Introduction

This report describes a program of gold exploration from its inception in July 1994 up until August 1995. The work consisted of line cutting, induced polarization, magnetics, prospecting and trenching, geological mapping and diamond drilling. The geophysics has been described in two reports by Webster, one dated Jan. 1995 and a second Oct. 1995. The diamond drilling, is described in a report by Beecham May 1995. Except for minor modifications, this report is the same as a report submitted for the Ontario Mineral Incentive Program in January 1996. These differences are references to cost details which covered a different time period. As well, compared to the OMIP report, this report has bedrock assays certificates and soil geochemical laboratory reports appended.

The exploration is considered to be ongoing. Mapping of the whole property has not been completed and additional geophysics, geochemistry and trenching is planned. As well, only about the western 1/3 of the extent of the Tyrrell Structural Zone, the main gold bearing structure has been drill tested.

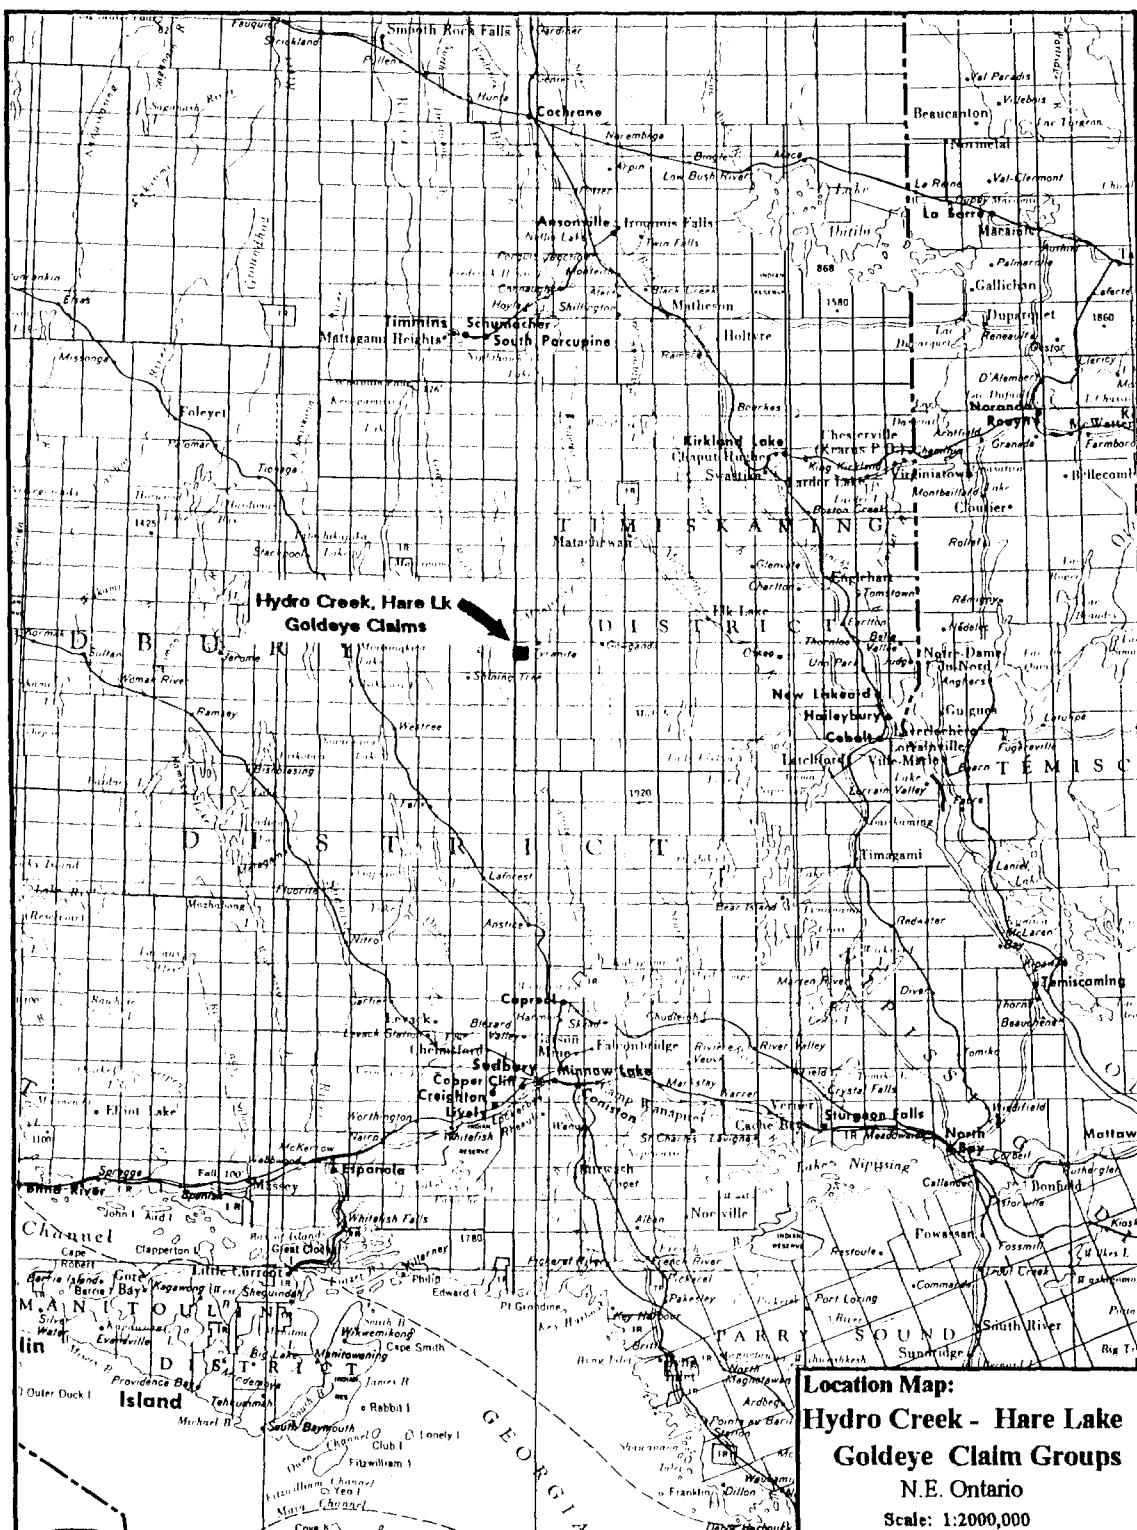

Location and Access

The properties are located in the NW part of Tyrrell Township and parts of the large Goldeye group extend into MacMurchy Township to the west and into Leonard Township to the south. However, the focus of this work is in NW Tyrrell. The work is centred at about latitude $47^{\circ}38' N$ and $81^{\circ}02' W$. The properties, lie on the south side of Highway 560 about 25 km. west of the village of Gowganda and an equal distance north east of the village of Shining Tree. There is very good access. On the west, an all weather forestry access road, starting on Highway 560, 1 km. east of the power line in northwest Tyrrell leads south along the west side of the Hydro Creek group and through the large Goldeye group. Two 'seasonal' roads lead eastward through the claims, one to Hare Lake and the other toward Athena Lake (See 1:20,000 Property Map). The Hare Lake group is accessible directly from Highway 560 at Porphyry Lake and a seasonal road west of Porphyry Lake leads south to the centre of this group. The east part of the Goldeye Group is accessible from the an all weather road that runs from at a point just east of the Tyranite road on Highway 560, southward to Indian Lake. A western branch of this road leads past Cond Lake to the area just east of Athena Lake.

