REPORT

on a

GEOCHEMICAL SURVEY

on the 44-claim property of

KENTY RESOURCES LIMITED

in Rollo Township

Porcupine Mining Division

Northeastern Ontario

by

Albert Hopkins

Consulting Mining Geologist

RECEIVED
APR 6 1981
MINING LANDS SECTION

627-627-23

INTRODUCTION:

In late March 1982, the Ontario Geological Survey released a series of maps to cover an "Airborne Electromagnetic and Total Intensity Magnetic ("Mag.") Survey, Swayze Area" by Questor Surveys Limited. This aerial survey covers all or parts of over forty townships, an area of some 1,400 square miles.

Many Magnetic and Electromagnetic ("E.M") anomalies ("anoms.") appear on these aerial maps. One of the most interesting ones consists of up to 3 parallel E.M. conductors striking E-W through the south edge of Rollo and the north edge of Swayze Township. The writer recommended the acquisition of some 70 mining claims by staking, and Rollo Prospecting Syndicate was formed for this purpose.

Our staking party, under Ross Toms, entered the area as soon as possible after breakup in 1982, and he succeeded in staking 31 claims for the Syndicate, to cover these aerial anom., being cut off by Argus Hollinger Limited and Dejour Mines Limited on the west, Dome Mines Limited or Coppell Township on the east, and Inco and Swayze Resources Limited ground on the south. Later the 6 Dejour claims were optioned, and 7 additional claims staked, to form a rectangular block of ground 1 mile from north to south, by 3 miles from E-W, in the southeast corner of Rollo Township.

There are very few outcrops and no known mineral showings on this property. The area was well prospected for gold in the 1930's, following the discovery of gold less than a mile to the south in Swayze Township by Jay and Jack Kenty in 1931 (The original Kenty gold mine). Therefore it was decided to explore our large property by geochemical ("geochem.") and geophysical ("geophys.") methods, to be followed by diamond drilling ("d.d.").

PROPERTY:

This consists of 44 contiguous unpatented mining claims in the southeast corner of Rollo Township, Porcupine Mining Division, Northeastern Ontario, numbered as follows:

P. 575240 - 243 incl.	=	4 claims
632126 - 139 incl.	=	14 claims
642257 - 259 incl.	=	<u>3 claims</u>

21 claims

PROPERTY: Continued

Carried Forward	21 claims
642278 - 280 incl.	= 3 claims
650398 - 410 incl.	= 13 claims
672421 - 427 incl.	= <u>7 claims</u>
TOTAL	= 44 claims

LOCATION: N.T.S. 41.0.15

The property, in the S.E. corner of Rollo Township lies in the Swayze gold belt, 72 airmiles (116 km.) SW. of Timmins, 28 airmiles (45km.) S. of Foleyet, a C.N.R. subdivisional point, 35 airmiles (56 km.) due E. of Chapleau, and 44 airmiles (71 km.) WNW. of Gogama, Ontario. The property is $\frac{1}{2}$ mile (0.8 km.) N. of the former small Au-Ag producer, Kenty gold mine, 9 airmiles (14.5 km.) SW. of Sulpetro's former Rundle gold mine, 16 airmiles (26 km.) SW. of Northgate's Orofino gold mine, and 24 airmiles (39 km.) NW. of the former producer, Jerome Gold Mines.

ACCESS:

This property was recently made accessible by motor vehicle, by the building of bridges across Lesage Lake Narrows and Swayze River and the brushing out and bulldozing of old logging roads by contractor for Heron Resources Limited, who are the present owners of the old Kenty gold mine, $\frac{1}{2}$ mile S. of our property, in Swayze Township. One may drive from Foleyet on Highway 101, about 4 miles (6.4 km.) W., and then S. through Ivanhoe Lake park, about 40 miles (64 kms.) on a gravel road, to the property.

A timber company, Orofino Mines, and Sulpetro Minerals keep this road snowplowed during the winter, to the Orofino turn-off, leaving the last 10 miles of our road snowbound at present, in winter, necessitating snowmachines for the last 10 miles.

GENERAL GEOLOGY:

The property lies in the E-W trending Swayze greenstone belt, which is about 28 miles (45 km.) long and 18 miles (29 km.) wide. The rocks are all Precambrian in age, and are steeply-dipping in fold structures, whose axes trend in a sinuous E-W path across the area. The Keewatin rocks include rhyolite, trachyte, dacite, andesite, pillow lava and basalt, as well as tuffs,

GENERAL GEOLOGY: Continued

agglomerates and breccias. The Timiskaming sediments as well as the metavolcanics are intruded by many quartz and felspar porphyries, not unlike the Kirkland Lake geology.

