Map 1 Property Geology

1.0 INTRODUCTION: (Figure 1)

The Oil City property is located in the Pilot Harbour portion of the Mishibishu greenstone belt near Wawa, Ontario, and consists of a group of 50 contiguous claims. Noranda Exploration Co., Ltd. entered into a joint venture agreement with Central Crude on July 7, 1988, in which Noranda can earn 50% interest in the property. The purpose of the joint venture is to explore for gold deposits in the area. To date, three ore zones have been discovered along the Mishibishu belt; the Magnacon Zone (Muscocho-Flanagan McAdam-Windarra) hosts reserves of about 1.3 mt of 8.6 g/t gold, while the Mishibishu Main Zone (McMillan-Granges) has indicated reserves of 1.1 mt of 5.7 g/t gold; and the Central Crude-Hemlo deposit of 1.7 mt of 8.23 g/t cut.

2.0 LOCATION AND ACCESS:

The Mishibishu Greenstone Belt is located immediately north of Lake Superior, between Wawa and Hemlo. Road access is available to the belt via a gravel road from Highway 17 (50 km northwest of Wawa) to the vicinity of Noranda's Cameron Lake camp. Property access is then best achieved by helicopter or a by a float-equipped aircraft onto Pipe Lake.

3.0 PROPERTY DESCRIPTION

3.1 Disposition Status (Figure 2)

The Oil City property consists of 50 contiguous unpatented mining claims located in the Pilot Harbour area in the Sault Ste. Marie mining division. The claim numbers are :

SSM 1037323 to SSM 1037362 inclusive

SSM 1037393 to SSM 1037402 inclusive

All claims are currently held in good standing. Assessment is due November 19, 1991.

3.2 Joint Venture Status

An option agreement was signed between Noranda Exploration Company, Limited and Central Crude Explorations Limited dated July 7, 1988 giving Norex the sole right to earn into the 50 original claims of the property to 50%. In order to earn this interest, Norex must make total exploration expenditures of

\$1,000,000 before May 30, 1991. Noranda is the operator of the work programs on the project.

