INTRODUCTION

A program consisting of line cutting, prospecting and mapping, and a B-horizon soil sampling survey was performed over 2 claims consisting of 18 units in the Township of Benton.

The reason for the work was to relocate, reassess and upgrade work previously performed by Weaco Resources Inc. in 1986. This work had identified 6 max-min conductors. The company drilled 3 holes on three different conductors intersecting disseminated to massive sulfides containing low values in gold in two of the conductors.

The best intersection for gold returned 0.09 oz./ton over 5.5 feet in a section of dark grey coloured felsic rock containing fine disseminated magnetite in threads and stringers and ~1% disseminated pyrite within the rhyolite breccia. The massive sulfide sections were not assayed for base metals - Cu, Zn, or Pb.

Weaco interpreted the massive sulfides as being sulfide facies iron formation, however in the core logs no mention was made or indicated the presence of magnetite, chert or jasper. In these sections the massive to semi-massive sulfides are inter-bedded with felsic cherty tuff at the top of an altered felsic volcanic. There is a strong possibility that they are typical volcanogenic massive sulfides instead of sulfide facies iron formation.

The economic implication of this interpretation is much higher.

PROPERTY LOCATION and ACCESS

The property is located in the extreme northeast portion of Benton Township. Access is via the Sultan Industrial Road west from highway 144 for 56 kilometers to the Dore Road. The Dore Road is taken north for 16 kilometers to the Heenan Road and then for a further 12 kilometers north and east into the cut over area. From here a series of skidder roads lead south to the north boundary of the claim block.

PROPERTY

The property consists of 2 -9 unit claims numbered 1235403 and 1235404 for a total of 288 hectares. The claims are recorded in the name of:

Raymond Lashbrook
973 Pine Creek Road
Callander, ON., P0H 1H0

The claims were recorded on Oct. 06, 1998

LINE CUTTING PROGRAM

A baseline was established by turning a line at an azimuth of 205 degrees from the line post 400 meters west of the #4 post of claim 1235404. This line was cut and chained for 200 meters and then the baseline was turned 90 degrees from this line. The baseline was cut for 1650 meters at an azimuth of 115 degrees with lines being established every 100 meters. A chaining error, that was found after some of the lines to the east were cut, occurred between L500W and L400W resulting in 150 meters between these 2 lines.

The line numbering was then changed and a new line 4W was cut resulting in two 50 (2)