LOCAL GEOLOGY:

Although the property is 95% overburdened, the geology has been estimated through extrapolation from outcrops some distances to the E. and W.

The property is believed to be mainly underlain by an E-W fold, probably the N. limb of an E-W syncline, consisting of sediments and volcanoclastics from 0.25 miles to 0.35 miles (0.48 km.) in width.

PICKET LINE GRID:

A grid of Picket Lines ("P.L.'s") was cut across this property totalling 43.34 line-miles or 69.74 line-kms. The Baseline ("B.L.") strikes 93.5° , with P.L.'s normal to it at 120^{m} . intervals. Pickets were chained and labelled at 30^{m} . intervals along these lines. The cost of these lines was \$6,853.00.

GENERAL GEOCHEMICAL CONSIDERATIONS:

- (a) There are several sensitive methods for the accurate determination of gold in geological materials. Gold is often unevenly dispersed in its host rocks, so proper sampling procedures are essential.
- (b) Some of the obvious advantages of geochemical prospecting such as the absence of expensive instrumentation, rapid operation and flexibility in the search for different types of ore deposits have been highlighted by the current economic recession and consequently, the need to obtain the most value for limited exploration dollars. Geochemistry is most effective in areas where mineralization is exposed at surface or is relatively close to the surface. However, with the increasing intensity of exploration through ground and remote sensing techniques, the majority of near-surface deposits with

GENERAL GEOCHEMICAL CONSIDERATIONS: Continued

(b) some visible expression have been identified and strategy must focus on detecting the more deeply concealed targets. Less conventional methods must therefore be considered in the search of buried mineralization.

The objective of geochemical prospecting is, of course, to discover an economic mineral deposit by systematic measurement of one or more chemical properties (generally trace element content) in naturally occurring materials such as rock, soil, stream sediment, water and vegetation. Analytical data is generated to detect abnormal chemical patterns known as anomalies and through interpretation, hopefully, to relate these anomalous patterns to a mineral source.

OUR GEOCHEMICAL PROCEDURES:

(a) Collection of Samples:

The writer and his assistants collected some 2,970 soil samples from the "A Horizon" (black humus) mainly at 15^m. intervals along the P.L.'s. The intermediate stations were located by pacing between the 30 meter picket intervals.

Clean stainless-steel scoops or garden trowels were used for sampling the humus, generally in the top first foot of decomposed vegetation soil. Care was taken to include no clay or sand and a minimum of wood. Samples averaged about $\frac{1}{2}$ pound (225 g.) in weight. Tough new kraft paper bags or special cloth bags were used to contain the samples. These bags were clearly marked with the name of the property, the date, sampler's name or initials, and the sample location co-ordinates, e.g. 300 S., 1,560 E. These co-ordinates became the sample numbers.

(b) Sample Analyses:

The soil samples were delivered to Assayers (Ontario) Limited in Islington, Toronto, Ontario, and there they were all analysed for Au and Ag, and some also for Cu and Zn. Analyses were reported in the following units:

OUR GEOCHEMICAL PROCEDURES: Continued

<u>(b)</u>	<u>Metal</u>	<u>Content In</u>	<u>Assumed B.G.</u>	<u>Minimum Anomalies</u>
	Au	ppb.	5 ppb.	5 XBG. or 25 ppb.
	Ag	ppm.	0.1 ppm.	10 XBG. or 1 ppm.
	Cu	ppm.	10 ppm.	5 XBG. or 50 ppm.
	Zn	ppm.	20 ppm.	5 XBG. or 100 ppm.

(c) Plotting and Contouring of Maps:

Two basemaps were drawn, one covering the E. half and the other, the W. half of the property. Analyses are plotted as XBG. on these maps (Scale: 1:2500 or 1" = 208.33' or 64.74^m). Where only Au and Ag were analysed, the analyses are plotted as XBG. thus: - Au-Ag. Where all 4 metals were analysed, they were reported thus: - Au | Cu
 Ag | Zn

The gold Back Grounds only were plotted and contoured, with the following contour intervals:-

10 - 50 XBG.
50 - 100 XBG. (on these 1:2500 Scale sheets)
100 XBG and over.