Property Description

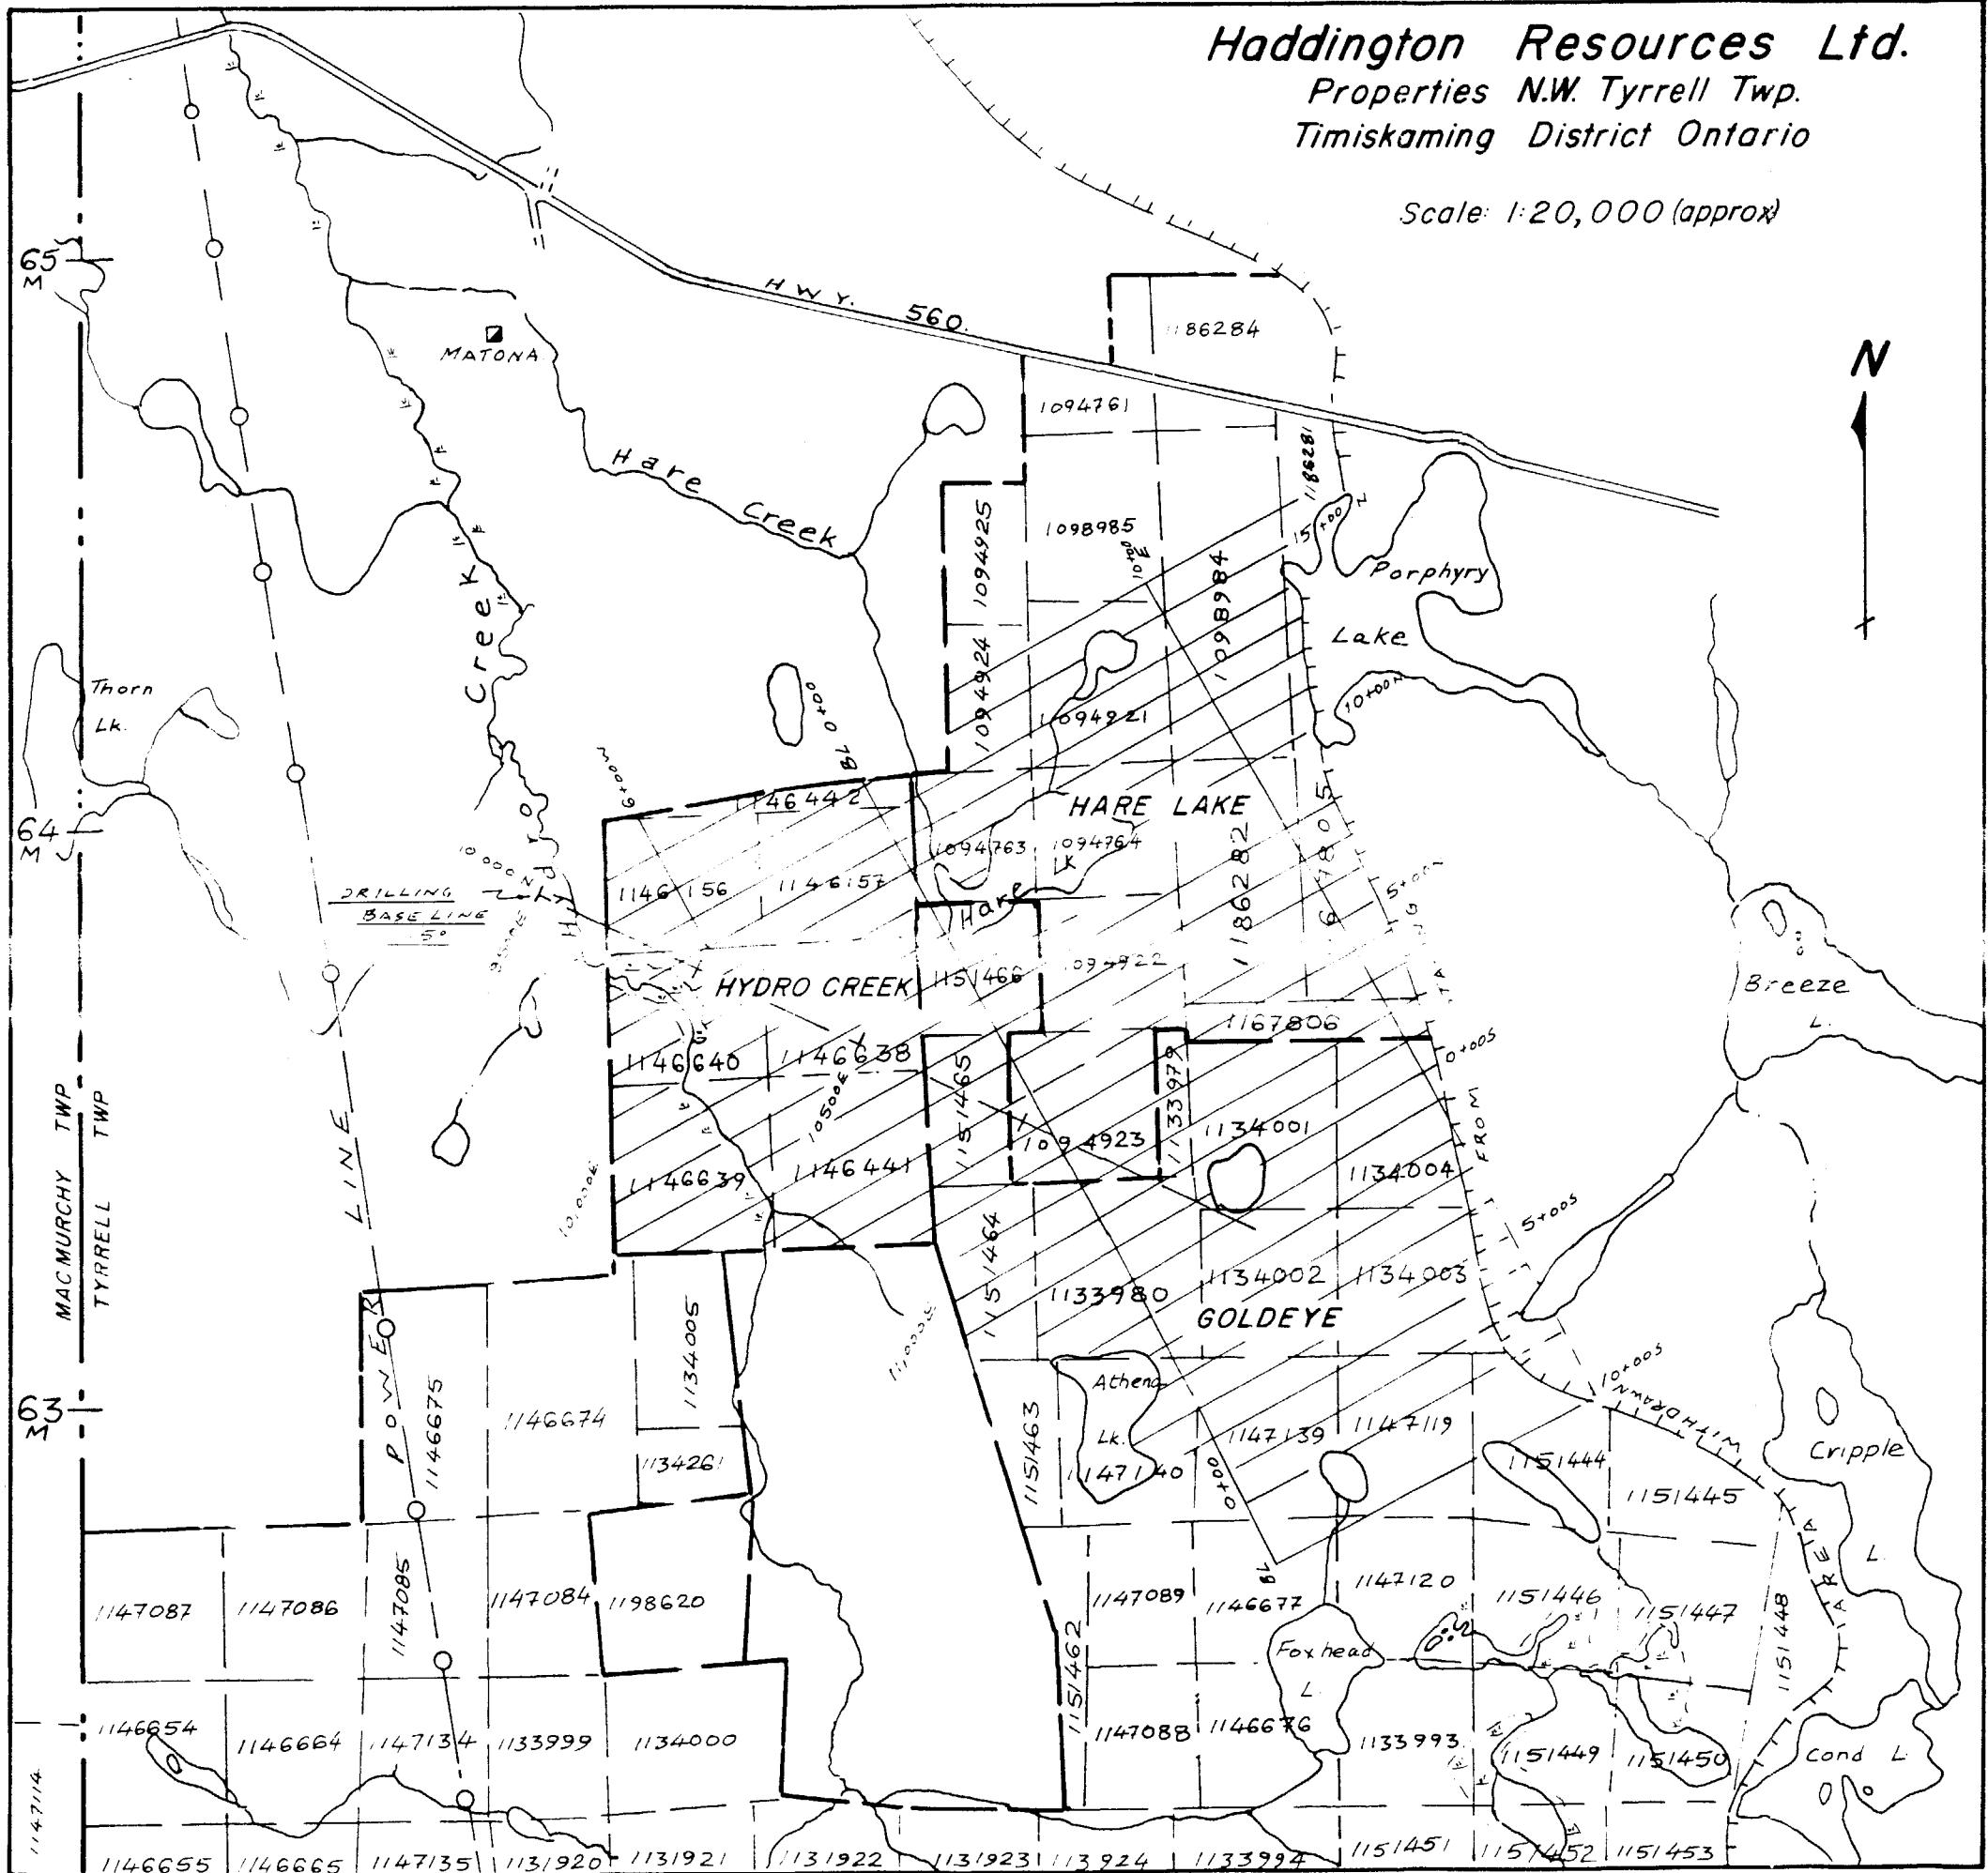

As noted above, the area being explored covers parts of three separate groups of claims representing three separate option agreements. All of these claims are controlled by option agreements between the claim owners and Haddington Resources Ltd. Portman Explorations Ltd. have earned a 50% interest in the properties by financing most of the diamond drilling and part the exploration work described here

All holdings are in the form of staked claims. These were staked at the time of the re-definition of the Land Caution in 1990 and thereafter. All of the claims covered by this work are single units. The three groups form one contiguous holding covering a large part of western and southwestern Tyrrell and extending into MacMurchy Township to the west and into Leonard to the south. On the east, the claims are bordered by the area of the Native Land Caution.

*Haddington Resources Ltd.
Properties N.W. Tyrrell Twp.
Timiskaming District Ontario*

Scale: 1:20,000 (approx)

Included in the holdings is one claim 1,198,620 on the west side of Hydro Creek which is recorded in the name of Haddington Resources Ltd.

A group of 6 claims, known as the Byberg Leases and which lie immediately south of the Hydro Creek Group, are surrounded by the holdings. These are not included in the holdings.

Hydro Creek Group:

This is a group of 7 claims straddling Hydro Creek. See Claim map. They were originally staked by A. LaCarte and R. MacCallum.

Hare Lake Group:

This group consists of 15 claims around Hare Lake and on the west side of Porphyry Lake. These claims were staked by A. LaCarte, R. MacCallum and R. Kamarechka.

Goldeye Group:

This large group of claims, 111 in all makes up the main part of holdings. These were originally staked for B. Webster and associates of Richmond Hill, Ontario and recorded in the name of Goldeye Explorations. Recent work has been done and future work is planned on only the 20 claims in the northeast part of this group, adjacent to the Hydro Creek and Hare Lake groups.

Previous Work

The following is a summary of the more important work done on the three properties. All of the assessment files in the general area were reviewed and compiled in the spring of 1994 prior to acquiring the claims. This summary is base on this compilation and other data available to the author. In the fall of 1994, Haddington Resources conducted a program of ground geophysics, soil geochemistry, mapping, prospecting, re-sampling of old trenches and some new stripping and trenching. The work consisted of 50 km of line-cutting, 45 km. of ground magnetics, 19.4 km of IP surveys, B-2 horizon soil geochemistry (391 samples), prospecting, geological mapping of a 1.7 by 0.8 km area and a small amount of backhoe trenching.

Hydro Creek Group:

Pre-1990	Old trenching, pitting by unknown prospectors in 2 areas, in west area NE. of Hydro Creek and at a site about 300m due west of Hare Lake;
1990-93	Prospecting, extensive power stripping, 3 diamond drill holes by LaCarte and MacCallum; Exposed favourable green carbonates and altered porphyries; Isolated values in trenches and drill holes; isolated coarse visible gold exposed in Main Lacarte Showing just west of Hare Lk.
Fall 1994	Haddington Res. covered 2/3 of claims with IP. and magnetic surveys, 1/3 covered with soil geochemistry; mapped and prospected about 2/3; Mapping located strong 115° shear zone and 2 new showings, one up to 2.59 g/t Au/ 4m located adjacent to shear in mineralized porphyries within green carbonates; Extensive IP anomalies some associated with the shear zone, and soil Au anomalies (Au anomalies of 50 to 130 ppb Au vs backgrounds of 1-3 ppb) found down ice from shear zone; Shear zone referred to as Tyrrell Structural Zone (TSZ)