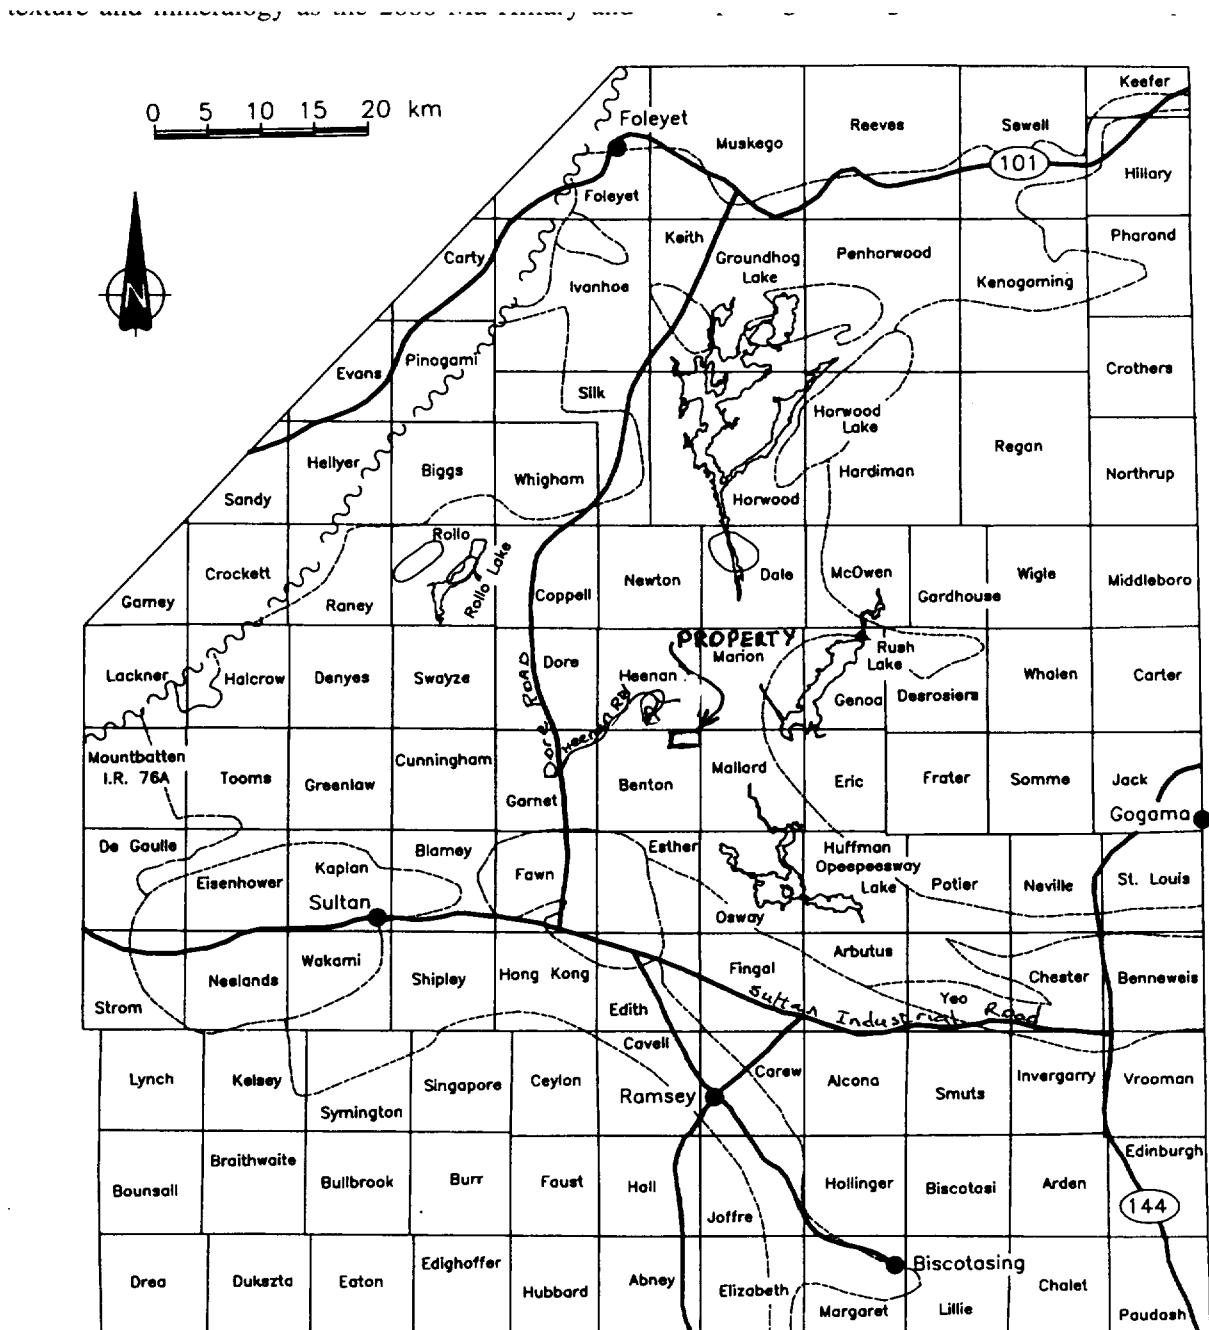

Figure 36.2a. Townships, major lakes and roads (heavy black lines) for the Swayze project area. The distribution of greenstone belt rocks and major intrusions is indicated by the fine dashed lines and shading. This figure is to be used in conjunction with Figure 36.2b.

meter spaced lines and 50 meter numbered lines thereafter. Stations were established every 25 meters along the lines.

The old grid that was cut in 1985 was almost completely obliterated with only a few blazes noted in places.

