 Degrees to core-axis, no mineral.
- NO SAMPLE - for 0.2 Feet @ nil.

366.4 to 368 - Highly fractured Quartz diabase, 5% sulphides in dissemination and threads.
- SAMPLE NO. 3 - for 1.6 Feet @ 2.24% Copper.

368 to 373 - Highly fractured, 5 to 7½% sulphides, pyrite, chalcopyrite, iron stain and some rose Quartz.
- SAMPLE NO. 4 - for 5.0 Feet @ 3.12% Copper.

373 to 375.3 - Fractured Quartz diabase, minor threads and seams, pyrite and chalcopyrite.
- SAMPLE NO. 5 - for 2.3 Feet @ 0.40% Copper.

375.3 to 379.5 - Fractured reddish brown Quartz, minor pyrite and chalcopyrite threads in all directions.
- SAMPLE NO. 6 - for 4.2 Feet @ 0.61% Copper.

NOTE - Sample No. 2 assayed Gold 0.01 ounce and Silver 0.17 ounce.
Sample No. 4 " " 0.02 " and " 0.34 ounce.

DEVELOPMENT BY DIAMOND DRILLING - Additional Contract.

With immediate and required assessment work completed, the next 2651 feet of diamond drilling was distributed to Holes Nos. 7, 8, 9, 10, 11 and so directed as to define and extend the intersection, given above in detail, of No. 3 Hole.

The following table lists, by date, the sequence in which the various holes were drilled:-

Preliminary Holes

Date - 1964 From	—	To	Hole No.	Feet	Cumulative Footage
May 24	-	May 29	1	560	560
June 1	-	June 7	3	498	1058
June 8	-	June 14	5	390	1448
June 16	-	June 18	6	400	1848
June 20	-	June 21	4A	84	1932
June 23	-	June 26	4	403	2335

Additional Contract

Date - 1964 From	-	To	Hole No.	Feet	Cumulative Footage
June 27	-	July 2	7	450	2785
July 4	-	July 9	8	499	3284
July 10	-	July 13	9	500	3784
July 16	-	July 18	7	200 (deepen)	3984
July 20	-	July 24	10	503	4487
July 26	-	July 31	11	498	4986

Assessment Hole

Aug. 1	-	Aug. 6	"A"	398	5384
Aug. 21	-	Aug. 21	"A"	53	5437

HOLE NO. 7 - Line 200 East - 1410 feet north.

- This hole was drilled at 45° on same line and section at one-half way between Nos. 1 and 3 Holes.

Forty-one (41) samples were taken for a total length of 232 feet. (Length of Hole - 650 feet)

NOTE - This hole was originally drilled to 450 feet. Sample No. 85 for 447 to 449 feet or 2.0 feet assayed 2.22% Copper, (See Detail Section below, - 416 to 464 feet.) and was later deepened to 650 feet.

There was evidence of chalcopyrite mineralization in 74% of the core (480 feet) with the barren sections amounting to 118 feet of scattered volcanics, 40 feet of Quartz Felsite Porphyry and 12 feet in one fault. Some 48.3% of the mineralized core was sampled and assayed.

The sections and average assays were:-

104.5 to 125 - 20.5 Feet @ 0.18% Copper.
High Assay - 0.27% over 5 feet.
Low Assay - 0.08% over 5 feet.

167.5 to 170 - 2.5 Feet @ 0.41% Copper.

181.0 to 192.5 - 11.5 Feet @ 0.10% Copper.

295 to 300 - 5.0 Feet @ 0.20% Copper.

404.5 to 416 - 11.5 Feet @ 0.114% Copper.

416 to 464 - 48 Feet @ 0.50% Copper.

- In Detail:-

- 416.0 to 419.0 —	3.0 Feet	@ 0.75%	
419.0 to 423.3 —	4.3 "	@ 0.11%	
423.3 to 428.3 —	5.0 "	@ 0.18%	
428.3 to 430.0 —	1.7 "	@ 0.07%	- Low Assay.
430.0 to 433.0 —	3.0 "	@ 1.62%	
433.0 to 440.0 —	7.0 "	@ 0.06%	
440.0 to 447.0 —	7.0 "	@ 0.11%	
447.0 to 449.0 —	2.0 "	@ 2.22%	- High Assay.
449.0 to 455.0 —	6.0 "	@ 0.22%	
455.0 to 459.0 —	4.0 "	@ 0.42%	
459.0 to 464.0 —	5.0 "	@ 1.37%	

464 to 536.5 -72.5 Feet @ 0.132% Copper.
High Assay - 0.51% over 5 feet.
Low Assay - 0.01% over 8 feet.

536.5 to 548.5 - 12 Feet - FAULT.

564 to 604 - Quartz Felsite Porphyry.

604 to 642 - 38 Feet @ 0.324% Copper.

- In Detail:-

- 604 to 610 —	6 Feet	@ 0.32%	
610 to 615 —	5 "	@ 0.25%	
615 to 620 —	5 "	@ 0.35%	
620 to 624 —	4 "	@ 0.36%	
624 to 627 —	3 "	@ 0.46%	
627 to 635 —	8 "	@ 0.16%	
635 to 642 —	7 "	@ 0.47%	

NOTE - At 648 feet a SPECIMEN, showing Quartz Stringers containing cluster chalcopyrite and bornite, is held for inspection.

HOLE NO. 8 - Line 100 East - 1500 feet north.

- Drilled S 27 W at 45 Degrees, this hole is parallel to and 100 feet west of No. 3 Hole.

Forty-four (44) samples were taken for a total length of 307 feet. (Length of Hole - 499 feet)

The sections and average assays were:-

10 to 18.5 - 8.5 Feet @ 0.11% Copper.

18.5 to 50.0 - 31.5 Feet @ 0.435% Copper.

OR

18.5 to 28.5 - 10.0 Feet @ 0.983% Copper.

- In Detail:-

- 18.5 to 23.0 -- 4.5 Feet @ 1.45%
  23.0 to 27.0 -- 4.0 Feet @ 0.56%
  27.0 to 28.5 -- 1.5 Feet @ 0.71%

50.0 to 104.5 - 54.5 Feet @ 0.09% Copper.

116.0 to 135.0 - 19.0 Feet @ 0.13% Copper.

151 to 160 - 9.0 Feet @ 0.09% Copper.

168 to 169 - 1.0 Feet @ 0.32% Copper.

289 to 418 - 129.0 Feet @ 0.132% Copper.
High Assay - 0.90% over 5 feet.
Low Assay - 0.02% over 10 feet.

418 to 444.5 - 26.5 of FAULT.

444.5 to 475.0 - 30.5 Feet @ 0.264% Copper.

- In Detail:-

- 444.5 to 456.5 -- 12.0 Feet @ 0.13%
  456.5 to 463.0 -- 6.5 Feet @ 0.27%
  463.0 to 467.0 -- 4.0 Feet @ 0.52%
  467.0 to 472.5 -- 5.5 Feet @ 0.19%
  472.5 to 475.0 -- 2.5 Feet @ 0.65%

475 to 499 - 24.0 Feet @ 0.127% Copper.

HOLE NO. 9 - Line 200 East - 1650 feet north.

- Drilled S 27 W at 45 Degrees. This hole was collared 155 feet north of No. 3 Hole to drill behind and underneath No. 3 and in the same section as Holes No. 7 and No. 1 which are south of Hole No. 3.

Twenty-four (24) samples were taken for a total length of 142.6 feet. (Length of Hole - 500 feet)

The sections and average assays were:-

90.5 to 124.5 - 34.0 Feet @ 0.222% Copper.
High Assay - 0.99% over 1.5 feet.
Low Aseay - 0.05% over 4.5 feet.

124.5 to 125.3 - 10 inch FAULT.

137.0 to 143.6 - 6.6 Feet @ 0.09% Copper.

267.0 to 340.0	-	73 Feet @ 0.135% Copper. High Assay - 0.48% over 4.5 feet. Low Assay - 0.04% over 10 feet.
340.0 to 360.0	-	20 Feet @ 0.055% Copper.
451.0 to 458.0	-	7 Feet @ 0.215% Copper.
477.0 to 479.0	-	2 Feet @ 0.20% Copper.

HOLE NO. 10 - Line 100 East - 1650 feet north.

\- Drilled S 27 W at 45 Degrees. This hole was collared 150 feet north of No. 8 Hole and is parallel to and 100 feet west of No. 9 Hole.

Fourteen (14) samples were taken for a total length of 89 feet. (Length of Hole - 503 feet)

The sections and average assays were:-

28 to 29.5	-	1.5 Feet @ 0.84% Copper.
97.0 to 102.5	-	5.5 Feet @ 0.25% Copper.
228.0 to 236.0	-	8 Feet @ 0.40% Copper.
266.0 to 286.0	-	20 Feet @ 0.125% Copper.
449.0 to 482.0	-	33 Feet @ 0.22% Copper. High Assay - 0.80% over 1 foot. Low Assay - 0.08% over 5 feet.
482 to 503	-	21 Feet @ 0.114% Copper.

HOLE NO. 11 - Line 200 West - 1940 feet north.

\- Drilled S 27 W at 45 Degrees.

\- This hole was collared some 400 feet true north and 100 feet true west of the collar of No. 10 Hole to intersect an anomalous cross-over on line 200 West at 1740 feet north.

At this stage in the drilling program, it was becoming evident that the major structural control of brecciation, certain faulting with attendant chalcopyrite mineralization, might lie in a N 17 W direction with a possible steep dip to the south-west.

On the basis of this assumption and in keeping with the program of testing the multiple E-W cross-overs, two holes, Nos. 11 and 12, were spotted.

Structure in No. 11 Hole was similar to that intersected in Nos. 1, 3, 7, 8, 9 and 10. However, the degree of chalcopyrite mineralization was not as strong, although the incidence of mineralization throughout the range of the hole was greater than the sampling as listed.

The sampling and average assays were:-

31.5 to 33.0	-	1.5 Feet @ 0.81% Copper.
82.0 to 104.0	-	22.0 Feet @ 0.085% Copper.
173.0 to 181.0	-	8.0 Feet @ 0.20% Copper.
200 to 237.8	-	37.8 Feet @ 0.138% Copper. High Assay - 1.75% over 0.8 foot. Low Assay - 0.11% over 12 feet.
~~408~~ 409 ~~300~~ to ~~408~~	-	1.0 Foot @ 1.00% Copper.

Ans.

ASSESSMENT HOLE NO. "A" - Line 200 West - 1150 feet south.

- Drilled N 27 E at 45 Degrees.
(Length of Hole - 451 feet)

- This hole was drilled to supplement assessment work for one of two contiguous groups of Claims and in order to test the strongest area of a Self-Potential Geophysical Survey which had been undertaken under vendor auspices. The locale also was the site of a smaller Low-High-Low Magnetic anomalous area, with a weak electromagnetic anomalous cross-over some 200 feet to the east.

There was scattered sulphide mineralization noted in the core. A fault zone from 327 to 340 feet was intersected. None of the mineralization required sampling.

Special specimens at 377 to 378 feet of 1" Quartz Stringers containing chalcopyrite were held for visual inspection.

GEOLOGY AND STRUCTURE - Local.

Rock classification is within a narrow range.

The greater proportion of the mass intersected by the drill holes has been identified as Quartz diabase which, by granular texture, grades into a phase that could be considered a gabbroic diabase. Lesser sections of core appear to have the appearance of volcanic lavas, but it is difficult to establish exact contacts. It is, however, noted that the

siliceous content of the various rock formations changes in a marked degree at a point of carbonate filled fault markers, viz., a sudden cut-off of a granular diabase to a phase of volcanic lava or fine grained Quartz diabase. At this date, it is considered that the volcanics have a general E-W strike and a flat dip to the north.

A single intrusive rock type has been noted and classified as a Quartz Felsite Porphyry. It is fine grained and uniform throughout to either contact with no alteration to the contacted rock formation. This porphyritic formation is considered to occur as steep dipping dikes along a general N-S strike.