Hare Lake Group:

Pre-1990	Old trenching of unknown age done south of Hare Lake and west of Porphyry Lake;
1959	Ranworth exploration drilled short holes, south of Porphyry Lake and south of east end of Hare Lake; no significant mineralization found;
1961	Sunbeam Expl.: geological mapping and magnetometer survey west of Porphyry Lake;
1977	Getty Mines: geological mapping, geochemistry done for base metals;
1990-93	Mapping, ground magnetics of west part of group, and power trenching south and NE of Hare Lake. Isolated gold values found on south side of Hare Lake , R. Komarechka and A. LaCarte;
Fall 1994	Haddington conducted magnetometer and IP surveys around and south of Hare Lake; IP anomalies located, but not evaluated; Some mapping and prospecting in area south of Hare Lake;

Goldeye Group:

- c1935 Pitting and trenching in 'shaft area' (E. side power line and 2 km. WSW of Athena Lk.) , See claim map;
- Pre 1948 'Holmes Deposit', 1.2 km. SSE of Thorn Lk. Resident geologist, Savage reports low gold and copper values found here presumably trenched and pitted;
- 1976 Getty Mines explored 6 claims for base metals in Notround Lake area, by mapping & soil geochemistry;
- 1991 BHP-Utah did large program geology, prospecting over most of large group; large areas covered with IP. and airborne magnetics and EM survey done; Resampled 'shaft area'; put down one drill hole east side power line SW of Byberg Leases; located minor Au values in old trenches, in outcrop mapping and drilling in general areas south and SW of Byberg leases; Concluded that property did not hold significant potential for a large economic gold deposit;
- Winter 1994 IP program by Goldeye (JVX) in area S. of Hare Lake, and east and SE of Athena Lake; Very strong spectral IP located in association with low gold values in area south of SW corner of Hare Lake; Other IP anomalies to south;
- Summer, Fall 1994 Haddington Res. explored NE part of claim group, south of Hare Lake and east of Athena Lake by IP. , magnetics; Soil geochemistry covered area south of Hare Lake and extended Hydro Creek work to SE. to edge of thick glacial overburden about 1 km. SE of Hare Lake; Mapping and prospecting covered same area as geochemistry and indicated that 115° trending shear zone mapped on Hydro Creek group extends ESE onto Goldeye Group; New showing with gold values in altered porphyry and iron formation found near SW corner of Hare Lk. Strong spectral IP in same general area trenched; Numerous IP anomalies traced southward from Hare Lake, also southeastward along prominent shear zone (TSZ) from Hydro Creek group; Soil geochemical anomalies (with anomalies up to 50 ppb Au vs background of 1 to 3 ppb) located south of (down ice from) 115° trending TSZ. and near SW corner Hare Lake;

Haddington Claim:(West side of Byberg Leases)

- c. 1935 Trenching and pitting some visible gold located with pyrite and chalcopyrite on west side of Hydro Creek; Work done by J. Wouk and by Erie Canadian Mines;
- 1981-83 Dome (Canada) Exploration; it is presumed that this claim covered by surface surveys in program on Byberg leases as this was then part of leases;

Regional Geology and Mineral Deposits

The geology of the Shining Tree and west Gowganda Area is described by Carter on maps 2365 (scale 1:31,680) with a regional view in map 2510 at a scale of 1:50,000. The general Shining Tree region is underlain by a sequence of Archean, mafic to felsic volcanic rocks. In western Tyrrell, according to Carter, the mafic volcanics strike NNW-SSE, they are steeply dipping, and are isoclinally folded. Westward in MacMurchy, strikes are more in an E-W direction. The volcanics are locally intruded by intermediate to felsic, sub volcanic intrusives and intermediate to granitic rocks such as at the Tyranite mine.