REGIONAL GEOLOGY

The property lies within the Swayze Volcanic Complex of the Abitibi Sub-province, which is the largest assemblage of Archean meta-volcanics and meta-sediments in the Canadian Shield. The east trending Swayze Belt is 25 kilometers wide at the eastern edge and 74 kilometers long. It is terminated against the Kapuskasing Structural Zone by a north-south trending fault.

Recent re-mapping of the Swayze Belt by Kevin Heather, et al, has redefined the belt by age dating and stratigraphy. The mapping shows that the felsic meta-volcanics and the iron formation belong to the Marion Felsic Volcanic series while the mafic volcanics probably belong to the October Lake Mafic Volcanic series.

PROSPECTING AND GEOLOGICAL MAPPING PROGRAM

Property Geology

The property is located in the Swayze greenstone belt and is underlain by Marion Felsic to Intermediate Package, the Woman River Iron Formations and the October Lake Mafic to Ultramafic Package on the south limb of the Woman River antiform. According to

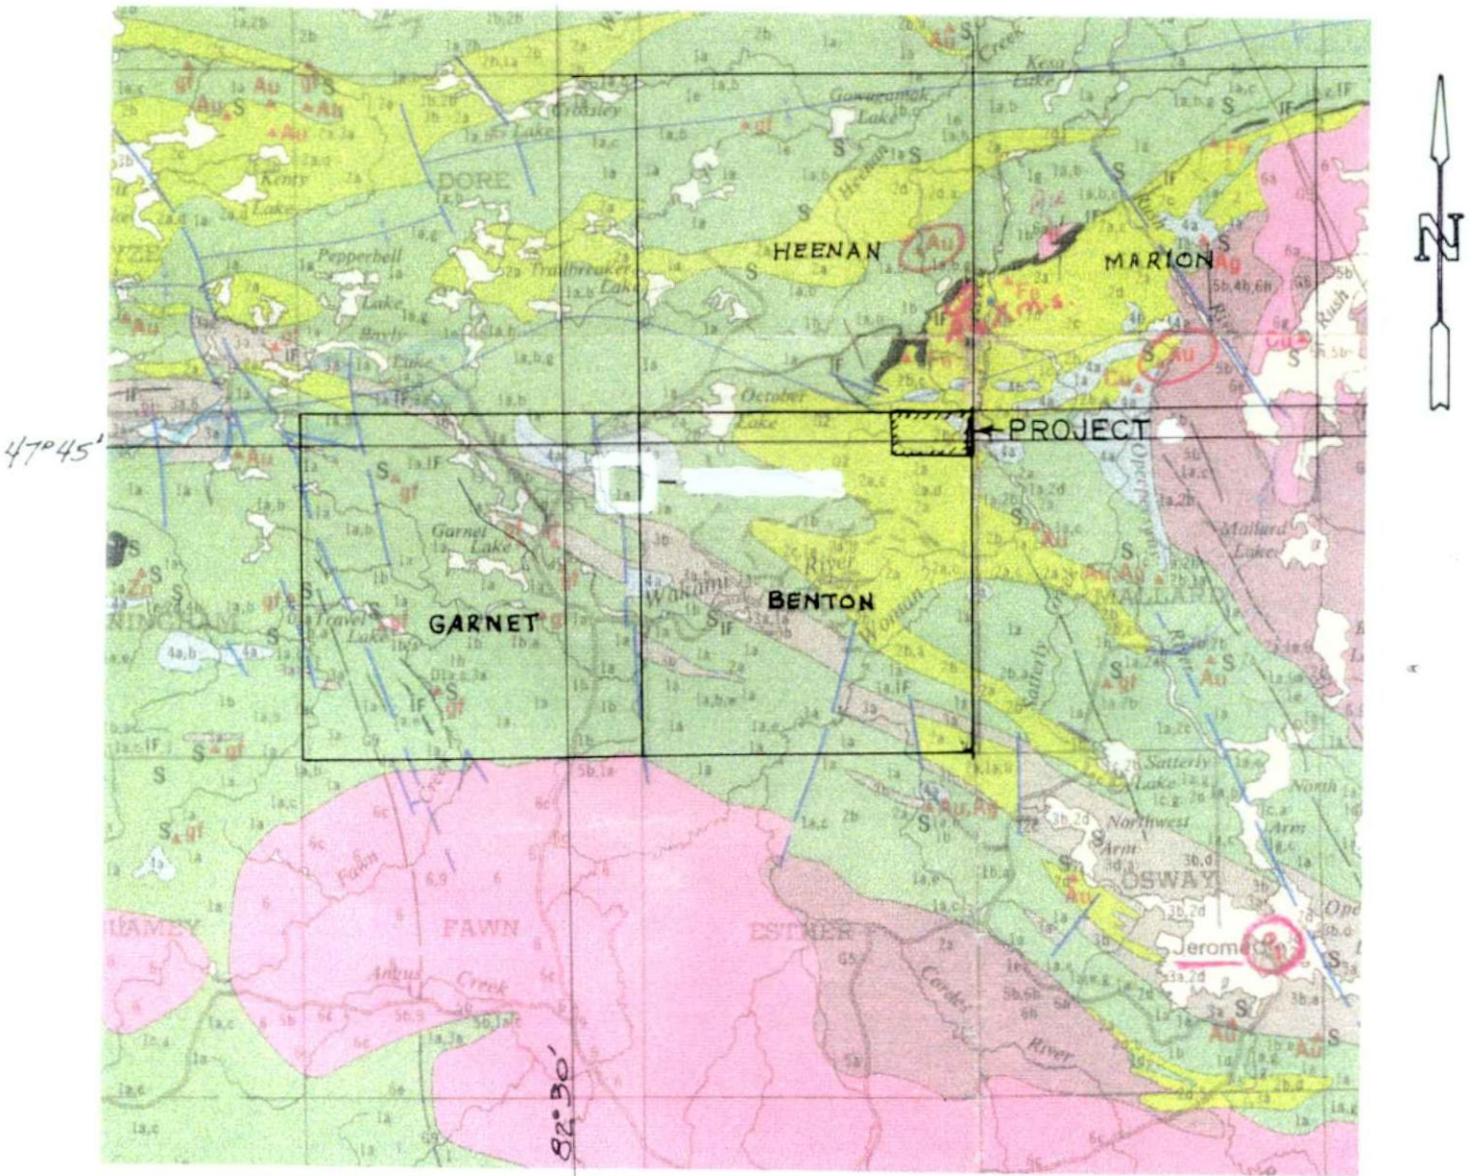

Figure 5- GEOLOGY MAP

Heather this highly attenuated zone has resulted in the dislocation of the Woman River Iron Formation forming isolated boudins and in places a higher degree of alteration, i.e. quartz-sericite alteration of felsic volcanics.

Felsic Volcanics