Copper sulphide mineralization does not appear to be confined or controlled by any particular rock formation as it is found in varying degree in all classifications.

Such mineralization is associated with a Quartz or siliceous phase of intrusion which has followed and filled channels originally opened by N-S faulting which shattered adjacent formations.

The resultant channels comprise Quartz filled brecciated faults, stringers from ½ inch up, seams at ¼ inch and numerous cracks which, in the Drill Logs, are noted as "threads". It is also noted that certain "granitization" or siliceous alteration generally carries appreciable copper values, particularly in the vicinity of Quartz filled brecciated faults.

There is a paucity of pyrite throughout the shattered and mineralized zones and therefore such zones cannot be classified as replacement type deposits.

Later major faulting, typified by barren carbonate filled breccia, has offset such mineralized shatter zones and also the porphyritic dikes. The attitude of such later faulting is still unknown but, by intersection in three holes, might be flat lying (near horizontal).

Accordingly, the sense without proof or argument is that the attitude and degree of copper sulphide mineralization is controlled by early N-S faulting in a vertical plane, all of which has been offset by later flat lying major faulting.

GEOLOGY - ECONOMIC - Local.

A perusal of the samplings and assays as given herein (Holes Nos. 1, 3, 7, 8, 9, 10 and 11) shows that no economic copper ore has been found in this preliminary drilling.

However, certain sections of core have returned appreciable values and/or impressive lengths of consistent copper content. It will be noted that such sections have been reported "In Detail".

At the same time, it should be appreciated that the drill hole sections (some 300 feet on line by 400 feet at 45 Degrees on one section and 100 feet on line by 400 feet at 45 Degrees on a second section which is 100 feet distant) have tested a relatively small proportion of the overall dimension of the anomalous formation or mass. Such anomalous formation is considered to have a length of 2400 feet and potential maximum width of 800 feet.

The degree of mineralization, hence grade of copper, is in proportion to the degree of brecciation and shattering. The preliminary drilling was directed to test anomalous conditions and determine whether sulphides and of what type were the causation of such anomalies. As this has now been determined, it should follow that testing should continue in order to locate and define the zonal areas that carry the maximum brecciation and shattering.

The magnetometer survey and E-M anomalous "cross-overs" suggest a potential fractured and mineralized zonal trend along a N 18 W axis, namely, the 2400 feet mentioned above.

GEOLOGY AND STRUCTURE - General.

Certain current diamond drilling on property held by McKinney Gold Mines Ltd., notably on Claim SSM-67726, Kincaid Township and some 1¼ miles distant in a N 30 W direction from the location of Jogran Mines drilling, is testing a mineralized formation, viz., a fault zone having a similar N W strike trend.

This fault zone trend is also noticeable as crossing the intervening acreage on strike between the two drilling sites. This intervening or middle acreage is the locale of iron formation which, according to air-borne magnetometer survey, shows a "break" or separation in magnetic intensity which coincides with the above-mentioned fault trend. The eastern portion of the iron formation is displaced southerly in relation to the western portion.

A perusal of Aeromagnetic Map 2188G - Mica Bay Sheet also shows that a series of magnetic contours suggest faulting of similar strike at and west of the Pancake - Mamainse Lakes area.

It is also noted that the "C" zone and the zone of "Old Indian Copper Diggings" on and at the mining property of Coppercorp Ltd. (Montreal Mining Co. - Sand Bay Location), show a N 15 W and N 20 W strike length respectively. NOTE - See Ontario Department of Mines Map No. 1953-1, Mamainse Point Copper Area.

ASSESSMENT REQUIREMENTS AND STATUS.

Sufficient diamond drilling has been completed to cover the total assessment work of 200 days per Claim as required by the Ontario Mining Act.

ALLEN W. JECKELL
PROFESSIONAL MINING ENGINEER

For 21 claims, 4200 days of work are required. Diamond drilling has amounted to 5437 feet or days.

However, all of this assessment work has not been filed at this date. It will be noted that all of the 21 claims are secured by filed and accepted "Reports of Work" up to and including 1965, and all but 6 claims until 1966.

See Table under "Identification of Property and Location" herein.

CONCLUSIONS.

In my Report of November 8th, 1963, I stated under "Conclusions" that --

Quote - "It is considered that prior to the current summer (1963) season, the use of modern geophysical survey methods has not played a part in wide-spread and detailed prospecting of this area."

"Therefore, it is possible that the use of such methods and application to the greater proportion of the area may be instrumental in locating additional copper deposits."

"Such deposits are likely to be located in and along the juncture of or trace of structural faulting and in the near vicinity of minor and mineralized 'showings' which have been identified in the past."

"These conditions have been established, in part, within the boundary of the mining claims discussed herein." - Unquote.

The ground geophysical survey of the area of the aeromagnetic "Low" anomaly was instrumental in guiding the subsequent Preliminary Diamond Drilling Program into structural formation that disclosed copper sulphide mineralization which was new and heretofore unknown.

Although the diamond drilling, so far, has failed to disclose economic copper ore, there is no reason to terminate development.

It is my contention that a very small percentage of the anomalous mass has been partially tested.

The anomalous conditions persist south-easterly from the sections exemplified by Diamond Drill Holes 1, 3, 5, 7, 8, 9 and 10 for a distance of some 1200 feet.

In addition, and at this stage of development, an effort should be made to expurgate the probability that the control of mineralization might be in a horizontal attitude.

With these factors in mind and accepting the fact that weather conditions of this area will deteriorate in late November to a point where diamond drilling is difficult and costly, a recommendation on immediate and additional development is modified by specific reservations.

Therefore, for the remaining current season, a minimum program of diamond drilling which could lead to, locate and find structural conditions, hence tonnage, that would yield a copper content of economic grade, should be considered and does not detract in any manner the potential characteristics and merit of the property and the mineralization therein.

RECOMMENDATION.

Based on the premises expounded under "Conclusions", a program of diamond drilling in the amount of 2500 feet to be expended in five (5) holes is recommended.

The arrangement of the five (5) holes is described thus:-

First Hole - At site of No. 1 (Preliminary Program).
To be drilled @ 90 Degrees for 500 feet to determine and/or disprove the probability of a flat dip to the attitude of known mineralization.

Second Hole -Site of collar at 700 North and 450 East.
To be drilled N 80 E @ 45 Degrees for 500 feet to test the E-M anomalous "cross-over" and "High-Low" magnetometer contact at the site of the original and undrilled No. 2 Hole of the Preliminary Program.

Third Hole - To be drilled parallel to and 300 feet south of the second hole @ 45 Degrees for 500 feet.

Fourth Hole -To be drilled parallel to and 600 feet south of the second hole @ 45 Degrees for 500 feet.

Fifth Hole - To be drilled parallel to and 900 feet south of the second hole @ 45 Degrees for 500 feet.

NOTE - The third, fourth and fifth holes are exploratory or preliminary holes located in such a manner as to test the south-easterly extension of the assumed N 18 W strike fault zone.

COST OF ADDITIONAL DRILLING PROGRAM.

1. Diamond Drilling, extras - 2500 feet at $4.00 per foot	$10,000.00
2. Supervision, travel, assaying, et al.	$ 5,000.00
Total ...	$15,000.00

PROVINCE OF ONTARIO

- C E R T I F I C A T E -

I, ALLEN WRAY JECKELL, of the City of Toronto, in the County of York, do hereby certify as follows:-

1. THAT I am Consulting Mining Engineer and have practised my profession in excess of thirty years.

2. THAT I live at 5 Walmsley Boulevard, Toronto 7, Ontario.

3. THAT I am a Registered Professional Engineer in the Province of Ontario and in the Province of Quebec.

4. THAT I am a Graduate Mining Engineer with the Degree of Bachelor of Applied Science (1927) of the University of Toronto.

5. THAT this Progress and Development Report, dated October 15th, 1964, which covers the development work undertaken on the Jogran Mines Ltd. mining property in Ryan Township, has been made on behalf of McKinney Gold Mines Ltd., Suite 506, 540 Burrard Street, Vancouver, British Columbia.

6. THAT the content of this Progress and Development Report is based on personal supervision and resident direction of the Diamond Drilling and other development during the period February 27th to August 21st, 1964.

7. THAT I have no interest either directly or indirectly in this mining property nor do I expect to receive any interest directly or indirectly in the securities of Jogran Mines Ltd. or McKinney Gold Mines Ltd.

DATED this 15th day of October, 1964.

Allen W. Jeckell, B.A.Sc., P.Eng.,
Consulting Mining Engineer.

PREAMBLE

Subsequent to my General Report of November 8th, 1963, which was used to qualify an underwriting of McKinney Gold Mines Ltd. shares, a geophysical survey by Magnetometer and Electromagnetic methods was completed on the greater part of (11) eleven eastern claims. Final geophysical maps and reports were received late January 1964.

Based on the findings of this Geophysical Report and other data contained in my November 8th, 1963 Report, a preliminary Diamond Drilling Program, for a minimum 2500 footage to be expended in six (6) holes was recommended in my Report of February 27th, 1964.

This diamond drilling program covered the period, - May 24th to August 21st, 1964 and was expanded to twelve (12) holes totalling 5437 feet following on the finding and intersecting of copper sulphide mineralization.

A Progress Report, dated October 15th, 1964, covered the results and findings from this diamond drilling, and under Recommendations, page 14, a further program involving five (5) holes for 2500 feet was suggested.

This program was underway by December 3rd, 1964 with No. 12 Hole completed to 500 feet by December 13, 1964.

Following the holiday season continuous drilling, of Holes No. 13 to No. 21 inclusive, was undertaken. These nine (9) holes were located in an area somewhat removed to the south-east from the earlier area of drilling. The nine (9) holes were located or positioned to intersect geophysical data and geological suppositions which were described within the text of the October 15th, 1964 report.

In total, this drilling program which was recommended at five (5) holes for 2500 feet was increased to ten (10) holes and a total footage of 5698 feet.

Therefore, as of March 21st, 1965, a grand total of 11,135 feet of AXT Diamond Drilling in 21 holes has been completed.

A complete set of reports, maps, plans, cross-sectional drawings, diamond drill records including sampling and assaying records have been presented to the Regional and Resident Geologist and are on file at his office at Sault Ste. Marie, Ontario.

DIAMOND DRILL HOLES

NO. 12 HOLE - This hole was drilled vertically to a depth of 500 feet for the purpose of determining and/or disproving the attitude of known Copper Mineralization previously cut in Hole No. 3 (17.5 feet @ 1.73% Copper, - at 290 foot vertical depth below the collar of No. 1 Hole); in Hole No. 7 (48 feet @ 0.50% Copper, - at 318 to 357 feet vertical depth); and in Hole No. 8 (30.5 feet @ 0.264% Copper, - at 333 to 355 foot vertical depth).

Several sections of copper mineralization were intersected in No. 12 Hole thus:-

13	to	54.5 ft.	or	41.5	ft.	@	0.272%
58.5	to	83 ft.	or	24.5	ft.	@	0.205%
105	to	125 ft.	or	20	ft.	@	0.332%
174	to	177 ft.	or	3	ft.	@	0.45%
194	to	200 ft.	or	6	ft.	@	0.25%
254	to	260 ft.	or	5.5	ft.	@	0.21%
and at 316.5	to	322 ft.	or	5.5	ft.	@	4.03%

The latter section was made up of two consecutive samples, namely:- 2.5 feet @ 5.46% Copper, - 0.035 oz. Gold and 1.13 oz. Silver and 3.0 feet @ 2.84% Copper, - 0.01 oz. Gold and 0.35 oz. Silver. The section was at a vertical depth of 315 to 322 feet in relation to intersections in Holes 3, 7 and 8 mentioned above.

The hole also intersected the postulated north-south fault at 475 to 497 feet, in keeping with the pre-determined dip of 60 to 75 degrees to the East.