Most of the volcanics are classified by Carter as tholeiitic, calc-alkalic and komatiitic. Carter also classifies some of the volcanics in SE Natal Township and extending a short distance into the adjacent townships of Knight, MacMurchy and Tyrrell as mafic to intermediate alkalic volcanics. These are inferred to be generally younger than the other volcanics and are analogous to the "Timiskaming Group" of the Kirkland Lake area. Graham's older work show the Timiskaming to be much more extensive, including sediments and felsic volcanics in SE Tyrrell.

The folded volcanics are also intruded by the NNW trending Matachewan diabase dyke swarm. In the general region, the Archean rocks are unconformably overlain by the Proterozoic Gowganda Formation of the Huronian Supergroup. There are outliers of Gowganda Formation accompanied by sheets of Nipissing Diabase in the SW part of Tyrrell and NE MacMurchy Township and the eastern part of Tyrrell Township lies within the main Huronian basin.

There are a number of faults sets. The most prominent, a NNW set such as the Jess Lake fault in MacMurchy and the Hydro Creek fault in Tyrrell appear to be relatively late. Some faults of this set appear to have sinistral offsets and others appear to be dextral. A separate NW set (at a small angle to the NNW set) is represented by the Duncan Lake fault which shows significant down throw on the east side and marks the west edge the main Huronian basin. This may be part of the Temiskaming rift system. Less obvious 070° and EW trending faults are known to the west in the Ronda Mine area. There is, as well, a nearly NS set of fractures and faults which control a number of the known gold deposits and showings, as, for example, the main structures at the Tyranite and shear hosting the Ribble Vein at the Ronda deposit, the Gosselin zone at Shining Tree and the Dome Byberg zones at the project area. The 115° trending Tyrrell Structural Zone identified on the Hydro Creek and Goldeye properties has not (to the writer's knowledge) been previously described in the area. Although disrupted by younger structures, and hence made less conspicuous, this is thought to be a regional feature.

A WSW belt of granitic and sub volcanic, intermediate to felsic intrusives is apparent through the Milly Lake granodiorite at the Tyranite. This belt includes feldspar porphyries SW of the Tyranite, 'trachyte' intrusives at the Matona, a diorite stock northwest of Hare Lake, small feldspar porphyries SW of Hare Lake and on the Byberg Leases and small feldspar porphyries in NE MacMurchy Township. The western gold showings and deposits around the Ronda and in Asquith township lying 10 to 20 km. to the WSW appear to be more or less on this same broad trend. This trend is obvious on Carter's 1:50,000 compilation. The project area is centred within this belt.

There are numerous gold occurrences and showings in the general Shining Tree area. These can be roughly divided into two areas, (1) an eastern part encompassing SE, central and NW Tyrrell and extending northward into Knight and westward into the NE part of MacMurchy

Township, and (2) a western area covering the Ronda Area in SW MacMurchy and the area SE of the village of Shining Tree in Asquith Township. The project area lies within the eastern area. Of the showings in the eastern area only the Tyranite has been a producer. In the western area, the Ronda had a small production.

Surficial Geology

The surficial deposits of the area examined are best divided into two different 'domains'. Most of the west and a northwest parts are covered with variable, but relatively thin (generally not more than 3 or 4 m) of very sandy, low boulder and low cobble content deposits which are presumed to be mainly ablation till. Southeast of a line passing 450m east of Hare Lake and crossing the 152° base line at about 1+50N there is little outcrop and there appears to be a relatively thick blanket of surficial deposits. It is guessed that thicknesses of 10m and more are common. Most of this material, as exposed along logging roads in the south part of the grid, appears to be mainly sandy till and sand deposits. There are two or three kettle holes and kettle lakes within this thick blanket and in the extreme southeast of the grid there is a 20 to 30m high, discontinuous esker. The relatively thick blanket of cover appears to be the part of this esker system.

Geological Mapping and Prospecting

Mapping and prospecting was carried out during the fall of 1994, and parts of the spring and summer of 1995. This work was done mainly by the author. Control was from 100m spaced picket lines cut from the 152° base line. The area west, and southwest of Hare Lake was covered in the fall of 1994 and the general area east of Hare Lake was mapped in the spring and early summer of 1995. The mapping was not completed as planned. In particular, more mapping should be done as follows: (1) fill-in between the lines east of Hare Lake, (2) extension to the north end of the grid, (Line 16N) on the west side of Porphyry Lake, (3) the general area north of Hare Lake and (4) lines 5N to 1N eastward from the base line to the moraine and sand cover.

Outside the clear-cut areas, outcrop is covered with very thick moss and outcrop mapping required a lot of hand stripping. In the process of mapping, grab and chip samples of veins, mineralization and strongly altered rocks were taken. Assays of these are tabulated in Table II. For Sheet 1 and Sheet 3 areas, these data are shown on the geological maps. On Sheet 2, to avoid congestion, the assay data are shown on a separate drawing, Fig. 11. Summaries of significant trench and drill hole assays are also included on this sheet.

General Geology

Southwest of the Tyrrell Structural Zone (TSZ, also known as the Tyrrell Fault), roughly coincident with the drilling base line, the area is underlain by a sequence of bleached mafic flows.