The oldest units on the property are the felsic volcanics belonging to the Marion Felsic to Intermediate Package (2725 Ma) as defined by Kevin Heather et al, in their recent mapping of the Swayze Belt. These rocks consist of massive flows, breccias and tuffs. In places abundant quartz-eyes can be seen in the fragments along with quartz crystal tuffs (1+75W, 2+50N). The massive flows tend to be not as thick as noted further north in Marion and Heenan Townships. Inter-bedded with the felsic units are thin units of mafic volcanic flows and/or tuffs. The fragmental rocks tend for the most part to be lapilli in size, monolithic and angular. Colour is mainly white to light green in colour with certain areas becoming quite reddish due to alteration (hematitisation) and darker green due to chloritisation.

At 4+90N/0+40E an outcrop of hydro-fractured felsic volcanic with a jigsaw-fit texture consists of angular pink to reddish fragments set in a matrix of very fine grained felsic material, magnetite and pyrite. The magnetite consists mainly of octahedrons to 0.3 mm in diameter. The pyrite is as fine cubes to 0.8 mm. This style of breccia is similar to other locations that contained anomalous gold values in surface and diamond drill core sampling.

Alteration of the felsic volcanics consists of mainly sericite with lesser chlorite. Magnetite was noted in numerous outcrops within breccia zones containing quartz veining and pyrite. Surface sampling of these zones returned values up to 1,539 ppb gold. Good sections through the felsic volcanics can be gleaned from the drill logs in the previous diamond drilling by Weaco Resources Inc.