QUARTZ FELDSPAR PORPHYRY AREA

As stated above, holes No. 13 to 21 inclusive were located south-east of previous drilling and at a much lower but unknown horizon. (Estimated 150 to 250 feet lower than the collar of No. 1 Hole).

NO. 13 HOLE - This hole was positioned to cross-section certain geophysical data and geological suppositions which were arrived at from previous drilling.

It was directed S-50-W at 45 degrees for 500 feet and cut 483 feet of continuous mineralization averaging 0.270% Copper and 0.068% Molybdenite (MoS_2). The first 197 feet of core showed iron stained reddish brown quartz feldspar porphyry which averaged 0.263% Copper and 0.082% MoS_2. This was followed by 31.5 feet of sheared and fractured volcanic lava which averaged 0.345% Copper and 0.130% MoS_2. Porphyry was then intersected for an additional 82 feet averaging 0.300% Copper and 0.052% MoS_2. The next 45.5 feet of volcanics averaged 0.437% Copper and 0.041% MoS_2.

NO. 14 HOLE - This hole was spotted prior to receiving core from No. 13 Hole. It was collared some 125 feet north of No. 13 but drilled S-76-W at 45 degrees and at a diverging angle of 26 degrees northerly from the direction of No. 13.

The hole was originally scheduled to be drilled to 500 feet with later instruction to continue as long as copper mineralization was noted. The hole ended at 678 feet. The upper 522 feet of continuous mineralization averaged 0.180% Copper and 0.053% MoS_2. However, the porphyry was noted only in the first 77 feet of core and averaged 0.260% Copper and 0.117% MoS_2. A faulted zone in volcanics, from 352.5 to 395 or 42.5 feet averaged 0.415% Copper and 0.057% MoS_2. At 485 feet a highly fractured Quartz Felsite was encountered, continuing for 168 feet. The upper 47 feet, above a 5 to 7 foot fault, averaged 0.212% Copper and 0.037% MoS_2. This fault is considered to be the southward and down-dip extension of the north-south fault postulated from the 1964 drill program.

- - - - - - - - - - - - - - - - - - -

Subsequent drilling plans were changed in order to primarily outline the vertical dimension and some of the lateral dimension of the porphyry.

NO. 15 HOLE - This was a vertical hole some 50 feet S-50-W of the collar of No. 13 hole. Instructions were given to drill as long as mineralized porphyry was being recovered (700 rod limit). Continuous porphyry was intersected to 575 feet. The upper 381 feet of porphyry averaged 0.227% Copper and 0.050% MoS_2. The lower contact in relation to the similar porphyry - volcanic contact in No. 13 hole returned a plus-minus angle of 80 degrees to the north-east.

NO. 16 HOLE - Collared 220 feet east of No. 13, was drilled S-48-W at 45 degrees parallel to and some 100 feet south-east of No. 13. The greater length of core for 543.5 feet averaged 0.232% Copper and 0.054% MoS_2. The porphyry section of 500 feet averaged 0.230% Copper and 0.056% MoS_2.

NO. 17 HOLE - Collared at the same set-up as No. 16, but drilled N-48-E at 45 degrees or in the opposite direction to No. 16 intersected 459.5 feet of continuous porphyry establishing one horizontal dimension on cross-section of the porphyry at 650 feet. The entire length of porphyry to 459.5 feet was mineralized with the upper 133.5 feet averaging 0.143% Copper and 0.043% MoS_2.

NO. 18 HOLE - Collared at the site of No. 16 and No. 17 and drilled vertically intersected continuous mineralization in porphyry to the total depth of hole at 680 feet. The upper 250 feet of core averaged 0.174% Copper and 0.033% MoS_2.

NO. 19 HOLE - Collared some 110 feet north of the site of holes 16, 17 and 18 was directed S-80-W at 50 degrees in the same general direction and underneath No. 14. Mineralization was noted in the first or upper 351.5 feet of core. The upper 227.5 feet (215 feet of porphyry) averaged 0.201% Copper and 0.042% MoS_2.

NO. 20 HOLE - Collared at the same location as No. 19, the hole was directed S-55-W at 50 degrees toward and underneath No. 13 hole. The hole intersected 724 feet of continuous mineralized porphyry with the upper 400 ft. averaging 0.159% Copper and 0.048% MoS_2.

NO. 21 HOLE - Collared at the same location as No. 19 and 20 holes, was drilled vertically to 497 feet. It intersected 254 feet of porphyry averaging 0.129% Copper and 0.047% MoS_2, with a greater length of core including 66 feet of underlying volcanics for a total depth length of 320.5 feet averaging 0.130% Copper and 0.057% MoS_2.

ALLEN W. JECKELL
PROFESSIONAL MINING ENGINEER

Indications of Tonnage and grade of Mineralization

The dimension of tonnage potential and uniform distribution of mineralization combined with certain topographical features and the very shallow depth of overburden allow consideration of an open-pit mining operation. It is admitted that, at first instance, the measured percentages of Copper and Molybdenite appear to be below economic value.

It is proper and expedient to mention that certain but incalculable losses of mineralization were incurred during drilling with AXT core. This was noticeable in the more heavily Copper mineralized sheared zones and multiple Quartz stringer zones. Molybdenite loss was the more important or severe. It was noted that wider (1" to 2") intersected quartz stringers and fault seams which carried coarse crystal Molybdenite failed to remain intact, being recovered with visible loss of the soft but massive molybdenite. Sludge samples were not taken during this drilling. It is doubtful if such samples would be of use to prove or disprove such loss.

The nine (9) holes which have been drilled in the Porphyry Area can only be considered as "indicators" of grade of mineralization and are of a preliminary nature in outlining the dimension and extent of mineralization in the porphyry and attendant fault shearing within the western third of the mass.

Therefore, it is premature at this stage of development to attempt to arrive at a concise or intelligible estimate of tonnage and/or grade of mineralization. Such estimates can only be arrived at through further drilling, large NXR core drilling and underground bulk sampling.

The nine (9) holes, however, may be grouped in and according to what is considered to be three (3) cross-sections at right angles to the structural features (faults and drag-shears) of the mineralized mass (porphyry and volcanics).

(1) Grouped as the "Northern Section" (S-76-W) are Holes No. 14, 19 and 21.

The lineal footage of sampled and assayed core which might be part of and within an open-pit dimension amounts to 1070 feet and averages 0.170% Copper and 0.052% of MoS_2.

An indicated tonnage potential as ascertained from below the collars of the holes and not including potential tonnage from the rise of hill over the western hole No. 14 amounts to 14,210 tons per lineal foot of "strike" length or 1,421,000 tons per 100 feet of "strike"length (50 feet either side of section). Factor used as 12.

(2) Grouped as the "Center Section" (S-50-W) are Holes No. 13, 15, 20 and 21.

The lineal footage of sampled and assayed core which might be part of and within an open-pit dimension amounts to 1,584.5 feet with an average of 0.204% Copper and 0.057% MoS_2.

An indicated tonnage potential as ascertained from below the collars of the holes and not including potential tonnage from the rise of hill over the western hole No. 13, amounts to 22,345 tons per lineal foot of "strike" length or 2,234,500 tons per 100 foot "strike length".

(3) Grouped as the "Southern Section" (S-48-W) are Holes 16, 17 and 18.

The lineal footage of sampled and assayed core which might be part of and within an open-pit dimension amounts to 912 feet and averages 0.204% Copper and 0.047% MoS_2.

An indicated tonnage potential as ascertained below the collars of the holes amounts to 25,380 tons per lineal foot "strike" length or 2,538,000 tons per 100 feet of "strike" length.

The Over-all Average grade of mineralization based on the lineal footage of sampled and assayed core of the nine (9) holes and/or that part of the mass which might be within an open-pit dimension becomes 3,566.5 lineal feet averaging 0.1935% Copper and 0.0528% MoS_2.

At this point, it should be pointed out that the potential "strike" length dimension within the boundaries of the property and along which copper mineralization and some molybdenite mineralization has been disclosed, is considered to be 3,200 feet in a general north-south direction.

The potential "width" within which this mineralization may be present is 600 to 800 feet.

The "porphyry" portion as outlined at present by the nine (9) holes covers some 400 feet of the "strike" length with horizontal widths of 600 feet on all three cross-sections.

A narrow strip to the north and on the western limits of an 1100 foot length and 100 feet plus width has been partially drilled by the preliminary holes reported October 15th, 1964. It is now considered that this preliminary drilling was directed in a direction somewhat parallel to the structural (faulting) characteristic of this length. Although some molybdenite was noted along this strip, no systematic assaying for this mineral was undertaken.

The porphyry area is open to the south-east for some 4 to 600 feet on "strike" length.

CONCLUSIONS

The latter diamond drilling program, described herein, has disclosed a comparatively large and partially dimensioned igneous mass of quartz feldspar porphyry which is mineralized with chalcopyrite, molybdenite, and lesser amounts of pyrite, pyrrhotite, barium, titanium, zirconium and vanadium.

The chalcopyrite-molybdenite percentages are of a higher tenor in the western one-third of the mass, due to a second-stage period of mineralization through and following channels opened by faulting and drag folding and shearing.

It has been proved that the incidence of the aerial magnetic "low" anomaly and the ground magnetometer "low" anomaly is due to the existance of this mass of porphyry.

The resident government geologist, Dr. Giblin, has commented (verbally) that this porphyry is the first and only occurrence of a "copper porphyry" intrusive that has come to his attention within the area of the District of Algoma. He considers that it is unique in this respect and whether it carries sufficient mineralization to be classed as an economic deposit or not, it is of academic and geological importance in so far as it assists in establishing one type of igneous magmatic source for the wide-spread distribution and deposit of copper bearing minerals within the general Batchawana Area.

It should follow that the immediate area of such an intrusive porphyry is a most likely area in which to explore for and develop mineralized structural faults, shear, shattered and/or brecciated zones.

It is my premise that such structural conditions occur within the boundaries of your property and, also by inference and demonstrated fact to occur along a fault zone and within an elongated area to the north for a distance of one and three quarter (1-3/4) miles to the location where diamond drilling on the property of McKinney Gold Mines Ltd. (just south of Pancake Lake) has disclosed copper mineralization of appreciable amount.

It is my opinion that acquisition of additional claims located between the two tested zones be undertaken in the near future. Such acquisition has been outlined in my letter (including maps) of November 20, 1964. My recommendations, as stated in that letter are still valid at current date.

The next stage in development, by necessity, must be undertaken within the terms of a program requiring the supply of funds on a larger scale than have previously been available.

To this end, overtures should be made to the exploration departments of the larger and more affluent mining organizations in order to solicit their interest and financial assistance in furthering the development of

your property. The optioning of the additional and intervening claims, at this stage and under Company auspices, appears to be an expedient acquisition.

RECOMMENDATIONS

Further and continued development of this property is recommended.

In order to carry this development forward, several current, initial and/or imperative expenditures should be provided for.

Item 1.

Sufficient funds must be provided to maintain current Company expenditures for legal, registration, consultant services, travelling and general expenses. (Rental at Sault, etc.).

Item 2.

An initial grid and transit survey at 200 foot intervals or stations, oriented on a north-south axis and complete with elevation control and topographical contouring at 5 foot interval is requisite. At the present time it is impossible to accurately orient or establish elevation control of the completed diamond drill holes and their content.

Item 3. Company Accommodation

A start on accommodation at the property for Company personnel must be considered. This accommodation should be of semi-permanent construction (not tents) and of such a design that it can be winterized (insulated).

Certain delayed operations must also be considered and funds provided for:-

Item 4. Property (claims acquisition)

The acquisition by option of a minimum four (4) claims should be advanced. These claims are: SSM - 59850, 1 and 3; also 69515, restaked as 74754, Ryan Township.

Item 5.

A base-line transit survey of one and 3/4 miles connecting the two known mineralized zones and with elevation control and stations at 400 foot spacing is required prior to the advancement of Item 6.

Item 6.