3.3 Physiography

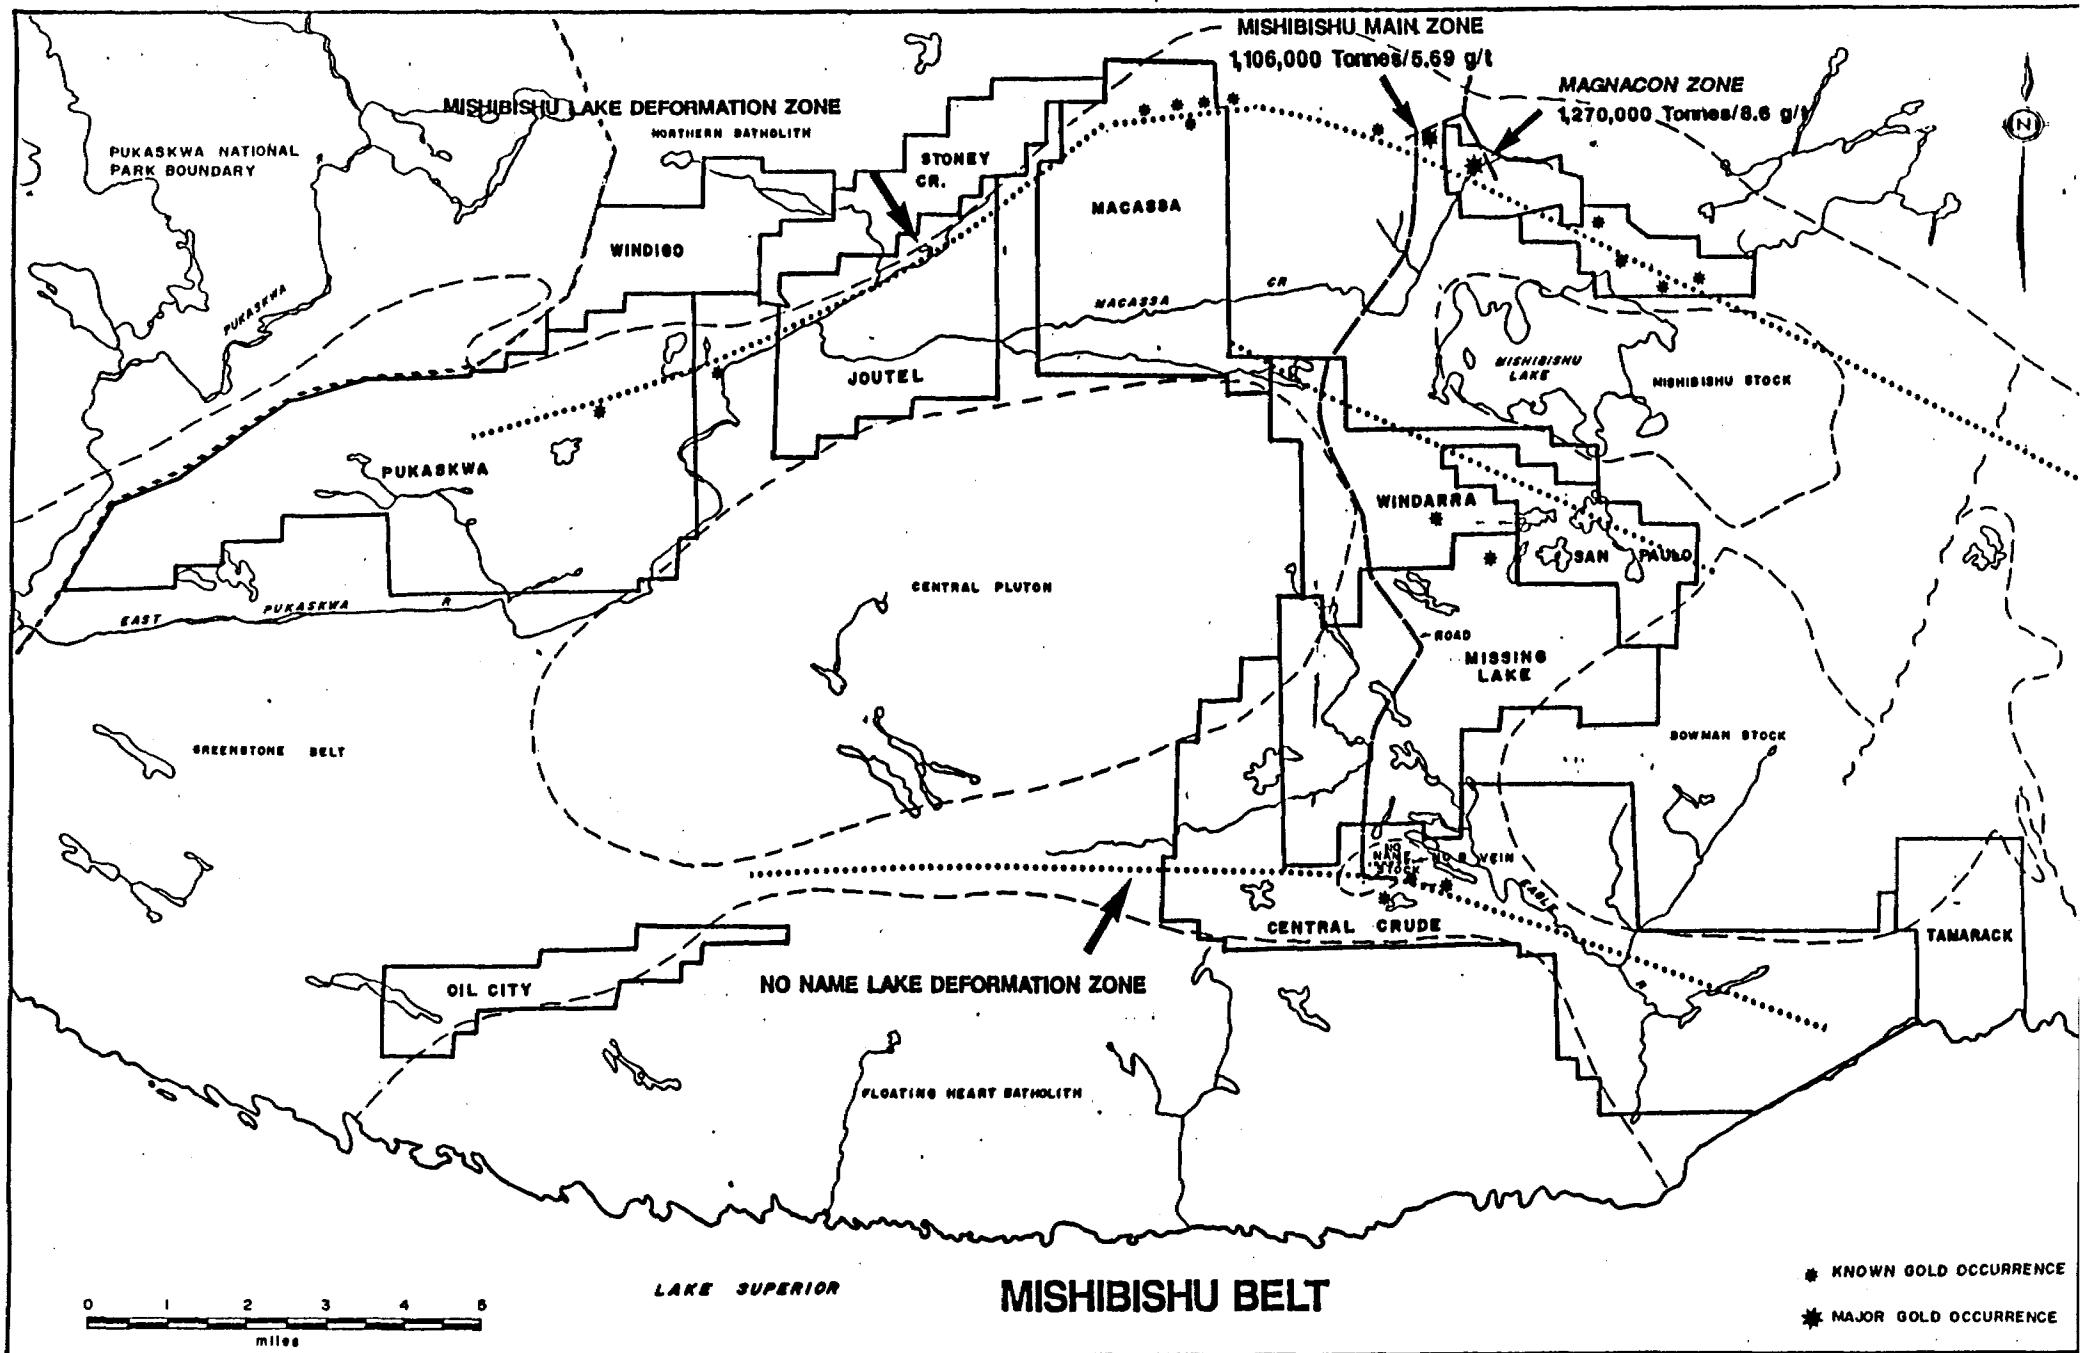

The area is dominated by east-west trending bedrock ridges, covered with a discontinuous mantle of locally derived glacial till. Between the ridges are low, wet areas with only occasional outcrop. The centre of the property is masked by a thick glacio-lacustrine sand plain.

Vegetation is poplar, maples and pines on the hills, spruce, cedar and alders in the lows.

4.0 REGIONAL GEOLOGY (Figure 3)

The Mishibishu Greenstone Belt is of Archean age, and comprises part of the Abitibi-Wawa-Shebandowan subprovince of the Canadian Shield. The rocks consist of predominantly mafic to intermediate metavolcanics, with minor felsic metavolcanics, and associated interbedded metasediments which are predominantly arkosic in nature. They form an arc-shaped, synformal belt separated into limbs by three large, felsic intrusives. The supracrustal rocks have been intruded by early Precambrian gabbroic bodies, while the entire sequence is cut by mid to late Precambrian diabase dykes and Proterozoic lamprophyre dykes.

Large scale folds and faults are not readily evident within

belt, although smaller such structures are seen locally. The structural features observed are linear deformation zones which shearing, alteration, etc. are more concentrated. These oriented sub-parallel to the local stratigraphy, both of which wrap around the large felsic intrusive bodies.

Metamorphism has generally been recorded as mid to lower schist facies, with minor, high rank metamorphism evident from felsic intrusions.

PROPERTY GEOLOGY(Map 1)

The claims lie on the south limb of the Mishibishu limestone belt, on strike with the Central Crude - Hemlo Gold River deposit.

The mapping on the property was on north-south lines spaced apart. The lines were cut every 400m, with chained and bridged lines in between.