In diamond drill hole W-86-2 the hole was drilled down stratigraphy and went from mafic volcanics to thin felsic-pyritic (20%) tuffs, to cherty-pyritic (20-65%) tuff/iron formation, to massive pyrite (100%). The massive sulfide unit is in contact with a thin, highly chloritic unit and then into an altered rhyolite breccia. The rhyolite breccia grades down stratigraphy from a chlorite-magnetite matrix to one with sericite and quartz stringers. Further down the hole a 5.5' section described as dark grey colour with finely disseminated magnetite in threads and stringers and 1% pyrite returned a value of 3,040 ppb gold.

In diamond drill hole W-86-1, located over 500 meters to the south of the above drill hole, the felsic volcanics, located stratigraphically below a banded iron formation, consist of a sheared and sericitized crystal tuff unit becoming slightly more chloritic down section. Minor disseminated pyrite, magnetite and chalcopyrite were noted in the hole.

Iron Formation

Over-lying the felsic units are Iron Formations. On the property these consist of two types (a)chert-jasper-carbonate-magnetite to the south and (b) chert-sulfide to the north. On the south side the iron formation noted in outcrop has carbonate units inter-bedded with the chert and jasper and weathers a dark brown. Fine disseminated pyrite was

noted through this outcrop. To the east the intersection in W-86-1 described basically a banded iron formation consisting of chert-jasper-magnetite with minor pyrite and chalcopyrite. No carbonate facies iron formation was noted or possibly just not recognized. The sulfide facies iron formation(?) was intersected in W-86-2 and W-86-3 but was not noted in outcrop. In these drill holes the sulfide facies iron formation is interbedded in the felsic volcanics and is mainly associated with felsic tuff that has been kaolinized and sericitized. Anomalous values up to 990 ppb gold over 0.4 meters was returned from assaying within these sections.

Mafic to Ultramafic Volcanics

The mafic to ultramafic volcanic rocks consists of mainly massive flows that vary from dark green, medium grained to light green, coarse grained dioritic appearing units. Near the baseline several outcrops were found to be weakly to moderately magnetic. To the south some outcrops were stripped that contained pillowd flows. These pillows are generally small with thin selvages. Cherty quartz as vesicle fillings were noted indicating tops to the south to southwest.

Within the diamond drilling numerous intersections of thin basaltic units were described inter-bedded with the rhyolite breccia. In places in outcrop these units were noted to be weakly carbonated. Minor disseminated pyrite was seen in places.

Outcrops of possible diorite were noted in the field, however they were mainly lumped in with the mafic to ultramafic units as more study is needed to determine if they are intrusive or extrusive as no contact relationships were observed. It is probable that they

are the coarser grained central portions of the mafic volcanic flows.

Granodiorite

A granodiorite was logged in W-86-3 and described as being fine to medium grained, massive, pale grey, fresh, slightly magnetic and finer grained at both contacts. This unit is probably a dyke that cuts through the iron formation in this area. No outcrop of this unit was found.

Diabase

Diabase was noted in outcrops on L350E, 1+00S. It is a fine to medium grained, dark green to black.

MINERALIZATION

On the property sulfide mineralization is mainly located within the massive sulfide /exhalite horizon and the underlying zone of hydro-fractured felsic breccia. This massive sulfide horizon has been traced in a northwesterly direction across the northern portion of the property by magnetometer and max-min II geophysics. The underlying hydro-breccia has been located in several outcrops along at least a 600 meter length.

A hydro-fracture breccia normally forms beneath a massive sulfide or iron formation and is the conduit zone that focuses the hydrothermal fluids. On the property the mineralization within the hydro-fracture system is mainly magnetite and pyrite with an appreciable gold content (up to 0.09oz/ton/5.5'). Overlying this system is a massive to semi-massive /cherty felsic tuff horizon. This horizon was not located on surface however it has been intersected by 2 diamond drill holes. This zone was 20.6' thick in W86-2 and 18.5' thick in W86-3. The drill holes are 2,000' apart and were put down to

test a coincidental max-min II/magnetic anomaly that is at least 5,600' long.