Subsequent line cutting, geophysical and geochemical survey over a minimum 600 foot width to either side of the above base-line should be the first operation in exploring the intervening acreage on line of "strike".

Item 7. Laboratory Metallurgical Testing

Certain initial laboratory grinding and flotation tests should be advanced using the sample rejects from completed drill hole core.

Tests should cover (a) Porphyry type copper-molybdenite mineralization, (b) Volcanic type copper-molybdenite mineralization and (c) probably a test of combined product (a) and (b).

Item 8.

Additional diamond drilling and assaying account.

Item 9.

Employment of resident geological and assistant personnel.

Item 10.

Acquisition of surveying and draughting equipment.

Item 11.

Senior supervision and/or consulting services.

COSTS

The posting of an itemized and estimated cost of a feasible development program requires the absorption and consideration of a numerous quantity of variable alternatives and with the exception of Item 1, listed under imperative expenditures, such an itemized estimate would be superfluous at this date.

Item 1. Current Company Expenditure

The sum of $3,000. to $3,500. per month is considered requisite for this purpose.

Item 2.

The grid and contour survey, while not an imperative and immediate item, is requisite to co-relate and intelligently present the two stages of diamond drill holes on and to a common and combined basis. The cost is estimated at $3,500. It would be performed by a four (4) man crew at a base cost of at least $120. per elapsed day and $6.00 per hour for draughting time.

Item 3.

Suitable accommodation at the property can be progressive. For summer use, the sum of $6,000. would be sufficient with approximately $1,500. for winterizing the buildings.

Item 4.

The cost of property acquisition is unknown and subject to negotiation.

Item 5.

The cost of the surveyed base-line would be appropriate to the rates quoted under Item 2, and could approximate $1,800.

Item 6.

The amount of and cost of geophysical and geochemical survay is subject to future discussion and decision as to the type of survey and the mileage or acreage covered.

Item 7.

Laboratory testing would range up to an estimated $2,000.

Item 8.

Diamond drilling base rates as currently experienced, viz., $3.00 per foot for actual hole and at $4.25 including moves, etc. Total cost, including assaying, core trays and racking, but not supervision for AXT core is estimated at $6.00 per foot.

The dimension of the indicated and mineralized area is large and 15 to 20,000 feet is not considered excessive or beyond the applicable "target" objective.

Item 9.

Services of one geologist and two assistant personnel is estimated at $2,200 per month.

Item 10.

Survey and draughting equipment is estimated at $1,800.

Item 11.

Senior supervision and/or consulting fee and expense estimated at $2,500. per month.

ALLEN W. JECKELL
PROFESSIONAL MINING ENGINEER

In general, the sum of $150,000. minimum should be considered as a requisite sum to further and to expedite the next phase of development. This amount should be made available at the rate of $22,000. per month over a seven month program.

The above minimum fund, is considered in my opinion, as an equitable expenditure for the continued development of your claims and acquired claims but if the property of McKinney Gold Mines Ltd., the acquired claims and your property were amalgamated under a new consolidation, a further sum would be required to expedite a still larger program.

I am thoroughly convinced that the mineralized structural zones that have been indicated by the development undertaken during the last year are only part of a larger and intruguing structure that could contain deposits leading to a large scale tonnage mining operation.

In other words, your property can be classed as one of only three development operations which have disclosed mineralization and potential tonnage in the general Batchawana Area of the District of Algoma.

This is my progress report on development operations during the period August 22nd, 1964 to June 11th, 1965.

NOT TO BE REMOVED FROM
THE OFFICE OF THE RESIDENT
GEOLOGIST, ONT. DEPT. OF MINES
SAULT STE. MARIE, ONT.

Dated - June 11th, 1965.

Respectfully submitted,

A.W. Jeckell

I, ALLEN WRAY JECKELL, of the City of Toronto, in the County of York, do hereby certify as follows:-

1. THAT I am Consulting Mining Engineer and have practised my profession in excess of thirty years.

2. THAT I live at 5 Walmsley Boulevard, Toronto 7, Ontario.

3. THAT I am a Registered Professional Engineer in the Province of Ontario and in the Province of Quebec.

4. THAT I am a Graduate Mining Engineer with the Degree of Bachelor of Applied Science (1927) of the University of Toronto.

5. THAT this Progress and Development Report, dated June 11th, 1965, which covers the development work undertaken on the Jogran Mines Ltd. mining property in Ryan Township, District of Algoma, Ontario.

6. THAT the content of this Progress and Development Report is based on personal supervision and resident direction of the Diamond Drilling and other development during the period August 22nd, 1964 to June 11th, 1965.

7. THAT I have no interest either directly or indirectly in this mining property nor do I expect to receive any interest directly or indirectly in the securities of Jogran Mines Ltd. or McKinney Gold Mines Ltd.

DATED this 11th day of June, 1965.

A. W. Jeckell

JOGRAN MINES LTD
No 19 D.D.H.

March 17th, 1965

Note - On February 24th, the rods were stuck in No 19 Hole at 276 feet. In pulling, a coupling stripped, allowing 95 feet of rods, 15-foot core barrel and bit to be stuck in the hole. On February 28th, a wedge was used at 170 feet and the rods were by-passed by re-drilling the hole. Subsequently, two cuts of core were available for inspection and sampling.

The following table shows the Assays from Samples for the original run and the second re-run:-

ORIGINAL RUN								SECOND RE-RUN							
Sample No	From	To	Core Length	%Cu	%ft	%FeS_2	%ft	Sample No	From	To	Core Length	%Cu	%ft	%FeS_2	%ft

ONTARIO

DIP - 45°
FOOTAGE - 451 ft.

DATE - August 1-6 and 21 - 1961

Drilled by - Continental D. D. Co.

Logged by - A.W. Jeckell, P. Eng.

FROM	TO	FOOTAGE	DESCRIPTION-
0	14		- Casing
14	95	81	- Volcanic, medium siliceous, mostly massive SPECIMENS at - 57, 88, 113, 120, 142, 193, 217 - 14 to 16.5' - Rusty, fractured, Qtz filled, pyrite - 75 to 95 - flow top, some vesicles
95	135	40	- Fine grained siliceous chloritic to Qtz diabase - One 1/4" Qtz seam and one 1/8" seam with chalcopyrite 2" apart at 110' @ 50° C/A - One 1" Qtz Stringer with Chalcopyrite (SPECIMEN 120) at 120' @ 55° - 1 1/2" fault seam, carbonate and Qtz Carbonate with little pyrite at 135' @ 40°
135	216	81	- Medium grained Qtz Diabase, few scattered threads pyrite & chalcopyrite
216	300	84	- Gradual change to dense fine grained Qtz Diabase - At 223' Qtz Stringer between 3" @ 60° - At 225' Seams 1/4" pyrite at opposite diagonal angles - at 249 to 250 Qtz Stringers 1/2" and 3/4" some 4" apart, cluster pyrite & chalcopyrite SPECIMEN 249-250 - From 250 on to fault at 327, considerable fracturing. - At 262.5 a 1/4" Qtz Carb. seam, 40 stain @ 35° - At 277.5 a 1/2" $CaCl_3$ seam at 20° - At 278.3 a 1/2" Qtz Carb seam, little chalco @ 40° opposing above 20° - At 279 a 1/4" Qtz Stringer, & little chalco @ 45° - From 279 to 300, fair fracturing, scattered threads with chalco with 1/2" Qtz Carb stringer seam @ 20° at 296.5' ft.
300	327	27	- Appears to be a flow top with siliceous alteration, some [illegible] threads with chalco but not enough to show more than 0.1% Cu/ft - At 310.5 - fault breccia seam @ 30° along 2 feet of core.
327	340	13	- FAULT, with - Qtz Carbonate and Breccia at 327 & 327.5

D.D. HOLE No "A"

FROM	TO	FOOTAGE	DESCRIPTION -
			- Shear at 330.5 @ 25° C/A
			- Stony breccia 332 to 332.5 feet
			- " " 337 to 339, & shear @ 25 to 30°, also fracture plane parallel to C/A
340	451	111	- Siliceous volcanic ? - SPECIMEN at 362'
			- Scattered seams & few threads
			- Special SPECIMEN 377 to 375 ft showing two 1" qtz stringers @ 50 and 45° with chalcopyrite
			- At 379' a 1" fault seam @ 20° C/A
			- At 388' a 1" qtz Carbonate seam
			- At 395.5 a 1/8" to 1/4" seam of sulphide, pyrite and chalcopyrite @ 90° C/A
			- At 401 a 1/8" seam pyrite, & silty sericite
			- Some mineralization 406 to 418 ft., 12 threads mostly pyrite. 1/8" seams at 407.5, 412, 413, 417, 419.5. - 1/2" sulphides, mostly pyrite at 407 @ 60° C/A
			- 1/2" sulphides, some chalcopyrite at 445.5 ft @ 60° (disrupted ?)
			- Scattered threads of pyrite 446 to 450.

END of HOLE

Date of Examination - 0 to 327 - On August 8th.
- 327 to 340 - On August 12th } 1964
- 340 to 451 - On September 26th }

TEST ANGLE - Misplaced ?

D.D. HOLE No 7.

FROM	TO	FOOTAGE	Description
170	to 181	11.0	- mostly barren dease
181	to 184.5	3.5	- Siliceous alteration, folding at 30° to C/A some fine threads — No 72 - 3.5' @ 0.08% Cu
184.5	to 192.5	5.0	- 20 threads and 2 elongated 1/4" seams @ 30° Py + Chalco — No 73 - 5.0 @ 0.12% Cu
192.5	to 197.5	5.0	- less fracturing, more dense
197.5	to 209.	11.5	- altered by siliceous solution, seams + threads all directions — No 74 - 11.5 @ 0.14 % Cu
209	to 220	11.0	- fractured, threads 5% — No 75 - 11.0 @ 0.07 % Cu
220	to 225	5.0	- 5 threads, 3 seams.
			Hardness of rock changes 223' to 225' but no particular contact
225	to 230	5.0	- 3 seams 1/8" to 1/4" and one 1/2" Qtz seam @ 60° to C/A
230	to 235	5.0	- 1/2" fault at 231' @ 45° C/A - balance of Qtz fault is :- barren Qtz Diabase and mineralization increases.
231	HCO	169'	- Quartz Diabase
235	to 235.5	3.5	- mostly barren
235.5	to 240	1.5	- folded with parallel C/A Qtz Stringer, pyrite and chalco
240	to 245	5.0	- 17 threads all directions, pyrite, chalco
245	to 250	5.0	- 15 threads " " "
250	to 255	5.0	- 3 threads and one 1/2" Qtz Stringer pyrite, chalco
255	to 260	5.0	- 7 threads, otherwise barren
260	to 265	5.0	- 7 threads, " "
265	to 270	5.0	- 5 threads, " "
270	to 275	5.0	- 6" patch of disseminated sulphides, 3 threads and 2 only 1/4" seams, Qtz, sulphides
275	to 285	10.0	- 6 only 1/8" seams, sulphides
285	to 290	5.0	- 2 threads
290	to 295	5.0	- threads parallel to C/A (290 to 291), 1/8" seam sulphides at 291 @ 35° to C/A, 5 threads
295	to 300	5.0	- 3 threads at 35 to 40° C/A and at 295.5' at 45° - 1 1/2" of siliceous alteration with blebs of pyrite and chalco — No 80 - 5.0 @ 0.20% Cu
300	to 305	5.0	- 8 threads
305	to 310	5.0	- 5 threads and at 309' a 3/8" Qtz Stringer @ 40° C/A
310	to 315	5.0	- 9 threads
315	to 320	5.0	- barren but at 319' a 3/4" Qtz Carb seam with pyrite + chalco @ 40° C/A
320	to 325	5.0	- 2 threads
325	to 330	5.0	- one Qtz seam 1/8"
330	to 335	5.0	- 7 threads
335	to 340	5.0	- 336 to 337 a Qtz filled 3/4" fracture seam, pyrite, chalco, some fine sulphides and threads in balance - 337 to 339.8 Quartz + Chlorite porphyry

JOGRAN MINES LTD

D.D. HOLE No 7.