The lithologies comprise mostly of east-northeast to east-east striking mafic to intermediate volcanics that dip moderately to the north. Across the middle of the property a bimafic mafic unit extends to the east where it and the volcanics are truncated by the dioritic Southern Batholith.

Later diabase dykes trend northwest across the property and likely are following fractures.

The tuffs and lapilli-tuffs contain a large percentage of small feldspar phenocrysts with rounded shape. There are also mafic grains and occasional rounded quartz eyes.

Units 5, 7 - Felsic Intrusives

The Southern Batholith appears as two different phases. A quartz poor dioritic intrusive to the east and as a biotite-hornblende granodiorite to the south-east. Zenoliths of mafic rock are common, showing amphibolite metamorphism towards their contacts.

Unit 9 - Diabase Dykes

The dykes in the region are equigranular, medium grained, magnetite-epidote bearing intrusives with traces of pyrite plus very rare pyrrhotite. They trend WNW, generally dip vertically, and are most concentrated in the SW corner of the property. Two N-S dykes in this area appear to act as feeders to the many smaller dykes.

Continuous magnetic trends have been found to correlate with certain diabase dykes, it is conjectured that they are late-stage dykes, and thus have a stronger signature than the earlier dykes.

6.0 STRUCTURE

The major lineaments on the property are the west-northwest valleys parallel to Pipe Lake and north-northwest valleys which control drainage from the property. North trending diabase dykes also seem to fill faults, as in the southwest. Alteration associated with these northwest trending faults is epidote, carbonate and quartz, with some brecciation along the valley floors. Offset appears dextral.

7.0 DISCUSSION

The predominance of mafic and intermediate volcanics on the property without any time break indicated by a sediment unit is discouraging. Alteration and shearing was lacking in almost all the outcrop, except for a zone around L151E 107N. The type of quartz veining and shearing that hosts the Eagle River deposit was not observed on the property. The northwest faults seem to be the only sources of any alteration observed. The intrusive bodies, where cut by a cross-lineament, show some silicification and, with other such lineaments, deserve further work.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The property has now been covered by a geological survey and by prospecting. Results and geology are not encouraging to

finding mineralization on the claim group.

Since what alteration that exists is controlled by structural features, a detailed, intensive mapping and prospecting program should occur in and around these valleys. Any favourable showings can be trenched and sampled by either bulk or channel samples.

More intensive shallow exploration drilling should then be considered pending favourable results.

STATEMENT OF QUALIFICATIONS

I, Michael J. Miller of Noranda Exploration Company, Limited do hereby certify that:

1. I am a geologist residing at 36 Fernwood Park Ave., Toronto, Ontario, M4E 3G1.
2. I am a graduate of Brock University.
3. I have practiced my profession for three years and supervised the work carried out in this report.
4. I do not directly or indirectly hold an interest in the property.

1.0 INTRODUCTION: (Figure 1)

The Oil City property is located in the Pilot Harbour portion of the Mishibishu greenstone belt near Wawa, Ontario, and consists of a group of 50 contiguous claims. Noranda Exploration Co., Ltd. entered into a joint venture agreement with Central Crude on July 7, 1988, in which Noranda can earn 50% interest in the property. The purpose of the joint venture is to explore for gold deposits in the area. To date, three ore zones have been discovered along the Mishibishu belt; the Magnacon Zone (Muscocho-Flanagan McAdam-Windarra) hosts reserves of about 1.3 mt of 8.6 g/t gold, while the Mishibishu Main Zone (McMillan-Granges) has indicated reserves of 1.1 mt of 5.7 g/t gold; and the Central Crude-Hemlo deposit of 1.7 mt of 8.23 g/t cut.

2.0 LOCATION AND ACCESS:

The Mishibishu Greenstone Belt is located immediately north of Lake Superior, between Wawa and Hemlo. Road access is available to the belt via a gravel road from Highway 17 (50 km northwest of Wawa) to the vicinity of Noranda's Cameron Lake camp. Property access is then best achieved by helicopter or by a float-equipped aircraft onto Pipe Lake.

3.0 PROPERTY DESCRIPTION

3.1 Disposition Status (Figure 2)

The Oil City property consists of 50 contiguous unpatented mining claims located in the Pilot Harbour area in the Sault Ste. Marie mining division. The claim numbers are :

SSM 1037323 to SSM 1037362 inclusive

SSM 1037393 to SSM 1037402

All claims are currently held in good standing. Assessment is due November 19, 1991.