The massive sulfides appear to be only pyrite however no assays were done for base metals. Minor disseminated chalcopyrite was noted in drill hole W-86-1.

SOIL SAMPLING GEOCHEMICAL PROGRAM

The soil sampling program was designed to cover areas thought to have a higher mineral potential. These areas were chosen from the recent mapping and prospecting program, from previous geophysical work on the property (max-min II and magnetometer surveys) and from diamond drilling. It was designed to cover mainly the felsic volcanic units and their contacts with the overlying iron formation, tuffs and mafic volcanics and along the trend of the max-min anomalies located by Weaco.

A total of 200 samples of "B" horizon soils were collected over a two-day period Nov. 12th and 13th, 1999 by two men (Mr. Robert Etches and Mr. Lloyd Caswell). The samples were collected by cleaning off the A-horizon soil and using a shovel to collect the B-horizon soil in manila bags. The samples were sent to Swastika Laboratories for multi-element analyses. A complete set of assay results are attached at the end of this report. A map consisting of the following elements (Au, Ag, Cu, Pb, Zn) was drafted and is presented in the back pocket.

Survey Results

The results of the survey indicate that the background average for the plotted elements are approximately Au-5ppb, Ag-2ppm, Cu-8ppm, Pb-6ppm, Zn-15ppm.

The soil survey located on the north side of the grid was designed to cover an east-west

trending max-min II conductor with a coinciding magnetic anomaly. From drilling this anomaly yielded 20.6' feet of massive to semi-massive sulfides along with up to 0.09 ounces per ton gold over 5.5' within felsic volcanics. It was hoped that the survey would define an area along the conductor with a better mineral potential than another.

For the most part there appears to be only minor correlations to these conductors, e.g. L550E, 3+75N (Au-12 ppb, Cu-18 ppm, Zn-59 ppm), however the mag/max-min II anomaly is taken from the Weaco results on an imperial grid and compared to the present metric grid leaving room for a discrepancy. The best result that does not appear to be related to the contact zone was located at L250W, 4+50N where sample #9432 returned 12 ppb Au, 54 ppm Cu, 16 ppm Pb and 58 ppm Zn. This sample is near an outcrop of rhyolite. Further checking will be required in this area.

In the south part of the grid the survey covered an area of felsic volcanics in contact with iron formation and mafic volcanics. The background level appears to be lower than the north section with for example numerous assay results returning nil to 3 ppb Au. An easterly trending magnetic - max-min II anomaly had been drilled in 1986 (W-86-1) and intersected iron formation, diorite and sericitized quartz-eye rhyolite which contained fine disseminated pyrite and chalcopyrite. On L650E, 1+25S and approximately 75 meters to the east of the drill hole one soil sample, #14091, returned anomalous base metal values (Cu-24 ppm, Pb-26 ppm and Zn-164 ppm). This was also the best overall assay results from this survey for base metal mineralization.

CONCLUSIONS

The mapping and soil sampling program located numerous new target areas that will require further work.

It has been demonstrated that gold values exist on the property and that they are located within quartz veins with magnetite and pyrite in altered rhyolite breccia (to 1,539 ppb or 0.044 o.p.t. Au and in drill core 0.09 o.p.t. Au over 5.5') and in the massive sulfide intersections in the drill core (670ppb /5' in 100% sulfides, 840 ppb/2.5' in 30% sulfides, 680 ppb/6.3' in 100% sulfides).

From the log description the massive sulfide horizon may be more akin to a volcanogenic massive sulfide deposit than a sulfide facies iron formation.

The diamond drilling performed by Weaco Resources only tested a small portion of the mag/max-min II anomalies that are, in the north of the property, at least 5,600' (1,700 meters) long.

The drill core was not assayed for base metals. The highest gold assay was not located in the massive sulfide horizon and in fact was described as containing "finely disseminated magnetite in threads and stringers" and "1% disseminated pyrite."