FROM	TO	FOOTAGE	Description
340	to 345	5.0	- 6 threads and at 344' Qtz seam 3/8" @ 45° C/A
345	to 350	5.0	- 14 threads and two 1/4" Qtz seams - 70° @ 345' and 45° @ 349'
350	to 355	5.0	- 8 threads and 1/2" Qtz seam @ 70° at 352.5' and 1" Qtz Carb. @ 90° at 353.5'
355	to 360	5.0	- 15 threads, FeO stain & sulphides - at 357' a 2" alteration @ 70°, sulphides
360	to 365	5.0	- 22 threads
365	to 370	5.0	- 12 threads
370	to 375	5.0	- One 1/8" Qtz seam @ 40° C/A
375	to 380	5.0	- 3 FeO + $CaCO_3$ seams
380	to 385	5.0	- 2 " " "
385	to 390	5.0	- 2 " " " @ 20 to 25° C/A
390	to 395	5.0	- One 3/8" Qtz Stk @ 25° C/A at 392.5' and one 1/4" at 394 @ 70°
395	to 400	5.0	- 1" well mineralized stringer 40° C/A at 398', - 5 threads and at 398.3 an 1" Qtz Carbonate and Carbonate fault @ 45° C/A
400	564	164.0	- Looks like Siliceous Volcanic
400	to 404.5	4.5	- barren, some alteration paralleling core axis, at 404.5' a 3/8" $CaCO_3$ seam at 45° C/A
404.5	to 408.	3.5	- Pyrite and molybdenum indications - Alteration and 1/2" Qtz seam, chalco and pyrite 40° C/A at 406.5', also 3/8" Qtz Stk at 407.5' →
408	to 416	8.0	- Fractured and alteration, no mineralization → No 81 - 3.5 @ 0.19 % Cu → No 132 - 8.0 @ 0.11 % Cu.
416	to 419	3.0	- 5/8" of massive sulphide @ 80° C/A also 3/8" Qtz Carbonate seam at 419' at angle 15° C/A.
419	to 423.3	4.3	- Two 1/8" Qtz seams @ 15 to 20° C/A
423.3	to 428.3	5.0	- At 423.9 a 1/2" seam of sulphide @ 45° C/A also 1/4" seam at 40° (opposite angle) - At 428' a 3/8" altered seam of sulphide
428.3	to 430	1.7	- Barren
430	to 433	3.0	- At 430.3 seam and breccia 1/2" with sulphide - At 432 to 432.8 heavy disseminated sulphides and a 1/2" Qtz seam at 50° C/A
433	to 440	7.0	- Mostly barren
440	to 447	7.0	- " "
447	to 449	2.0	- At 447 a 1/2" Qtz Bert. fault seam @ 50° and fine disseminated sulphides in fracturing
447	to 450	1.0	- Broken Core - Hole stopped at 450 feet See Page 4 for subsequent deepening.

No 82 - 3.0 @ 0.75 % Cu.

JOGRAN MINES LIMITED

PROSPECTUS FOR FILING AND AS FILED WITH THE ONTARIO SECURITIES COMMISSION PURSUANT TO THE SECURITIES ACT (ONTARIO)

1. JOGRAN MINES LIMITED (hereinafter referred to as "the Company") was incorporated under the laws of the Province of Ontario by letters patent dated the 20th day of May, 1964. The head office of the Company is located at the Fifth Floor, 244 Bay Street, Toronto 1, Ontario.

2. The names, occupations and addresses of the officers and directors and promoter of the Company are as follows:

(a) Officers and Directors:

President and a Director	ALEXANDER STEEL, 972 Eglinton Avenue East, Toronto, Ontario. Executive.
Vice-President and a Director	RAYMOND WILLIAM HUNSTONE, 3336 Radcliffe Avenue, West Vancouver, B.C., Contractor.
Secretary-Treasurer and a Director	WILLIAM LONGMUIR HENDERSON, 19 Wincrest Drive, Scarborough, Ontario. Accountant.
Director	JOHN EDWARD ROGERS WOOD, 1551 Angus Drive, Vancouver, B.C. Mining Engineer.
Director	ORSON GUTHRIE, 131 Burnhamthorpe Road, Islington, Ontario. Executive.

(b) Promoter:

McKinney Gold Mines Limited (Non-Personal Liability), a public company, listed on the Canadian and Vancouver Stock Exchanges, might be considered the promoter of the Company as it caused its incorporation and is the vendor of the mining claims referred to in paragraph 10 hereof.

3. Messrs. Fairley, Welsh & Co., 1815 Yonge Street, Toronto, Ontario, are the auditors for the Company.

ONTARIO SECURITIES COMMISSION 1964

4. Guaranty Trust Company of Canada, 366 Bay Street, Toronto, Ontario, is the stock registrar and transfer agent of the Company.

5. The authorized capital of the Company consists of 3,000,000 shares of the par value of $1.00 each, all of one class, namely, common, of which 1,020,005 shares, fully paid and non-assessable have been allotted and issued to date.

6. The Company has issued no bonds or debentures nor does it presently propose to issue any.

7. Of a total of 750,000 shares of the Company issued for properties as referred to in paragraph 10 hereof (hereinafter referred to as "vendor shares") certificates representing 675,001 of such shares are presently held in escrow with Guaranty Trust Company of Canada, 366 Bay Street, Toronto, Ontario, subject to pro rata release amongst the persons entitled thereto only upon the written consent of the Ontario Securities Commission and the Company. Any dealings with such shares within the escrow require the written consent of the Ontario Securities Commission. The 74,999 vendor shares presently free from escrow and held as set out in item 10 hereof may be pledged or sold at the current offering price for shares of the Company but the proceeds from the sale of such shares will not go into the treasury of the Company.

8. As of the date of this prospectus five shares of the Company (incorporators' shares) have been sold for $1.00 each and 270,000 shares were issued to McKinney Gold Mines Limited (Non-Personal Liability) in settlement of $27,000 advanced to the Company to defray exploration work, engineering fees and diamond drilling on the claims referred to in paragraph 10 hereof. No commissions were paid or are payable in connection with the above mentioned shares. Before all or any part of the 270,000 shares are sold or offered for sale, an amendment to the prospectus will be filed.

9. No securities of the Company other than those above set out have been sold or issued as of the date of this prospectus.

10. By an agreement dated the 25th day of May, 1964, made between McKinney Gold Mines Limited (Non-Personal Liability) of the first part (hereinafter referred to as "McKinney") and the Company of the second part, the Company acquired the following unpatented mining claims situated in Ryan Township, Sault Ste. Marie Mining Division, Province of Ontario, described as follows:-

SSM 66421 to SSM 66430 inclusive
SSM 62886
SSM 62888 to SSM 62891 inclusive
SSM 64225
SSM 62917 and SSM 62918
SSM 65883 and SSM 65884
SSM 59846

(hereinafter referred to as the "Mining Claims"), for and in consideration of 750,000 fully paid and non-assessable shares of the capital stock of the Company, of which 10% were free shares and the balance were placed in escrow with the stock registrar and transfer agent of the Company, subject to the terms of escrow set forth in paragraph 7 hereof, and the following royalties -

(a) a royalty of 6-2/3 cents per ton for each and every ton of ore taken from Mining Claims SSM 62886, SSM 62888 to SSM 62891 inclusive and SSM 64225;

(b) a royalty of 10 cents per ton for each and every ton of ore taken from Mining Claims SSM 59846, SSM 62917, SSM 62918, SSM 65883 and SSM 65884;

(c) a royalty of 10 cents per ton for each and every ton of ore taken from Mining Claims SSM 66421 to SSM 66430, inclusive.

The only persons who have received or are entitled to receive an interest in the said 750,000 vendor shares are as follows:

		Free Shares	Escrowed Shares
Clifford Bridge, P.O. Box 96, Sault Ste. Marie, Ontario	-	11,250	101,250
William John Richards, 15 Lansdowne Avenue, Sault Ste. Marie, Ontario, and John Haugeneder, 718 Wellington St. East, Sault Ste. Marie, Ontario, jointly	-	12,500	112,503
Herman O. Kell 253 Wellington St. East, Sault Ste. Marie, Ontario	-	6,041	54,369
The Vendor	-	45,208	406,879

The only persons who are entitled to receive an interest in the said royalties are as above set forth.

11. The mining claims referred to in paragraph 10 hereof are located in the north-east quarter of Ryan Township, Sault Ste. Marie Mining Division, Province of Ontario.

For further particulars of the location and accessibility of the mining claims and the work done on same, including the setting up of a drill camp, the building of a bridge, the carrying out of a geophysical survey by magnetometer and electromagnetic methods and the completion of a diamond drilling program of 5,437 feet; the general geology and structure of the mining claims, particulars of the assessment work done on the claims and their present status; the recommendations of the Company's Engineer and the estimate of the costs of the recommended diamond drilling program, reference is made to the Report of Allen W. Jeckell, B.A.,Sc., P.Eng., dated the 15th day of October, 1964, which Report accompanies and forms part of this prospectus.

There is no plant or equipment on the mining claims. Particulars of the work done on the mining claims by the Company are set out in the said Report.

12. So far as the signatories hereto are aware, no shares or cash consideration have been issued or paid or are proposed to be issued or paid to any promoter other than the vendor shares referred to in paragraph 7 hereof and the 270,000 shares referred to in paragraph 8 hereof.

13. By an agreement dated the 30th day of September, 1964, made between the Company and W.D. Latimer Co. Limited (hereinafter referred to as the "Underwriter-Optionee"), the Underwriter-Optionee, acting on behalf of clients, agreed to purchase 200,000 fully paid shares of the Company at 10 cents per share, payable within two days from the date such shares are qualified for sale in the Province of Ontario (which date is hereinafter referred

to as the "effective date") and in consideration therefor the Company granted to the Underwriter-Optionee, acting on behalf of clients, the exclusive right or option to purchase all or any part of an additional 800,000 shares as follows:

No. of shares	Price per share	Time within which option must be exercised.
200,000	10 cents	3 mos. from effective date
200,000	12½ cents	6 mos. from effective date
200,000	15 cents	9 mos. from effective date
200,000	17½ cents	12 mos. from effective date

The agreement provides that if default occurs in making any of the option payments as therein due and such default is not waived by the Company or the option dates not extended by mutual consent then in each of said cases the option, insofar as same is not exercised, will terminate upon the Company giving 10 days' written notice of termination to the Underwriter-Optionee. The parties to the said agreement understand that in the event of default or waiver thereof or extension of any option, an amendment to this prospectus must be filed with the Ontario Securities Commission within 20 days thereof if the shares of the Company are then in primary distribution.

W. D. Latimer Co. Limited in entering into the said agreement was acting on behalf of Richfield Securities Limited, 244 Bay Street, Toronto, Ontario, as to a 50% interest, Northwood Mining Limited, Suite 506, 540 Burrard Street, Vancouver, B.C., as to a 25% interest, and McKinney Gold Mines Limited (Non-Personal Liability), Suite 506, 540 Burrard Street, Vancouver, B.C., as to a 25% interest.

The only persons owning a greater than 5% interest in Richfield Securities Limited are as follows:- Beatrice Latimer, Jane Latimer and Anne Latimer, all of 29 Edgehill Road, Islington, Ontario, and Audrey MacGregor of 128 Glen Manor Drive, Toronto, Ontario.

The only person owning a greater than 5% interest in Northwood Mining Limited is as follows:- John Edward Rogers Wood, 1551 Angus Drive, Vancouver, B.C.

McKinney Gold Mines Limited (Non-Personal Liability) being a public Company whose shares are widely distributed, the signatories hereto are unaware as to what persons hold a greater than 5% interest therein.