The property was also mapped for more detail in 32 sheets, scale: 1" = 30^m or 98.425'. These 32 individual sheets have the gold Back Grounds only plotted and contoured with the following contour intervals:-

5 - 10 XBG.
10 - 20 XBG.
20 - 50 XBG.
50 - 100 XBG.
100 XBG. and over.

DISCUSSION OF SURVEY RESULTS:

There are 54 gold anom. contoured on the property. Of these, the W. $\frac{1}{2}$ has only 14 gold anom. of between 10 and 49 XBG. While the E. $\frac{1}{2}$ has 40 anom. of which 4 rise higher than 50 XBG. and 6 more higher than 100 XBG. It would thus appear that the E. half of the property probably contains more gold than the W. half. This may be due to porphyry intrusions, the possible source of the gold, being mapped to date to the SE. of our property (by Rickaby) and S. of the E. half of the property (on the

DISCUSSION OF SURVEY RESULTS: Continued

Heron Resources Limited property).

At the very time of writing this report, preliminary field results have arrived from the Induced Polarization ("I.P.") survey being performed on the E. $\frac{1}{2}$ of this same property by Rayan Exploration Limited. They have obtained various Chargeability and Resistivity anom. and given them numbers. Six of their anom. conform quite nicely with six of ours, so I shall use their same Anomaly Numbers 1 to 7. Their I.P. report is being prepared quite separately from this one, and will soon be available.

Anomaly # 1:

This comprises several separate geochem. anom. stretching from (145^m S., 600^m E.) to 150^m S., 840^m E.), with readings up to 141 XBG. Au and 129 XBG. Ag. This roughly coincides with I.P. medium Chargeability Anom. # 1, and a low Resistivity Zone. It should make a high drill target priority.

Anomaly # 2:

The I.P. anom. stretches from (615 S., 960 E.) to (810 S. 1920 E.). Its Chargeability is high and very wide, centred at (750 S., 1560 E.). Its Resistivity is very low. It could be an E.S.E. extension of Anom. # 1. It trends E.S.E. across the township line, from the Kenty to the Swayze Resources Limited property, where the geochem. anom. gives readings up to 29 X Au. BG. and 9 X Au. BG. It could be caused by graphite or massive sulfids.

Here a joint D.D.H. with Swayze Resources Limited might be considered. This anom. is probably one of the published aerial conductors.

Anomaly # 3:

This area has the largest and widest series of strong geochem. anom. on the property. They spread from McCollum Pond at the N. boundary (S. boundary of Hanson Lake Resources Limited) i.e. from (900 N., 1560 E.) to (660 N., 1560 E.) a width of 240^m and from (915 N., 1320 E.) to 870 N., 1920 E.) a length of 600^m.

DISCUSSION OF SURVEY RESULTS: ContinuedAnomaly # 3: Continued

Approximately mid-way in this geochem. anom. is a very weak chargeability but High resistivity anom., at 725 N., 1560 E., suggesting a siliceous or wide quartz zone.

This should be one of the top drill targets.

I.P. Anomaly # 4 And 4a:

These do not conform with any geochem. anom. However I.P. # 4b is close to a medium geochem. anom. at 1560 E., 30 N. The I.P. at (70 N., 1680 E.) has strong or high chargeability and high resistivity, denoting a possible siliceous or quartz zone with disseminated sulfids. This is a candidate for a drill hole.

Anomaly # 5:

One of the highest geochem. Au readings on the property occurs on the E. boundary or township line at (45 N., 2466 E.) (260 XBG. Au.), and is open to the E. into Coppell Township (Dome Exploration Limited). This pretty well coincides with I.P. anom. # 5, (15 N., 2400 E.). The I.P. anom. extends W. from (15 S., 2280 E.) and then again # 5a anom. at 15 S., 2040 E.). The I.P. anom. have weak chargeability but high resistivity suggesting very low sulfids, and a siliceous or quartz zone. This good drill target on the E. property border should be shared with Dome Exploration Limited.

Anomaly # 6:

This is mainly a massive I.P. Chargeability Anomaly stretching right across the E. half of the property, conforming with the main published aerial E.M. conductor. It has widths up to 350^m, and very low resistivity readings. It therefore appears to be a sedimentary band possibly argillite, containing much graphite, a possibility of sulfids, but low in quartz.

In its great length there are only 4 small geochem. anom. of low to medium strength in gold, i.e. at (90 N., 120 E.), (360 S. 1560 E.), (330 S., 2160 E.), and (300 S., Township Line), not a very high priority!