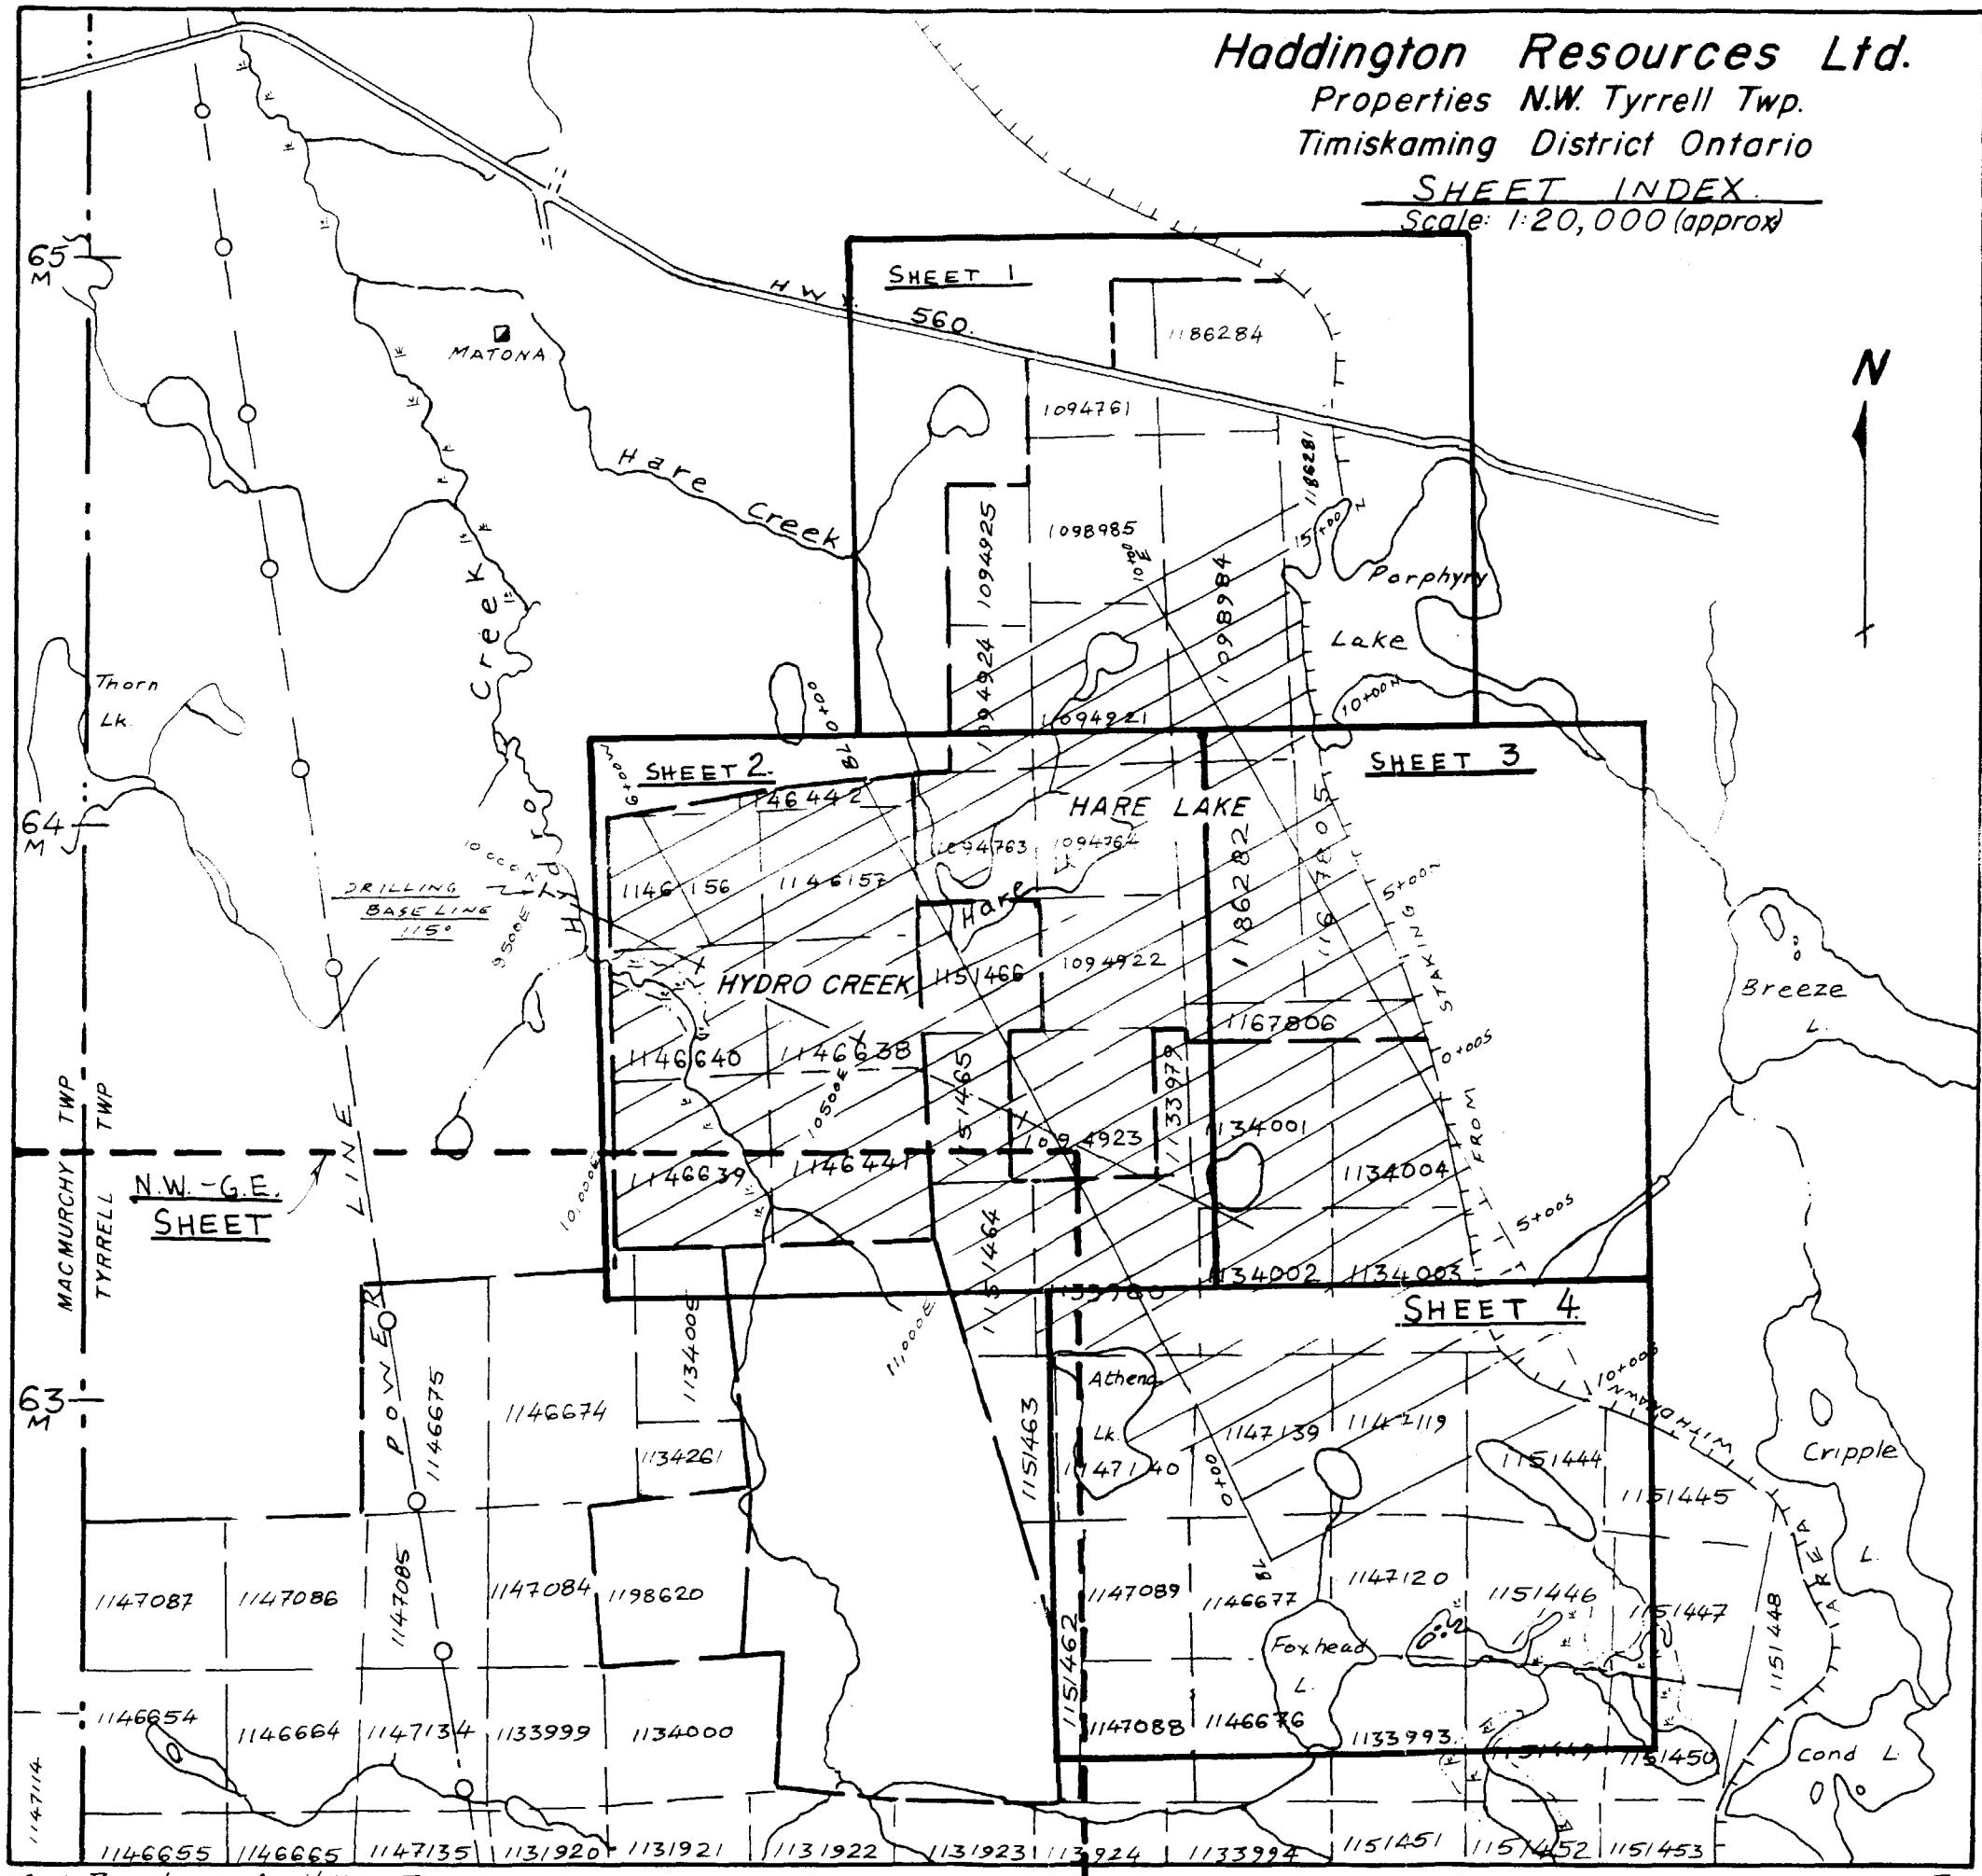

Haddington Resources Ltd.

Properties N.W. Tyrrell Twp.

Timiskaming District Ontario

SHEET INDEX

Scale: 1:20,000 (approx)

Many of these are well pillowled and tops are to the northeast. In contrast to the north side of the TSZ where adjacent rocks strike parallel to the structure at about 115° , these flows are clearly truncated by the TSZ and strike 170° to 140° . In drill holes, narrow crystal tuffs within these mafic flows dip SW. Hence the sequence is overturned.