There are no sub-underwritings or sub-options outstanding or proposed to be made. In the event that at any time a sub-underwriting or sub-option is given the parties hereto understand that an appropriate amendment to this prospectus must be filed by the Company within the required statutory period if the shares of the Company are in the course of primary distribution.

14. The preliminary and organizational expenses in an administrative sense, including legal and audit fees, corporation costs, costs of filing and printing of this prospectus and other related items are estimated at $4,500.00. None of these expenses have been paid to date but are to be paid out of monies to be received by the Company from the Underwriter-Optionee as disclosed in paragraph 13 hereof. Future administrative and minimum development expenses (in addition to the development expenses already incurred and paid for) for the current year are estimated at $3,000.00 and $25,000.00 respectively.

15. The monies the Company receives from the underwritten shares and such monies as it receives from optioned shares as are sold will be used to defray the expenses of the incorporation and organization of the Company and its ordinary operating expenses and in carrying out the recommendations of the Company's engineer as set out in the report accompanying this prospectus insofar as there are funds available. If at any time in the future the

Company decides to spend any of the proceeds from the underwritten or optioned shares other than as set out herein, the signatories hereto understand that an amendment to this prospectus should be filed.

16. No indebtedness is to be created or assumed by the Company save and except the payment of the royalties referred to in paragraph 10 hereof and except for legal fees, printing costs of the prospectus and ordinary operating expenses of the Company which are not shown in the balance sheet of the Company reported upon by Messrs. Fairley, Welsh & Co., 1815 Yonge Street, Toronto, Ontario, as of the 30th day of September, 1964, which balance sheet accompanies and forms part of this prospectus.

17. The particulars as regards the business in which each director and officer has been engaged during the past three years are as follows:

Alexander Steel	President and a Director - has been Vice-President of Borden Co. Limited, 1275 Lawrence Avenue East, Toronto, Ontario, for more than 3 years.
Raymond W. Hunstone	Vice-President and a Director - has been President of Hunstone Contracting Co. Ltd., 626 West Pender Street, Vancouver, B.C., for more than 3 years.
William L. Henderson	Secretary-Treasurer and a Director - has been Accountant with W.D. Latimer Limited and then with W.D. Latimer Co. Limited, 244 Bay Street, Toronto, Ontario, for the past 2 years and previously with E.T. Lynch & Company, 55 Yonge Street, Toronto, Ontario.
John E.R. Wood	Director - has been President of Northwood Construction Company Limited, Suite 506, 540 Burrard St., Vancouver, B.C. and its American associate, Northwood, Inc. for more than 3 years.
Orson Guthrie	Director - has been Sales Manager of Nabisco Limited, 55 Eglinton Avenue East, Toronto, Ontario, for more than 3 years.

18. No director of the Company now has or ever had any interest directly or indirectly in the properties acquired by the Company, save that Messrs. Alexander Steel, Raymond W. Hunstone, William L. Henderson, J. E. R. Wood and Orson Guthrie, the directors of this Company, are also directors of McKinney Gold Mines Limited (Non-Personal Liability), the vendor of the said mining claims.

19. No director or officer has been paid or is proposed to be paid a salary as such. Each director will receive a fee of $25.00 for each meeting of the board of directors which he attends.

20. No dividends have been paid to date.

21. McKinney Gold Mines Limited (Non-Personal Liability), by reason of beneficial ownership of vendor shares of the Company, is in a position to elect or cause to be elected a majority of directors of the Company.

22. The 75,000 free vendor shares, being 10% of those shares listed in Item 10 hereof, may be sold or offered for sale but the proceeds will not accrue to the benefit of the treasury of the Company. Other than as shown above, the signatories hereto are not aware of any present or proposed arrangement whereby vendor shares of the Company were sold or given or will be sold or given to any person or persons as a bonus or otherwise. If any such arrangement is made and comes to the knowledge of the signatories hereto, an appropriate amendment to this prospectus will be filed within twenty days thereof if the securities of the Company are then in the course of primary distribution.

23. There are no other material facts in relation to the securities of the Company which require disclosure other than those above set forth.

DATED this 9th day of November, 1964.

WE, the undersigned directors and promoter hereby certify that the foregoing constitutes full, true and plain disclosure of

all material facts in respect of the offering of securities referred to above as required under Section 38 of The Securities Act (Ontario) and there is no further material information applicable other than under the financial statements or reports where required.

AUDITORS' REPORT

To the Directors
Jogran Mines Limited

We have examined the accompanying balance sheet of Jogran Mines Limited as at September 30, 1964 and the related statement of deferred exploration, development and administration expenses for the period from the date of incorporation, May 20, 1964 to September 30, 1964 and have obtained all the information and explanations we have required. Our examination included a general review of the accounting procedures and such tests of accounting records and other supporting evidence as we considered necessary in the circumstances.

In our opinion, the accompanying balance sheet and the related statement of deferred exploration, development and administration expenses present fairly the financial position of the company as at September 30, 1964 and the results of its operations for the period ended on that date, in accordance with generally accepted accounting principles.

NOTES TO FINANCIAL STATEMENTS

SEPTEMBER 30, 1964

(1) UNDERWRITING AND OPTION AGREEMENT

Under the terms of an agreement dated September 30, 1964, the company has agreed to sell 200,000 shares of its capital stock at 10¢ per share for a total of $20,000.00 payable within 48 hours of the date of acceptance for filing of the company's prospectus by the Ontario Securities Commission, referred to as the "effective date."

By the same agreement, the company has granted options to purchase a further 800,000 shares as follows:

200,000 shares at	10¢	within 3 months of the effective date
200,000 shares at	12½¢	within 6 months of the effective date
200,000 shares at	15¢	within 9 months of the effective date
200,000 shares at	17½¢	within 12 months of the effective date

(2) ROYALTY OBLIGATIONS

As part consideration for the purchase of 21 mining claims in Ryan Township, Sault Ste. Marie Mining Division, the company assumed royalty obligations whereby in the event that a mill is erected to treat ore from the mining claims, royalties are payable in the amount of 6 2/3¢ per ton in respect of 6 claims and 10¢ per ton in respect of the other 15 claims.

(3) REPAYMENT OF ADVANCES

The company and McKinney Gold Mines have agreed that the latter accept 270,000 shares of the company in settlement of $27,000.00 of the advances by McKinney Gold Mines. These shares were issued on November 3, 1964.

PREAMBLE

Subsequent to my General Report of November 8th, 1963, which was used to qualify an underwriting of McKinney Gold Mines Ltd. shares, a geophysical survey by Magnetometer and Electromagnetic methods was completed on the greater part of eleven (11) eastern claims. (See Table above for claim numbers). Final maps and reports were received late January, 1964.

Based on the findings of this Geophysical Report and other data contained in my November 8th, 1963 Report, a preliminary Diamond Drilling Program, for a minimum 2500 footage to be expended in six (6) holes, was recommended in my Report of February 27th, 1964.

A contract covering this drilling and dated May 6th, 1964 was signed with Continental Diamond Drilling Company Limited of Rouyn, Quebec on or about May 11th, 1964.

A drill camp was located on Claim SSM-66421 at the shore of the north-west bay of Mamainse (Smith) Lake. Service to this camp was via the Carp River Road (Mileage 43 on Highway 17 North from Sault Ste. Marie) for a distance of some 8 miles by jeep and truck to the north end of Mamainse Mountain. At this point a bridge was built by Continental to cross the Carp River and a drill-tractor trail was cut for 1½ miles to the drill camp.

Flying service can also be used from Sault Ste. Marie, a distance of 38 miles to Mamainse Lake.

The first hole was started on May 24th, 1964.

On or before this date, McKinney Gold Mines Ltd., (Ontario Mining Licence A-37025) transferred title to all of the mining claims mentioned herein to JOGRAN MINES LTD. (Ontario Mining Licence A-37315).

The diamond drilling program was suspended August 21st, 1964.

DEVELOPMENT BY DIAMOND DRILLING - Preliminary Contract.

Five (5) of the preliminary diamond drill holes, namely, Nos. 1, 3, 4, 5 and 6, were completed by June 26th for a total footage of 2335 feet.

The site location for No. 2 Hole proved unsatisfactory for a suitable drill "set-up" and has not, to the date of this report, been drilled.

These preliminary holes were sited to test individual and/or multiple electromagnetometer cross-overs (anomalous zones). Nos. 1 and 3 Holes collared 250 feet apart, and on Line 200 East, were drilled to test two anomalous cross-overs, Nos. 4, 5 and 6 Holes were drilled to test similar cross-overs on Lines 1000 West, 1200 West and 1400 West, respectively. Each of these three cross-overs were individual anomalous zones and, as such, had no connection one with the other, nor with Nos. 1 and 3 Holes.

The sulphide mineralization intersected in Diamond Drill Holes 4, 5 and 6 returned indications of copper thus:-

NO. 4 HOLE - Line 1000 West - 1800 feet north.

210.5 to 211.5 - 1 Foot @ 1.02% Copper.

214 to 225 - 11 Feet @ 0.10% Copper.

NO. 5 HOLE - Line 1200 West - 1300 feet north.

235 to 235.5 - 0.5 Feet - 6" fault seam @ 30 to 35 Degrees C/A

235.5 to 238.5 - 3.0 Feet @ 0.12% Copper.

305 to 310 - 5 Feet @ 0.11% Copper.

310 to 315 - 5 Feet @ 0.10% Copper.

315 to 320 - 5 Feet @ 0.11% Copper.

NO. 6 HOLE - Line 1330 West - 650 feet north.

172.7 to 173.9 - 1.2 Feet @ 0.21% Copper.

181.6 to 188.2 - 6.6 Feet @ 0.14% Copper.

280.9 to 292.2 - 11.3 Feet @ 0.06% Copper.

Extensive sulphide mineralization was intersected in Holes Nos. 1 and 3.

HOLE NO. 1 - Line 200 East - 1250 feet north.

- Drilled S 27 W at 45 Degrees.

Indications of chalcopyrite in seams and fractures were evident throughout the total length of 560 feet. However, none of this mineralization returned economic copper content.

Twenty-nine (29) samples were taken for a total length of 192 feet of core. (Length of Hole - 560 feet).

The sections and average assays were:-

130 to 216 - 86 Feet @ 0.15% Copper.
High Assay - 0.36% over 2 feet.
Low Assay - 0.11% over 11 feet.

250.5 to 258.5 - 8 Feet @ 0.03% Copper

277 to 354 - 77 Feet @ 0.09% Copper, in Quartz Felsite Porphyry.
High Assay - 0.14% over 5 feet.
Low Assay - 0.05% over 5 feet.

354 to 375 - 21 Feet @ 0.10% Copper.

HOLE NO. 3 - Line 200 East - 1500 feet north.

- This hole was drilled at 45° on the same line and section, north of, behind and below No. 1 Hole.

Thirty-four (34) samples were taken for a total length of 270 feet. (Length of Hole - 498 feet)

The sections and average assays were:-

100 to 225 - 125 Feet @ 0.092% Copper
High Assay - 0.18% over 10 feet.
Low Assay - 0.05% over 10 feet.

249 to 253 - 4 Feet @ 0.58% Copper

274 to 362 - 88 Feet @ 0.12% Copper
High Assay - 0.21% over 10 feet.
Low Assay - 0.04% over 6 feet.

362 to 379.5 - 17.5 Feet @ 1.73% Copper.
High Assay - 3.12% over 5 feet.
Low Assay - 0.40% over 2.3 feet.
(SEE DETAIL SECTION BELOW)

379.5 to 415 - 35.5 Feet @ 0.20% Copper.
High Assay - 1.04% over 6 inches.
Low Assay - 0.12% over 9 feet.

NOTE - The continuous section, from 274 to 415 feet or 141 feet, averaged 0.342% Copper.