3.2 Joint Venture Status

An option agreement was signed between Noranda Exploration Company, Limited and Central Crude Explorations Limited dated July 7, 1988 giving Norex the sole right to earn into the 50

OIL CITY

Norex-Hemlo Gold

original claims of the property to 50%. In order to earn this interest, Norex must make total exploration expenditures of \$1,000,000 before May 30, 1991. Noranda is the operator of the work programs on the project.

3.3 Physiography

The area is dominated by east-west trending bedrock ridges, covered with a discontinuous mantle of locally derived glacial till. Between the ridges are low, wet areas with only occasional outcrop. The centre of the property is masked by a thick glacio-lacustrine sand plain.

Vegetation is poplar, maples and pines on the hills, spruce, cedar and alders in the lows.

4.0 REGIONAL GEOLOGY

The Mishibishu Greenstone Belt is of Archean age, and comprises part of the Abitibi-Wawa-Shebandowan subprovince of the Canadian Shield. The rocks consist of predominantly mafic to intermediate metavolcanics, with minor felsic metavolcanics, and associated interbedded metasediments which are predominantly arkosic in nature. They form an arc-shaped, synformal belt separated into limbs by three large, felsic intrusives. The supracrustal rocks have been intruded by early Precambrian gabbroic bodies, while the entire sequence is cut by mid to late

Precambrian diabase dykes and Proterozoic lamprophyre dykes.

Large scale folds and faults are not readily evident within the belt, although smaller such structures are seen locally. The major structural features observed are linear deformation zones in which shearing, alteration, etc. are more concentrated. These are oriented sub-parallel to the local stratigraphy, both of which wrap around the large felsic intrusive bodies.

Metamorphism has generally been recorded as mid to lower greenschist facies, with minor, high rank metamorphism evident near felsic intrusions.

5.0 SOIL GEOCHEMISTRY

A soil geochemistry survey was conducted over the entire property by Noranda personnel and a contract crew from Exsics Exploration during the summer of 1989. This work involved the collection of 'B' horizon soil ('Ah' horizon soils where necessary) at 25 meter stations along picketed and flagged lines. The samples were field dried and shipped to Chemex Labs Ltd. to be analyzed for gold and/or a 32 element trace using Atomic Adsorption & ICP techniques respectfully. A total of 199 'A' horizon and 2374 'B' horizon samples were collected during the survey. The purpose of the work was to provide complete grid coverage so as to identify zones of anomalous gold and provide

targets for further prospecting and follow-up.

6.0 DISCUSSION OF RESULTS

The Oil City property has been covered completely by a soil survey carried out by Noranda Exploration Company, Limited.

Sampling of 'B' Horizon (Ah where necessary) and Au analysis of 2573 samples yielded results of low values, with very weak trends. The 32 element ICP package failed to show any significant highs from 520 samples.

In the soils there were only 4 gold values greater than 100 ppb, the highest being 120 ppb. Scattered values between 15 and 100 ppb occur, but rarely as a trend. Chart 1 shows the location and values for significant results.

ANOMALOUS GOLD SOIL VALUES

EASTING	NORTHING	VALUE (ppb)
L111E	101+75N	100
L136E	101+75N	114
L136E	107+25N	100
L166E	110+75N	120
L100E	95+25N	75
L112E	96+00N	50
L112E	96+25N	70
L112E	98+25N	60
L124E	98+50N	60
L135E	100+50N	61