North of the TSZ a sequence of (1) green carbonate rocks with spinifex-textured komatiitic volcanic remnants, followed to the north by (2)quartz-feldspar crystal and lithic tuff and (3) massive dacitic tuffs (or "trachytes" as they are locally known) has been mapped. Up to 50m of thinly interbedded siltstones, feldspathic quartzites and argillites occur in the northwest area at the green carbonate - trachyte contact. These were recognized as turbidites by H. Lovell, previously resident geologist in Kirkland Lake. In the NW area, the (1) to (3) sequence is duplicated by a steeply south dipping fault that splays from the Tyrrell Structural Zone at DH Section 10600E. Drilling data indicates that the strata northeast of the TSZ also dips southwest. Their top direction has not been recognized. This sequence along the NE side of the TSZ is referred to here as the TSZ footwall sequence. A complication of this simple footwall sequence is that the quartz-feldspar crystal and lithic tuffs similar to unit (2) occupy most of the low ground in the SE drilled portion of the TSZ. These rocks do not outcrop and are only known from drilling. They could be either a folded duplication of unit (2) or a separate felsic unit lying south of the green carbonates-komatiites.

A few thin, massive, quartz feldspar porphyritic rocks occur within the TSZ footwall sequence. These strike about east west and trend 'into' the TSZ from the north side. They are thought to be intrusives.

The area south, east and northeast of Hare Lake is underlain by a mainly felsic to intermediate volcanics probably including both pyroclastics and flows. There are subordinate amounts of massive gabbro to diabase textured mafic volcanics or sills and one or two, thin ultramafic units mainly massive serpentinite. It is not apparent whether these ultramafics are flows or intrusives. Most of these Hare Lake felsics strike nearly north-south. In spite of fairly detailed mapping around the SW corner of Hare Lake, no reasonable structural interpretation connecting these rocks to the TSZ footwall sequence has been worked out.

Feldspar porphyries are exposed mainly around the SW corner of Hare Lake. At the Lacarte Main Showing a dome-like structure of massive to brecciated porphyry has been mapped. Thin tuff breccia with clasts texturally the same as the 'dome' are exposed at the north end of the stripped area and although somewhat obscured by chlorite alteration, it appears that small feldspar porphyry dykes lead off the main mass to the NE and may be feeders for these tuffs.

Other, texturally different feldspar porphyries (or less altered) occur 200 to 400m to the east in the GE #1 and #2 trenches. Whether or not these occurrences are extensions of the Lacarte Main Showing porphyries around a small synclinal fold is not certain.

Distinctive, brown-weathering hornblende porphyritic diorite (to gabbro) is exposed northeast of the Hare Lake Road from its intersection with the Hydro Creek road for some 500m toward Hare Lake. Other exposures occur several hundred metres north of the property along the Hydro Creek Road. Dykes of similar material are exposed at the Lacarte Main Showing, at the GE #2 and #1 Trenches and in a trench farther to the east at L9N/4+50E. The main mass contains numerous, small mafic inclusions and clusters of hornblende phenocrysts. The ground magnetics suggests that the exposures north of the Lacarte road are part of larger, stock-like

intrusive which also occupies the northwest part of Hare Lake. These diorites weather the same and seem to grade into the dacite tuff ("trachyte") unit. The dacite tuffs may be thick ash beds derived from this intrusive. Except that they appear more mafic where exposed on the Lacarte claims, these diorites are identical to parts of the Milly Lake intrusive at the Tyrannite mine.

The distinctive colour, the lack of deformation suggests that the diorite and "trachyte" may be part of a 'late' alkalic suite described by Carter.

Numerous late diabase dykes cut all the volcanic rocks. Most of these trend north to slightly west of north. In drilling it was noted that most of these north trending dykes are feldspar porphyritic. These porphyritic dykes are recognized as the Matachewan swarm. Other non-porphyritic diabases intrude along the TSZ and the splay fault from this structure. These are cut by and are therefore older than the porphyritic type. Both sets of diabases are magnetic and a lot of their interpretation shown in Fig. 5 is based on magnetics.

Structural Geology Observations

A small synclinal fold is apparent at the SW corner of Hare Lake. At the Lacarte Main Showing, feldspar porphyries are followed to the northeast by thin beds of iron formation and argillites and siltstone-feldspathic quartzites. A similar sequence is exposed in the GE #1 #2 trenches, but in the reverse order.

The reader is referred to the diamond drilling report (Beecham May 1995) for a description of the Tyrrell Structural Zone. Two other parallel structures are noted to the north of the TSZ. The first of these is marked by a topographic depression extending ESE from the SE 'corner' of Hare Lake. Outcrop here is too poor to be certain if there is much interruption in the volcanics. A second feature is marked by a swamp at the north end of the grid, picket lines 15N and 16N, Fig. 4. This feature can be traced ESE through Porphyry and Breeze Lake for more than 2 km. and is referred to as the Breeze Lake Shear. No exploration has been conducted to evaluate this feature on the property.

Four 020° trending relatively late faults were mapped. The first of these passes just west of the gate on the Hare Lake road. It forms a prominent draw in the diorite stock but it is not easily recognized to the south in the volcanics. The second of these is the '10400E' structure that passes west of Lacarte's cabin. This contains significant gold values as is noted below in 'Soil Geochemistry'. A third passes close to the GE #1 and #2 trenches and interrupts the TSZ footwall sequence at about 6+50N. A fourth such structure extends southward from the east end of Hare Lake. This feature trends almost north-south and may be a different fault set. Of significance is that it seems to disrupt the TSZ on the Goldeye property in the area of base line and 1+00N. The hangingwall diabase sill of the TSZ can be traced to this point by ground magnetics. East of this north-south fault, the ground magnetics become confused and the position of the TSZ is uncertain. It is presumed that the TSZ is offset by the fault.

Soil Geochemistry Hydro Creek-Hare Lake Goldeye Areas

Samples of B-2 horizon soils were collected using picket lines for control. Some sampling was done between lines using a 'hip chain' and compass. On the Hydro Creek, Hare Lake and Goldeye properties most of the sampling was done at 25m spacing and 100m spaced lines.

The results of the Hydro Creek-Hare Lake-Goldeye sampling are shown on three, 1:2000 scale sheets, Fig. 7, 8 and 9. Anomalous areas are described below, identified by their approximate picket line coordinates (from the 152° base line.)

A large part of the results were available before the 1995 winter diamond drilling program was planned and these data played a significant role in the recognition of the auriferous Tyrrell Structural Zone which was the main target of the drilling.

The better soil anomalies were prospected and, a few as described below, were investigated by back hoe stripping. The two most prominent anomalies were tested by diamond drilling as described in a separate report, Beecham, May 1995.

Anomaly 13N/TL6+00W

There are a number of anomalous soils scattered over an area about 300m by 300m from L12N to L15N. Maximum levels are 25 ppb Au. These anomalies seem to reflect glacial dispersion from possibly eastern extensions of the Road Vein mineralization and anomalous bedrock gold in tuffs and sediments at the north contact of the green carbonate rocks such as that exposed in pits at 14+50N/4+50W.

Anomaly L12N/6+75W

There is a very strong anomaly, 7485 ppb Au located in the gossan at the east end of the Otter Showing. The anomaly extends southeast about 50m suggesting some continuity to the bedrock mineralization. Although the geochemical anomaly is well explained, further stripping of the anomaly to east would provide some useful data on the nature of the gold values in what is potentially a low grade ore zone.

Anomaly 11N/8W

This anomaly lies down ice from the untested part of the TSZ west of drill hole HC -01. It consists of 2 N-S elongated parts separated by a swampy area (with no samples). The overall across ice width of the two anomalies is about 200m and could conceivably indicate gold mineralization of the same length in the TSZ, (which lies immediately up-ice). This part of the TSZ lies under Hydro Creek and would have to be tested by diamond drilling. The holes would have to be collared on open grassy swamp which would only be accessible in the winter.

Anomaly 9N/ 4+00W - 10N/3+25W

This anomaly is outlined on 50m spaced lines. The anomalous soils coincide more or less with the 020° trending valley located just west of Lacarte's cabin. The anomalies occur both on the bottom and on the west slope of the valley and do not appear to be drainage related. The one

drill hole, HC 04 that tested this valley (See Fig. 11) cut a gouge filled fault and a vein-alteration zone with low gold values, up to 0.69 g/t. This structure has been referred to as the 10400E zone, the drill grid line with which it coincides. Although trenching was planned for this anomaly, it was not completed. Judging from experience elsewhere on the property, the soil anomaly seems too strong to be caused by the minor values in the drill hole. Hence there may be better values either north or south of the drill hole. To the north where the 10400E structure projects into the diorite stock, there is a setting similar to that at the Tyranite deposit. Although speculative, one possibility is that these strong soil anomalies mark a till streak originating farther north from such a source.