The DETAILED SAMPLING and individual assay of the Section 362 to 379.5 feet or 17.5 feet of core follows:-

362 to 363.5 - 6" of well disseminated sulphides and 1 foot of fine disseminated - also ½" seam, iron stained and carbonate filled, some molybdenite.
- SAMPLE NO. 1 - for 1.5 Feet @ 0.54% Copper.

363.5 to 366.2 - Highly fractured, Quartz filled with 3% sulphides, pyrite and chalcopyrite.
- SAMPLE NO. 2 - for 2.7 Feet @ 2.50% Copper.

366.2 to 366.4 - 2" Fault seam, iron stain and carbonate filled at 30 Degrees to core-axis, no mineral.
- NO SAMPLE - for 0.2 Feet @ nil.

366.4 to 368 - Highly fractured Quartz diabase, 5% sulphides in dissemination and threads.
- SAMPLE NO. 3 - for 1.6 Feet @ 2.24% Copper.

368 to 373 - Highly fractured, 5 to 7½% sulphides, pyrite, chalcopyrite, iron stain and some rose Quartz.
- SAMPLE NO. 4 - for 5.0 Feet @ 3.12% Copper.

373 to 375.3 - Fractured Quartz diabase, minor threads and seams, pyrite and chalcopyrite.
- SAMPLE NO. 5 - for 2.3 Feet @ 0.40% Copper.

375.3 to 379.5 - Fractured reddish brown Quartz, minor pyrite, and chalcopyrite threads in all directions.
- SAMPLE NO. 6 - for 4.2 Feet @ 0.61% Copper.

NOTE - Sample No. 2 assayed Gold 0.01 ounce and Silver 0.17 ounce.
Sample No. 4 " " 0.02 " and " 0.34 ounce.

DEVELOPMENT BY DIAMOND DRILLING - Additional Contract.

With immediate and required assessment work completed, the next 2651 feet of diamond drilling was distributed to Holes Nos. 7, 8, 9, 10, 11 and so directed as to define and extend the intersection, given above in detail, of No. 3 Hole.

The following table lists, by date, the sequence in which the various holes were drilled:-

Preliminary Holes

Date - 1964 From	-- To	Hole No.	Feet	Cumulative Footage
May 24	- May 29	1	560	560
June 1	- June 7	3	498	1058
June 8	- June 14	5	390	1448
June 16	- June 18	6	400	1848
June 20	- June 21	4A	84	1932
June 23	- June 26	4	403	2335

Additional Contract

Date - 1964 From	-- To	Hole No.	Feet	Cumulative Footage
June 27	- July 2	7	450	2785
July 4	- July 9	8	499	3284
July 10	- July 13	9	500	3784
July 16	- July 18	7	200 (deepen)	3984
July 20	- July 24	10	503	4487
July 26	- July 31	11	498	4986

Assessment Hole

Aug. 1	- Aug. 6	"A"	398	5384
Aug. 21	- Aug. 21	"A"	53	5437

HOLE NO. 7 - Line 200 East - 1410 feet north.
- This hole was drilled at 45° on same line and section at one-half way between Nos. 1 and 3 Holes.

Forty-one (41) samples were taken for a total length of 232 feet. (Length of Hole - 650 feet)

NOTE - This hole was originally drilled to 450 feet. Sample No. 85 for 447 to 449 feet or 2.0 feet assayed 2.22% Copper. (See Detail Section below, - 416 to 464 feet.) and was later deepened to 650 feet.

There was evidence of chalcopyrite mineralization in 74% of the core (480 feet) with the barren sections amounting to 118 feet of scattered volcanics, 40 feet of Quartz Felsite Porphyry and 12 feet in one fault. Some 48.3% of the mineralized core was sampled and assayed.

The sections and average assays were:-

104.5 to 125 - 20.5 Feet @ 0.18% Copper.
High Assay - 0.27% over 5 feet.
Low Assay - 0.08% over 5 feet.

167.5 to 170 - 2.5 Feet @ 0.41% Copper.

181.0 to 192.5 - 11.5 Feet @ 0.10% Copper.

295 to 300 - 5.0 Feet @ 0.20% Copper.

404.5 to 416 - 11.5 Feet @ 0.114% Copper.

416 to 464 - 48 Feet @ 0.50% Copper.

- In Detail:-

416.0 to 419.0 --	3.0 Feet @ 0.75%	
419.0 to 423.3 --	4.3 " @ 0.11%	
423.3 to 428.3 --	5.0 " @ 0.18%	
428.3 to 430.0 --	1.7 " @ 0.07%	- Low Assay.
430.0 to 433.0 --	3.0 " @ 1.62%	
433.0 to 440.0 --	7.0 " @ 0.06%	
440.0 to 447.0 --	7.0 " @ 0.11%	
447.0 to 449.0 --	2.0 " @ 2.22%	- High Assay.
449.0 to 455.0 --	6.0 " @ 0.22%	
455.0 to 459.0 --	4.0 " @ 0.42%	
459.0 to 464.0 --	5.0 " @ 1.37%	

464 to 536.5 - 72.5 Feet @ 0.132% Copper.
High Assay - 0.51% over 5 feet.
Low Assay - 0.01% over 8 feet.

536.5 to 548.5 - 12 Feet - FAULT.

564 to 604 - Quartz Felsite Porphyry.

604 to 642 - 38 Feet @ 0.324% Copper.

- In Detail:-

604 to 610 --	6 Feet @ 0.32%
610 to 615 --	5 " @ 0.25%
615 to 620 --	5 " @ 0.35%
620 to 624 --	4 " @ 0.36%
624 to 627 --	3 " @ 0.46%
627 to 635 --	8 " @ 0.16%
635 to 642 --	7 " @ 0.47%

NOTE - At 648 feet a SPECIMEN, showing Quartz Stringers containing cluster chalcopyrite and bornite, is held for inspection.

HOLE NO. 8 - Line 100 East - 1500 feet north.

- Drilled S 27 W at 45 Degrees, this hole is parallel to and 100 feet west of No. 3 Hole.

Forty-four (44) samples were taken for a total length of 307 feet. (Length of Hole - 499 feet)

The sections and average assays were:-

10 to 18.5 -- 8.5 Feet @ 0.11% Copper.

18.5 to 50.0 -- 31.5 Feet @ 0.435% Copper.

OR

18.5 to 28.5 -- 10.0 Feet @ 0.983% Copper.

- In Detail:-

18.5 to 23.0 --	4.5 Feet @ 1.45%
23.0 to 27.0 --	4.0 Feet @ 0.56%
27.0 to 28.5 --	1.5 Feet @ 0.71%

50.0 to 104.5 - 54.5 Feet @ 0.09% Copper.

116.0 to 135.0 - 19.0 Feet @ 0.13% Copper

151 to 160 - 9.0 Feet @ 0.09% Copper

168 to 169 - 1.0 Feet @ 0.32% Copper

289 to 418 - 129.0 Feet @ 0.132% Copper.
High Assay - 0.90% over 5 feet.
Low Assay - 0.02% over 10 feet.

418 to 444.5 - 26.5 of FAULT.

444.5 to 475.0 - 30.5 Feet @ 0.264% Copper.

- In Detail:-

- 444.5 to 456.5 -- 12.0 Feet @ 0.13%
456.5 to 463.0 -- 6.5 Feet @ 0.27%
463.0 to 467.0 -- 4.0 Feet @ 0.52%
467.0 to 472.5 -- 5.5 Feet @ 0.19%
472.5 to 475.0 -- 2.5 Feet @ 0.65%

475 to 499 - 24.0 Feet @ 0.127% Copper.

HOLE NO. 9 - Line 200 East - 1650 feet north.

- Drilled S 27 W at 45 Degrees. This hole was collared 155 feet north of No. 3 Hole to drill behind and underneath No. 3 and in the same section as Holes No. 7 and No. 1 which are south of Hole No. 3.

Twenty-four (24) samples were taken for a total length of 142.6 feet. (Length of Hole - 500 feet)

The sections and average assays were:-

90.5 to 124.5 - 34.0 Feet @ 0.222% Copper.
High Assay - 0.99% over 1.5 feet.
Low Assay - 0.05% over 4.5 feet.

124.5 to 125.3 -10 inch FAULT.

137.0 to 143.6 - 6.6 Feet @ 0.09% Copper.

267.0 to 340.0 - 73 Feet @ 0.135% Copper.
High Assay - 0.48% over 4.5 feet.
Low Assay - 0.04% over 10 feet.

340.0 to 360.0 - 20 Feet @ 0.055% Copper.

451.0 to 458.0 - 7 Feet @ 0.215% Copper.

477.0 to 479.0 - 2 Feet @ 0.20% Copper.

HOLE NO. 10 - Line 100 East - 1650 feet north.

- Drilled S 27 W at 45 Degrees. This hole was collared 150 feet north of No. 8 Hole and is parallel to and 100 feet west of No. 9 Hole.

Fourteen (14) samples were taken for a total length of 89 feet. (Length of Hole - 503 feet)

The sections and average assays were:-

28 to 29.5 - 1.5 Feet @ 0.84% Copper.

97.0 to 102.5 - 5.5 Feet @ 0.25% Copper.

228.0 to 236.0 - 8 Feet @ 0.40% Copper.

266.0 to 286.0 - 20 Feet @ 0.125% Copper.

449.0 to 482.0 - 33 Feet @ 0.22% Copper.
High Assay - 0.80% over 1 foot.
Low Assay - 0.08% over 5 feet.

482 to 503 - 21 Feet @ 0.114% Copper.

HOLE NO. 11 - Line 200 West - 1940 feet north.

- Drilled S 27 W at 45 Degrees.

- This hole was collared some 400 feet true north and 100 feet true west of the collar of No. 10 Hole to intersect an anomalous cross-over on line 200 West at 1740 feet north.

At this stage in the drilling program, it was becoming evident that the major structural control of brecciation, certain faulting with attendant chalcopyrite mineralization, might lie in a N 17 W direction with a possible steep dip to the south-west.

On the basis of this assumption and in keeping with the program of testing the multiple E-M cross-overs, two holes, Nos. 11 and 12, were spotted.

Structure in No. 11 Hole was similar to that intersected in Nos. 1, 3, 7, 8, 9 and 10. However, the degree of chalcopyrite mineralization was not as strong, although the incidence of mineralization throughout the range of the hole was greater than the sampling as listed.

The sampling and average assays were:-

31.5 to 33.0 - 1.5 Feet @ 0.81% Copper.

82.0 to 104.0 - 22.0 Feet @ 0.085% Copper.

173.0 to 181.0 - 8.0 Feet @ 0.20% Copper.

200 to 237.8 - 37.8 Feet @ 0.138% Copper.
High Assay - 1.75% over 0.8 foot.
Low Assay - 0.11% over 12 feet.

408 to 409 - 1.0 Foot @ 1.00% Copper

ASSESSMENT HOLE NO. "A" - Line 200 West - 1150 feet south.

- Drilled N 27 E at 45 Degrees.
(Length of Hole - 451 feet)

- This hole was drilled to supplement assessment work for one of two contiguous groups of Claims and in order to test the strongest area of a Self-Potential Geophysical Survey which had been undertaken under vendor auspices. The locale was also the site of a smaller Low-High-Low Magnetic anomalous area, with a weak electro-magnetic anomalous cross-over some 200 feet to the east.

There was scattered sulphide mineralization noted in the core. A fault zone from 327 to 340 feet was intersected. None of the mineralization required sampling.

Special specimens at 377 to 378 feet of 1" Quartz Stringers containing chalcopyrite were held for visual inspection.

GEOLOGY AND STRUCTURE - Local.

Rock classification is within a narrow range.

The greater proportion of the mass intersected by the drill holes has been identified as Quartz diabase which, by granular texture, grades into a phase that could be considered a gabbroic diabase. Lesser sections of core appear to have the appearance of volcanic lavas, but it is difficult to establish exact contacts. It is, however, noted that the siliceous content of the various rock formations changes in a marked degree at a point of carbonate filled fault markers, viz., a sudden cut-off of a granular diabase to a phase of volcanic lava or fine grained Quartz diabase. At this date, it is considered that the volcanics have a general E-W strike and a flat dip to the north.