RECOMMENDATIONS

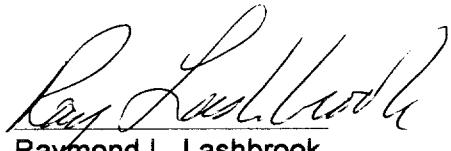

In light of the above positive conclusions regarding the property the following recommendations are made for further work on this property.

- (a) That the line cutting be extended further to the north and northwest to cover the extension of the anomalies in that direction and to the east to cover the extension in that direction.
- (b) That geophysical surveys consisting of mag and max-min II be performed over the whole of the property.
- (c) That the property be mapped in its entirety.
- (d) That a program of stripping, washing and sampling be undertaken to expose and sample the sulfide horizons.
- (e) That the diamond drill core of Weaco Resources be re-sampled and assayed for gold and base metals
- (f) Diamond drilling will be required to further explore the massive sulfide-gold potential of the property.

STATEMENT OF QUALIFICATIONS

I, Raymond L. Lashbrook, do hereby declare:

6. Instruction for cutting back credits that are not approved.

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- 3. Credits are to be cut back equally over all claims listed in this declaration; or
- 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.

Personal information collected on this form is obtained under the authority of subsection 6(1) of the Assessment Work Regulation 6/96. Under section 8 of the Mining Act, the information is a public record. This information will be used to review the assessment work and correspond with the mining land holder. Questions about this collection should be directed to the Chief Mining Recorder, Ministry of Northern Development and Mines, 6th Floor, 933 Ramsey Lake Road, Sudbury, Ontario, P3E 6B5.

Work Type	Units of Work	Cost Per Unit of work	Total Cost
Line Cutting	19.4 km.s.	\$270/km.	\$ 5,238.00
Geology	12 days	\$300/day	3,600.00
Soil Geochemistry	4 man days	\$150/day	600.00
Helper - Geology	8 days	\$120/day	960.00
Report & Drafting	8 days	\$300/day	2,400.00
			2.20484

Associated Costs (e.g. supplies, mobilization and demobilization).

ASSAY Costs - Rock & Soil Samples			4,171.61
Camp Supplies - (Propane, Gas, Oil, Naptha, mantles, rope, flagging, etc.)	RECEIVED		80.00
Sample Shipment	AUG 10 2000		33.06
Blue Prints Photocopying	GEOSCIENCE ASSESSMENT OFFICE		30.00
Transportation Costs			
Truck Mileage 2724 km.s.	0.30/km.		817.20
Food and Lodging Costs			
Food 3.2 man days	\$15/day		480.00
		Total Value of Assessment Work	18,409.87

Calculations of Filing Discounts:

1. Work filed within two years of performance is claimed at 100% of the above Total Value of Assessment Work.
2. If work is filed after two years and up to five years after performance, it can only be claimed at 50% of the Total Value of Assessment Work. If this situation applies to your claims, use the calculation below:

TOTAL VALUE OF ASSESSMENT WORK x 0.50 = Total \$ value of worked claimed.

Note:

- Work older than 5 years is not eligible for credit.
- A recorded holder may be required to verify expenditures claimed in this statement of costs within 45 days of a request for verification and/or correction/clarification. If verification and/or correction/clarification is not made, the Minister may reject all or part of the assessment work submitted.

Certification verifying costs:

I, Raymond Lashbrook, do hereby certify, that the amounts shown are as accurate as may reasonably be determined and the costs were incurred while conducting assessment work on the lands indicated on the accompanying Declaration of Work form as Recorded Holder I am authorized (recorded holder, agent, or state company position with signing authority) to make this certification.

Dear Sir or Madam:

Submission Number: 2.20484

Status

Subject: Transaction Number(s):

W0060.00327 Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice. Allowable changes to your credit distribution can be made by contacting the Geoscience Assessment Office within this 45 Day period, otherwise assessment credit will be cut back and distributed as outlined in Section #6 of the Declaration of Assessment work form.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact LUCILLE JEROME by e-mail at lucille.jerome@ndm.gov.on.ca or by telephone at (705) 670-5858.

Yours sincerely,

A handwritten signature in black ink that reads "Steven B. Beneteau".