Anomaly 2N/2+50W - 8N/4+50W

This large anomaly extends in a west-northwest direction for between the indicated points for a distance of about 600m. Originally sampled in 1994, the anomaly was further defined by 'across line' sampling in the 1995 field season. Contouring of the data suggests a north-south 'grain'. The anomaly extends southward, down-ice as far as sampling has been done. To the north it stops abruptly at a prominent 115° trending depression, now known to mark a significant gold bearing structure, the Tyrrell Structural Zone. A till streak originating in this structure is the obvious source of the gold in the soil.

Anomaly 13N/5E (North of Hare Lake)

The area was sampled to check an IP. chargability anomaly. Scattered, small anomalies suggest a gold source here or up ice. More work, mapping, prospecting and stripping is obviously warranted.

Anomaly L8N/1+50E

The source of this anomaly, although probably the Goldeye #1 and #2 trench mineralization, is uncertain. The anomaly terminates to the north and does not extend 'up to' the mineralized iron formation. Several metres of glacial-fluvial gravels and sand lie under the anomaly on L8N and there is some doubt as to whether or not it originated in the exposed mineralization. The anomaly itself does not warrant any more follow-up.

Anomalies L8N/4+25E to L6+50N/6+75E

A series of isolated highs here are aligned roughly east west. Gold levels here range up to 65 and 150 ppb. There is no obvious source for these anomalies. They could possibly mark small till streaks originating in an east-west shear zone postulated through Hare Lake. It is noted that the Blow Down Showing at 7+10N/8+60E, lies along the north side of the postulated shear.

Soil Geochemistry NW Goldeye Area

After the autumn of 1994 mapping, it was recognized that the main gold bearing structure on the Hydro Creek and Goldeye properties, the Tyrrell Structural Zone terminated to the west at the Hydro Creek. It appeared to be offset by late fault sets along the prominent Hydro Creek lineaments. Farther west in MacMurchy and Churchill Townships, the late regional NNW trending Jess Lake and Michiwakenda Lake faults have large left hand off-sets. It was guessed that the Hydro Creek faults would also have left-hand offsets. Hence, a likely location of the TSZ west of the Hydro Creek would be the NW Goldeye claims. A number of topographic lineaments were in fact recognized on airphotographs in this area. A reconnaissance soil geochemical survey was laid out to search for gold related to these possible offsets of the TSZ. Later mapping, however, indicates that the faults along the Hydro Creek almost certainly have a right hand offset.