7.0 CONCLUSIONS & RECOMMENDATIONS

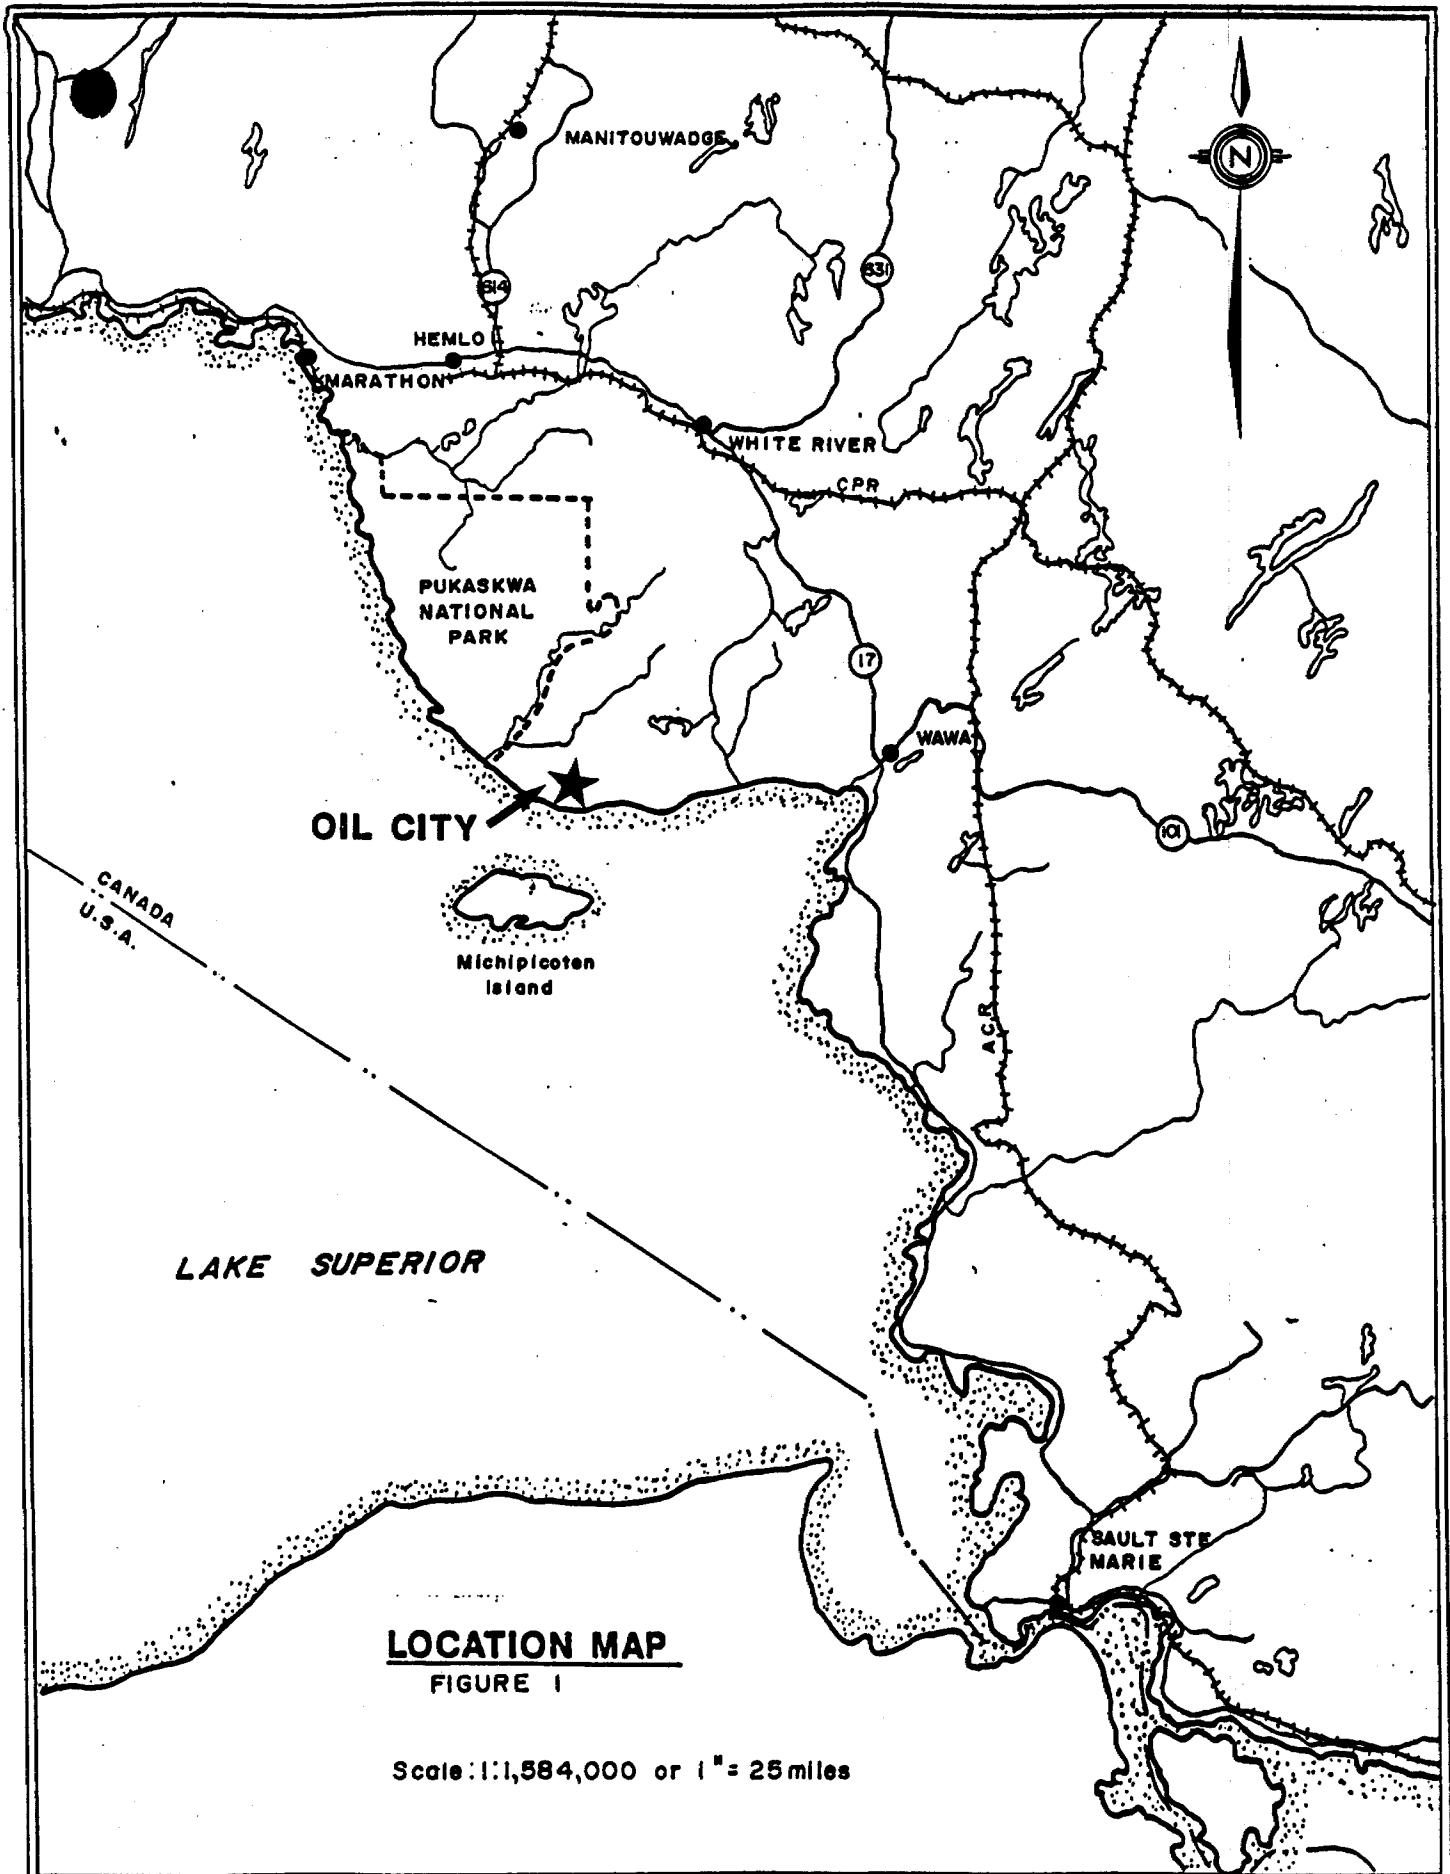

The soil values returned little encouragement for gold mineralization on the property. The thick lacustrine plain in the centre of the property may mask some mineralization that was not picked up by the soils.

A follow-up of the soil samples should involve prospecting around the high values. Any mineral occurrence discovered from this activity can then be mapped and sampled in detail.

NORANDA EXPLORATION CO., LTD.
 PROJECT : 1118
 P.O. # :

Samples submitted to our lab in Mississauga, ON.
 This report was printed on 1-AUG-89.

SAMPLE PREPARATION

CHMEX CODE	NUMBER SAMPLES	DESCRIPTION
201	127	Dry. sieve -80 mesh; soil, sed.
238	127	ICP: Aqua regia digestion

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti. T.L. W.