DISCUSSION OF SURVEY RESULTS: ContinuedAnomaly # 7:

This has no geochem. expression, but is a good I.P. anom. It occurs at (15 N., 1080 E.), and has a high Chargeability and a medium high Resistivity.

This might be called a drill target.

There are about 40 other geochem. anom., but they are either too low in Au to have drilling priority, or they do not coincide with I.P. anom., e.g. at 480 S., on the E. township line. This geochem. anom. gives 143 X Au BG., and might be of interest to Dome Exploration Limited.

CONCLUSIONS:

1. This geochem. survey of nearly 3,000 "A Horizon" soil samples covering the 44 claim Kenty Resources Limited property at fairly close intervals, was analysed for Au and Ag, (plus a few Cu's and Zn's.)
2. The survey indicated no base metal ore deposits, but gave some 54 Au anom., some of which carried Ag values.
3. The E. half of the property contains 40 of the 54 anomalies, including the largest and highest in gold. The W. half of the property probably lacks porphyry intrusives, the likely source of the gold.
4. This property has extensive overburden, and no surface mineral showings. The former Kenty gold mine lies half a mile S. of the E. half of our property.
5. Six of the geochem. anomalies coincide closely with six anomalies from an I.P. survey completed by Rayan Exploration Limited on the same property very recently.
6. These 6 anomalies qualify as prime drill targets in the writer's opinion, and warrant early drilling for gold.
7. Two of these anomalies cross the property boundary and these drill holes should be shared by our neighbours.

RECOMMENDATIONS:

It is recommended by the writer that: -

RECOMMENDATIONS: Continued

1. A minimum of 1,500 feet of "BQ" diamond drilling be performed as soon as possible, as detailed in the following Table I.
2. Dome Exploration Limited should be asked to pay for half the cost of drilling Anom. # 5, and Swayze Resources Limited that of Anom. # 2.
3. Further drilling would depend on the results of the above recommended drilling.

Mr. Bruce W. Hanley
Mining Recorder
Ministry of Natural Resources
60 Wilson Avenue
Timmins, Ontario
P4N 2S7

Dear Sir:

Enclosed are two copies of a Notice of Intent with statements listing a reduced rate of assessment work credits to be allowed for a technical survey. Please forward one copy to the recorded holder of the claims and retain the other. In approximately fifteen days from the above date, a final letter of approval of these credits will be sent to you. On receipt of the approval letter, you may then change the work entries on the claim record sheets.

For further information, if required, please contact
Mr. R.J. Pichette at 416/965-4888.

Yours sincerely,

A handwritten signature in black ink, appearing to read "S.E. Gundt".

Notice of Intent
for Technical Reports

1984 06 28

2.6471/1-84

An examination of your survey report indicates that the requirements of The Ontario Mining Act have not been fully met to warrant maximum assessment work credits. This notice is merely a warning that you will not be allowed the number of assessment work days credits that you expected and also that in approximately 15 days from the above date, the mining recorder will be authorized to change the entries on his record sheets to agree with the enclosed statement. Please note that until such time as the recorder actually changes the entry on the record sheet, the status of the claim remains unchanged.

If you are of the opinion that these changes by the mining recorder will jeopardize your claims, you may during the next fifteen days apply to the Mining and Lands Commissioner for an extension of time. Abstracts should be sent with your application.

If the reduced rate of credits does not jeopardize the status of the claims then you need not seek relief from the Mining and Lands Commissioner and this Notice of Intent may be disregarded.

If your survey was submitted and assessed under the "Special Provision-Performance and Coverage" method and you are of the opinion that a re-appraisal under the "Man-days" method would result in the approval of a greater number of days credit per claim, you may, within the said fifteen day period, submit assessment work breakdowns listing the employees names, addresses and the dates and hours they worked. The new work breakdowns should be submitted direct to the Land Management Branch, Toronto. The report will be re-assessed and a new statement of credits based on actual days worked will be issued.

MINING LANDS SECTION

Gentlemen:

Enclosed please find my Report on a Geophysical Survey with maps, in duplicate, performed over 44 Mining claims of Kenty Resources Ltd. (lic. No. T. 1364). The enclosed copy of "Report of Work" claiming 20 man-days per claim was recently filed with the Porcupine Mining Recorder. Enclosed also is the "Assessment Work Breakdown".

Please let us know if any further data are required, and when this work credit has been approved.

Yours truly,

Albert Hopkins, B.A.Sc.

Geologist.