A single intrusive rock type has been noted and classified as a Quartz Felsite Porphyry. It is fine grained and uniform throughout to either contact with no alteration to the contacted rock formation. This porphyritic formation is considered to occur as steep dipping dikes along a general N-S strike.

Copper sulphide mineralization does not appear to be confined or controlled by any particular rock formation as it is found in varying degree in all classifications.

Such mineralization is associated with a Quartz or siliceous phase of intrusion which has followed and filled channels originally opened by N-S faulting which shattered adjacent formations.

The resultant channels comprise Quartz filled brecciated faults, stringers from ½ inch up, seams at ¼ inch and numerous cracks which, in the Drill Logs, are noted as "threads". It is also noted that certain "granitization" or siliceous alteration generally carries appreciable copper values, particularly in the vicinity of Quartz filled brecciated faults.

There is a paucity of pyrite throughout the shattered and mineralized zones and therefore such zones cannot be classified as replacement type deposits.

Later major faulting, typified by barren carbonate filled breccia, has offset such mineralized shatter zones and also the porphyritic dikes. The attitude of such later faulting is still unknown but, by intersection in three holes, might be flat lying (near horizontal).

Accordingly, the sense without proof or argument is that the attitude and degree of copper sulphide mineralization is controlled by early N-S faulting in a vertical plane, all of which has been offset by later flat lying major faulting.

GEOLOGY - ECONOMIC - Local.

A perusal of the samplings and assays as given herein (Holes Nos. 1, 3, 7, 8, 9, 10 and 11) shows that no economic copper ore has been found in this preliminary drilling.

However, certain sections of core have returned appreciable values and/or impressive lengths of consistent copper content. It will be noted that such sections have been reported "In Detail".

At the same time, it should be appreciated that the drill hole sections (some 300 feet on line by 400 feet at 45 Degrees on one section and 100 feet on line by 400 feet at 45 Degrees on a second section which is 100 feet distant) have tested a relatively small proportion of the overall dimension of the anomalous formation or mass. Such anomalous formation is considered to have a length of 2400 feet and potential maximum width of 800 feet.

The degree of mineralization, hence grade of copper, is in proportion to the degree of brecciation and shattering. The preliminary drilling was directed to test anomalous conditions and determine whether sulphides and of what type were the causation of such anomalies. As this has now been determined, it should follow that testing should continue in order to locate and define the zonal areas that carry the maximum brecciation and shattering.

The magnetometer survey and E-M anomalous "cross-overs" suggest a potential fractured and mineralized zonal trend along a N 18 W axis, namely, the 2400 feet mentioned above.

GEOLOGY AND STRUCTURE - General

Certain current diamond drilling on property held by McKinney Gold Mines Ltd., notably on Claim SSM-67726, Kincaid Township and some 1¼ miles distant in a N 30 W direction from the location of Jogran Mines drilling, is testing a mineralized formation, viz., a fault zone having a similar N W strike trend.

This fault zone trend is also noticeable as crossing the intervening acreage on strike between the two drilling sites. This intervening or middle acreage is the locale of iron formation which, according to air-borne magnetometer survey, shows a "break" or separation in magnetic intensity which coincides with the above-mentioned fault trend. The eastern portion of the iron formation is displaced southerly in relation to the western portion.

A perusal of Aeromagnetic Map 2188G - Mica Bay Sheet also shows that a series of magnetic contours suggest faulting of similar strike at and west of the Pancake - Mamainse Lakes area.

It is also noted that the "C" zone and the zone of "Old Indian Copper Diggings" on and at the mining property of Coppercorp Ltd. (Montreal Mining Co. - Sand Bay Location), show a N 15 W and N 20 W strike length respectively. NOTE - See Ontario Department of Mines Map No. 1953-1, Mamainse Point Copper Area.

ASSESSMENT REQUIREMENTS AND STATUS.

Sufficient diamond drilling has been completed to cover the total assessment work of 200 days per Claim as required by the Ontario Mining Act.

For 21 claims, 4200 days of work are required. Diamond drilling has amounted to 5437 feet or days.

However, all of this assessment work has not been filed at this date. It will be noted that all of the 21 claims are secured by filed and accepted "Reports of Work" up to and including 1965, and all but 6 claims until 1966.

See Table under "Identification of Property and Location" herein.

CONCLUSIONS

In my Report of November 8th, 1963, I stated under "Conclusions" that --

Quote - "It is considered that prior to the current summer (1963) season, the use of modern geophysical survey methods has not played a part in wide-spread and detailed prospecting of this area."

"Therefore, it is possible that the use of such methods and application to the greater proportion of the area may be instrumental in locating additional copper deposits."

"Such deposits are likely to be located in and along the juncture of or trace of structural faulting and in the near vicinity of minor and mineralized 'showings" which have been identified in the past."

"These conditions have been established, in part, within the boundary of the mining claims discussed herein." - Unquote.

The ground geophysical survey of the area of the aero-magnetic "Low" anomaly was instrumental in guiding the subsequent Preliminary Diamond Drilling Program into structural formation that disclosed copper sulphide mineralization which was new and heretofore unknown.

Although the diamond drilling, so far, has failed to disclose economic copper ore, there is no reason to terminate development.

It is my contention that a very small percentage of the anomalous mass has been partially tested.

The anomalous conditions persist south-easterly from the sections exemplified by Diamond Drill Holes 1, 3, 5, 7, 8, 9 and 10 for a distance of some 1200 feet.

In addition, and at this stage of development, an effort should be made to expurgate the probability that the control of mineralization might be in a horizontal attitude.

With these factors in mind and accepting the fact that weather conditions of this area will deteriorate in late November to a point where diamond drilling is difficult and costly, a recommendation on immediate and additional development is modified by specific reservations.

Therefore, for the remaining current season, a minimum program of diamond drilling which could lead to, locate and find structural conditions, hence tonnage, that would yield a copper content of economic grade, should be considered and does not detract in any manner the potential characteristics and merit of the property and the mineralization therein.

RECOMMENDATION

Based on the premises expounded under "Conclusions", a program of diamond drilling in the amount of 2500 feet to be expended in five (5) holes is recommended.

The arrangement of the five (5) holes is described thus:-

First Hole - At the site of No. 1 (Preliminary Program).
To be drilled @ 90 Degrees for 500 feet to determine and/or disprove the probability of a flat dip to the attitude of known mineralization.

Second Hole -Site of collar at 700 North and 450 East.
To be drilled N 80 E @ 45 Degrees for 500 feet to test the E-M anomalous "cross-over" and "High-Low" magnetometer contact at the site of the original and undrilled No. 2 Hole of the Preliminary Program.

Third Hole - To be drilled parallel to and 300 feet south of the second hole @ 45 Degrees for 500 feet.

Fourth Hole- To be drilled parallel to and 600 feet south of the second hole @ 45 Degrees for 500 feet.

Fifth Hole - To be drilled parallel to and 900 feet south of the second hole @ 45 Degrees for 500 feet.

NOTE - The third, fourth and fifth holes are exploratory or preliminary holes located in such a manner as to test the south-easterly extension of the assumed N 18 W strike fault zone.

COST OF ADDITIONAL DRILLING PROGRAM.

1.	Diamond Drilling, extras - 2500 feet at $4.00 per foot	$ 10,000.00
2.	Supervision, travel, assaying, et al.	5,000.00
	Total	$ 15,000.00

This is my Progress and Development Report for the

Period: February 27th to August 21st, 1964.

Respectfully submitted,

"A. W. JECKELL"

Allen W. Jeckell, B.A.Sc., P.Eng.,
Consulting Mining Engineer.

Dated - October 15th, 1964.

C E R T I F I C A T E

I, ALLEN WRAY JECKELL, of the City of Toronto, in the County of York, do hereby certify as follows:-

1. THAT I am Consulting Mining Engineer and have practised my profession in excess of thirty years.

2. THAT I live at 5 Walmsley Boulevard, Toronto 7, Ontario.

3. THAT I am a Registered Professional Engineer in the Province of Ontario and in the Province of Quebec.

4. THAT I am a Graduate Mining Engineer with the Degree of Bachelor of Applied Science (1927) of the University of Toronto.

5. THAT this Progress and Development Report, dated October 15th, 1964, which covers the development work undertaken on the Jogran Mines Ltd. mining property in Ryan Township, has been made on behalf of McKinney Gold Mines Ltd., Suite 506, 540 Burrard Street, Vancouver, British Columbia.

6. THAT the content of this Progress and Development Report is based on personal supervision and resident direction of the Diamond Drilling and other development during the period February 27th to August 21st, 1964.

7. THAT I have no interest either directly or indirectly in this mining property nor do I expect to receive any interest directly or indirectly in the securities of Jogran Mines Ltd. or McKinney Gold Mines Ltd.

DATED this 15th day of October, 1964.

A. W. JECKELL

Allen W. Jeckell, B.A.Sc., P.Eng.,
Consulting Mining Engineer.

April 30, 1980,

Mr. Dave McAuslan,
Manager Exploration, Eastern Division,
Shell Canada Resources Ltd.,
505 University Avenue,
TORONTO, Ontario.

Dear Mr. McAuslan:

Following my conversation earlier this week with Mr. Ernie Gallo, we are enclosing a proposal for an exploration agreement with Shell. The Jogran property is one of the outstanding exploration prospects in the Batchawana area which has only recently been consolidated under our ownership. This molybdenum-copper-tungsten occurrence not only has significant drill-indicated reserves but also has outstanding exploration potential. It deserves the attention of any company interested in building molybdenum reserves or exploring for tungsten.

We also have a number of other claim groups in the same area which are held by myself and my partner Mr. Palumbo, or by myself. These properties may also be included if you wish.

The Jogran prospect was discovered in the 1960's and tested by nearly 20,000 feet of drilling, worth over a quarter million dollars at today's prices. Although the prospect was uneconomical in 1960, the drilling may be considered successful under today's conditions. Over 14 million tons of reserves containing 0.2% Cu and 0.05% MoS_2 are drill indicated, with much larger tonnages in the prospective category since the drill indicated zone is open in all directions.

In addition to the indicated reserves, the prospect has value because there are excellent chances for discovery of higher grade zones or new zones at depth. Recent discoveries in similar environments clearly indicate that deep exploration of this area for copper, molybdenum and tungsten is warranted. Exploration models are discussed in the proposal.

Continued Page 2 -----

We own the Jogran property outright and are in a position to deal it to Shell on an option basis or other arrangement. Our objectives in such a deal are to obtain a cash payment, royalty or retained interest and a work or expenditure commitment to ensure that the property will be thoroughly tested and brought to production. If it is satisfactory to your company, I would also be interested in managing the project subject to your direction.

Subject to further discussion and review in terms of your company's objectives and strategy, tentative proposed terms for sale of this property are as follows:

1) Shell shall commit to expend at least $100,000 in exploring the property in the first year.

2) Shell shall make cash option payments to the vendors as follows, which shall not be considered exploration expenditures:

   a) on signing - $75,000
   b) annually for 3 years - $100,000
   c) on exercise of option for 80% $500,000

3) Shell will earn an interest in the property for expenditures as follows:

   a) for first $500,000 in exploration expenditures within 4 years - 40%

   b) for next $1,000,000 in exploration or development expenditures within 4 years - 40%

   80%

4) The vendors will retain a 20% interest which will become a participating interest for any expenditures beyond 1.5 million.

5) At the option of the vendors, the 20% participating interest may be converted to either:

   a) a 2% non-assessable N.S.R. royalty

   b) a 10% non-participating net profits interest

Continued Page 3 ------

We would appreciate the opportunity to meet with you to discuss these terms with you further to see how they can best be fitted to your company's objectives. An inspection of the records and the property can also be arranged soon, as the snow is now gone and the lake is open.

Yours very truly,

Roy J. RUPERT.