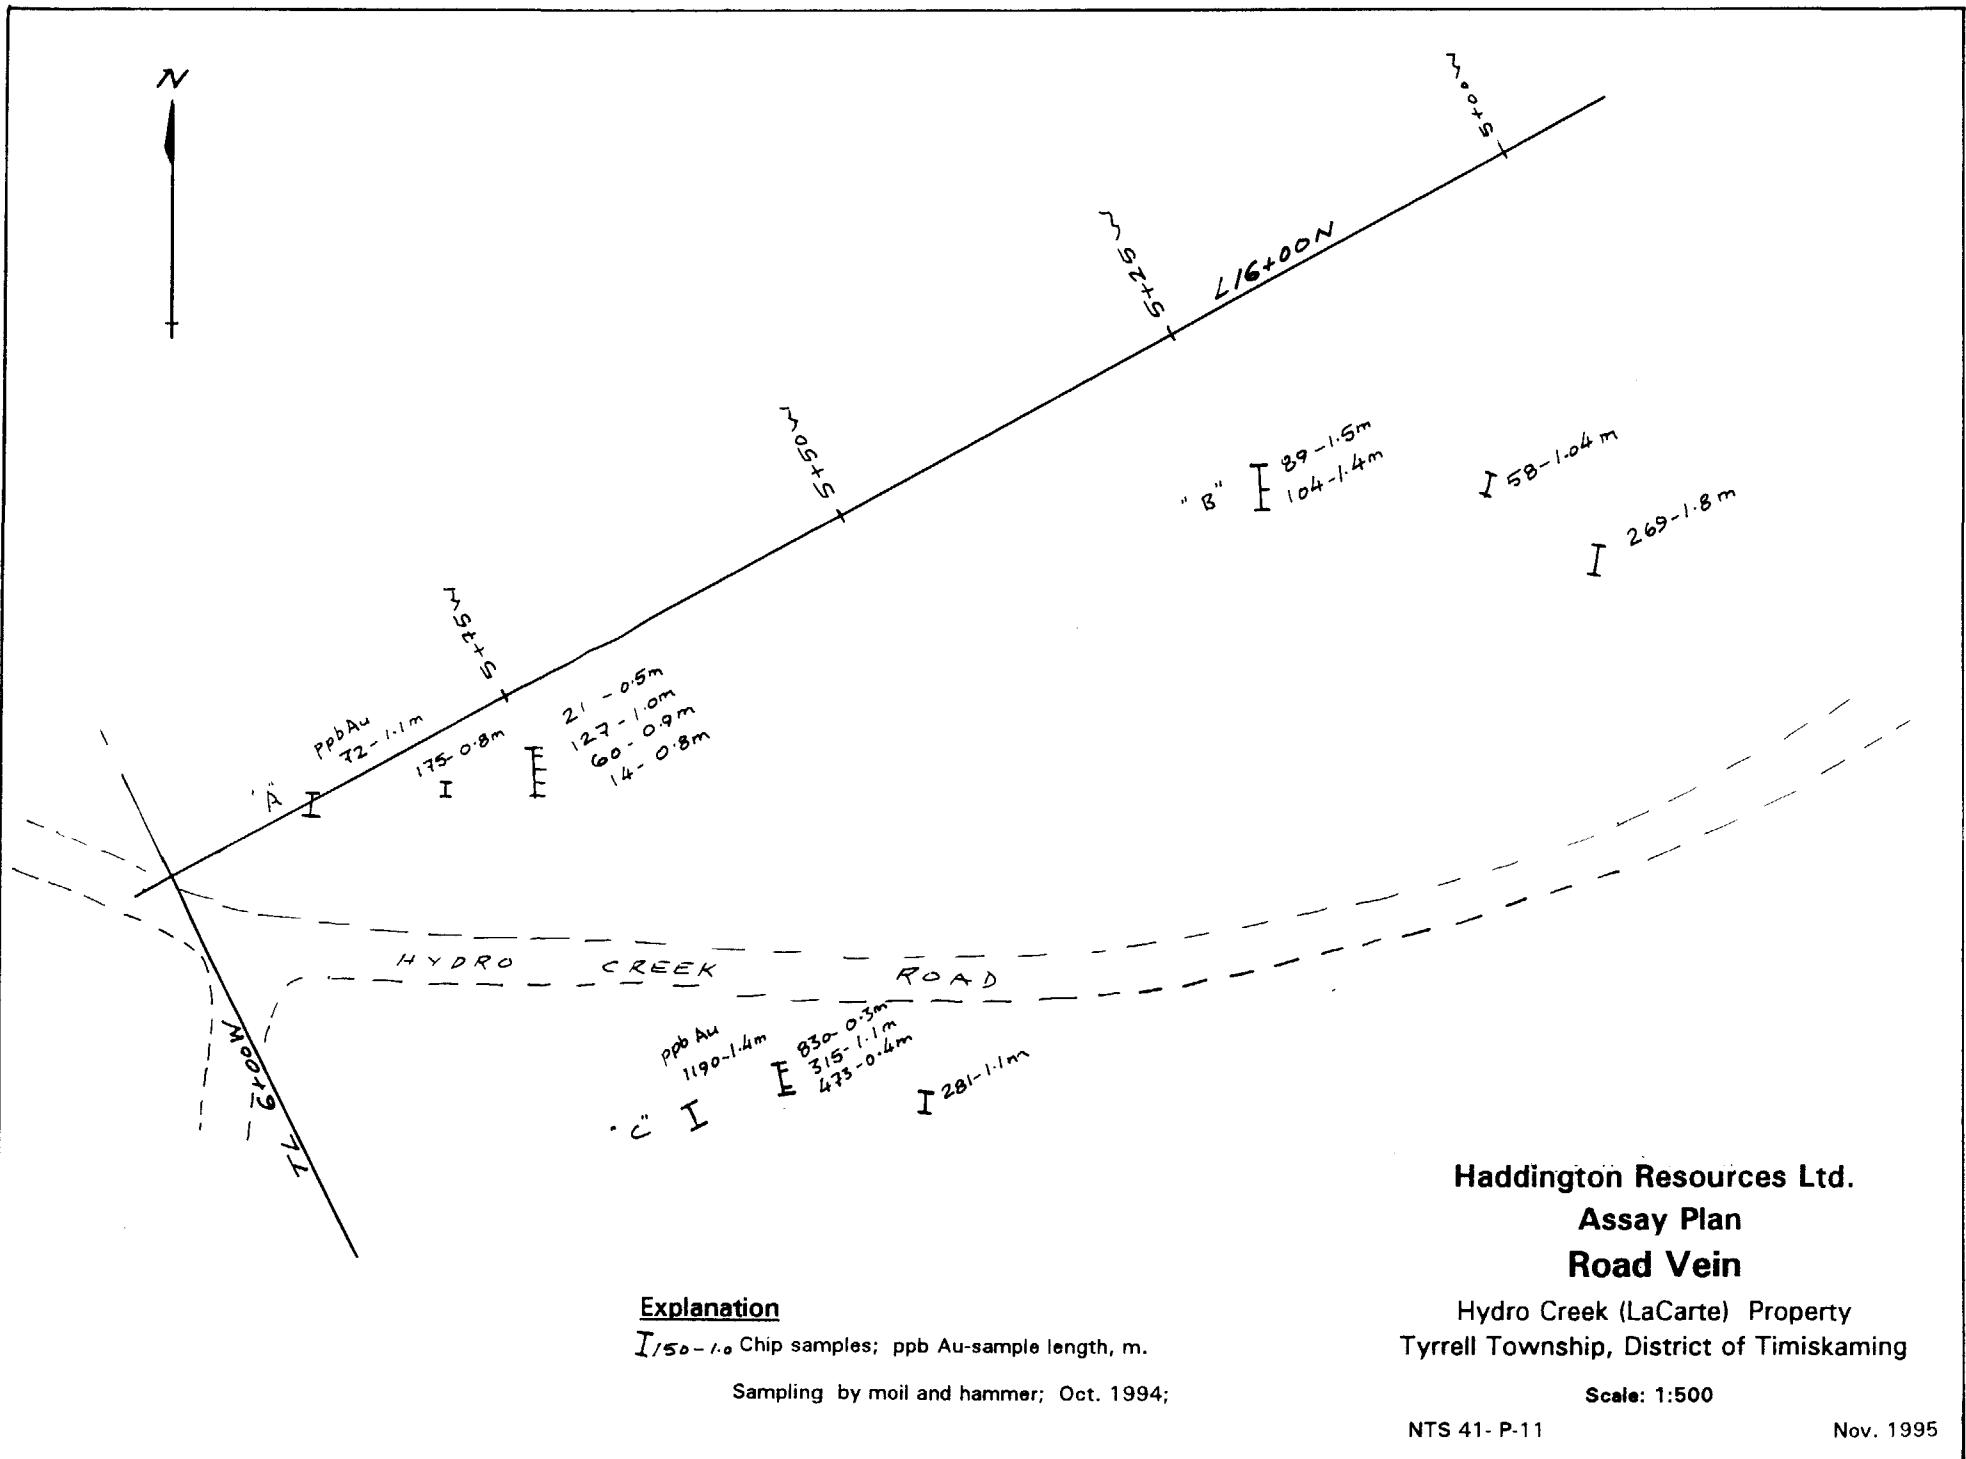

Sampling was done on lines re-cut in 1994 and a few km. of new lines put in by the sampling crew in 1995. The picket lines are oriented east west on 200m spacings. The sample interval on the lines was 25m. Results are shown in Fig. 10 at a scale of 1:5000. B-2 soils sampling covered an area about 1.6 km from north to south by 2 km from east to west. Results are shown in Fig. 10. Scattered isolated anomalies with levels of 25 ppb Au and even up to 50 ppb occur here and there over much of the grid. The source of these, mostly one-point anomalies is uncertain. Two of the anomalies as noted below may be significant.

Anomaly L98N/14+50E: This is an isolated anomaly of 6000 ppb. The point was re-sampled and produced an anomaly of 800ppb Au. Till from the sample point was panned. No gold was found and the heavy fraction assayed only 369 ppb, while hand picked quartz fragment from the till assayed 721 ppb Au. The area was not examined by the author, but it was mapped by BHP, see Hill. He shows a 020° trending linear depression about 100m west of the sample point. Some gold values (1.42 g/t over 0.75m) are noted in quartz veins along this lineament about 135m WSW of the sample. It is possible that the soil gold could mark a till streak originating farther north in this 020° structure. There are also other bedrock gold occurrences in the area; a pyritic silicified shear 50m SSW of the soil anomaly assayed 2800 ppb Au and it is possible that the soil anomaly is related to a nearby bedrock source. Detailed mapping and prospecting around the site is recommended as a next step.

Anomaly L94/117+75E: This 2-line anomaly occurs in an area of Huronian cover rocks. It probably reflects a till streak originating farther north, possibly from mineralization exposed in several old showings on claim 1198620, that used to form part of the Byberg Leases. However, gold bearing veins are known to occur even within Huronian rocks and the anomaly might mark in situ gold. This claim should be mapped and soil sampled on 100m spaced lines.

Trenching and Bedrock Sampling

The Road Vein: The Road Vein, which is exposed in some of LaCarte and MacCallum's extensive backhoe stripping, was mapped at 1:2000 during the fall of 1994. It was sampled at wide spacing (6m) by moil and hammer. See Fig. 12. As only low gold values (the best being 1.19 g/t Au over 1.4m) were returned, no detailed mapping was done. These large quartz veins have almost no sulphides and as at the Otter Showing, contain only low gold values.

Otter Showing: The Otter Showing was located while mapping along Hydro Creek in the fall of 1994.. See Fig. 13. Although this showing lies right on the bank of the swamp it had apparently not been sampled previously. Four shallow trenches were put in by hand and sampled with moil and hammer. The showing lies within what is now recognized as the Tyrrell Structural Zone. It consists of concentrations of 3 to 5% fine pyrite in altered (silicification, carbonate, sericite) quartz porphyry and quartz veins within green carbonate rocks. Gold values, up to 2.59 g/t Au over 4m, m. are associated with the pyrite concentrations. There are no values in the quartz veins.

L12 N/2+75 W Occurrence: This consists of an area of old trenching located on the south side of the Hare Lake road and about 350m west of Hare Lake. There is considerable red alteration, some sericite and pyrite concentrations and several feldspar porphyry and other intermediate dykes cut the host rock, dacite tuffs. The only sample taken, a chip sample across 1 m, from a 1 to 2 metre wide quartz vein assayed 0.93 g/t Au. The isolated nature of the soil response in this area suggests the mineralization is quite small.

Lacarte Main Showing: This is one of the areas of extensive backhoe trenching by LaCarte and MacCallum. It was mapped at 1:500 except for the long south trench which was mapped at 1:2000 and enlarged to 1:500. Numerous grab samples were taken, but because of the generally low gold values, no systematic channelling was done. Geology and assays are shown in Fig. 14.

The occurrences of visible gold in this showing are all from one rock trench. The gold occurs in a stack of thin, nearly flat quartz veinlets with a 1 to 5 cm. altered pyritic selvage. The veinlets are separated by relatively unaltered, unmineralized feldspar porphyry. It is believed the visible gold was restricted to an area 1 or 2 metres square. Several of the pyritic selvages were sampled. However, the best value obtained was 742 ppb Au. No gold was exposed when the showing was mapped, hence no high grade assays, as reported by Lacarte, were obtained. It is very difficult to determine the amount of gold removed from this pit and make an estimate of the grade. This would likely require a bulk sample

An area of porphyry about 30m NE-SW by 15m NW to SE immediately SE of the "gold pit", is strongly mineralized with stringers and disseminations of pyrite. (A much larger area has weak pyrite mineralization.) This pyrite reaches the highest concentration, some 15 to 20 %, on the east side of the exposure at the east contact with the pyritic argillites and other fine sediments. This appears similar to hydrothermal vents marked by stringer zones under the massive sulphide lens in VMS deposits. The build-up of the pyrite content in the porphyry suggests that the stratigraphic top of system is to the NE and that the pyritic sediments are a type of exhalite overlying the feldspar porphyry dome. This implies that the tops of the volcanics here face NE. There is no significant concentration of base metals exposed, nor does the stringer and disseminated pyrite present carry any gold.

At 10+15N/1.28W in the large south trench, chip samples of a 0.3m quartz vein with magnetite, pyrite and chalcopyrite assayed 2500 ppb Au. Within the felsic tuffs exposed at the northeast part of the main exposure (20m south of L11N/0+43W), chip samples of a cluster of narrow, white quartz veins assayed 4526 ppb. This assays was not verified by re-sampling. The veins do not seem to have much tonnage potential. However, they could easily be stripped westward.

A low gold value, 979 ppb was returned from a sample of a flat, pyritic quartz vein in a small pit southeast of the main trenches, at 9+75N/0+75W.

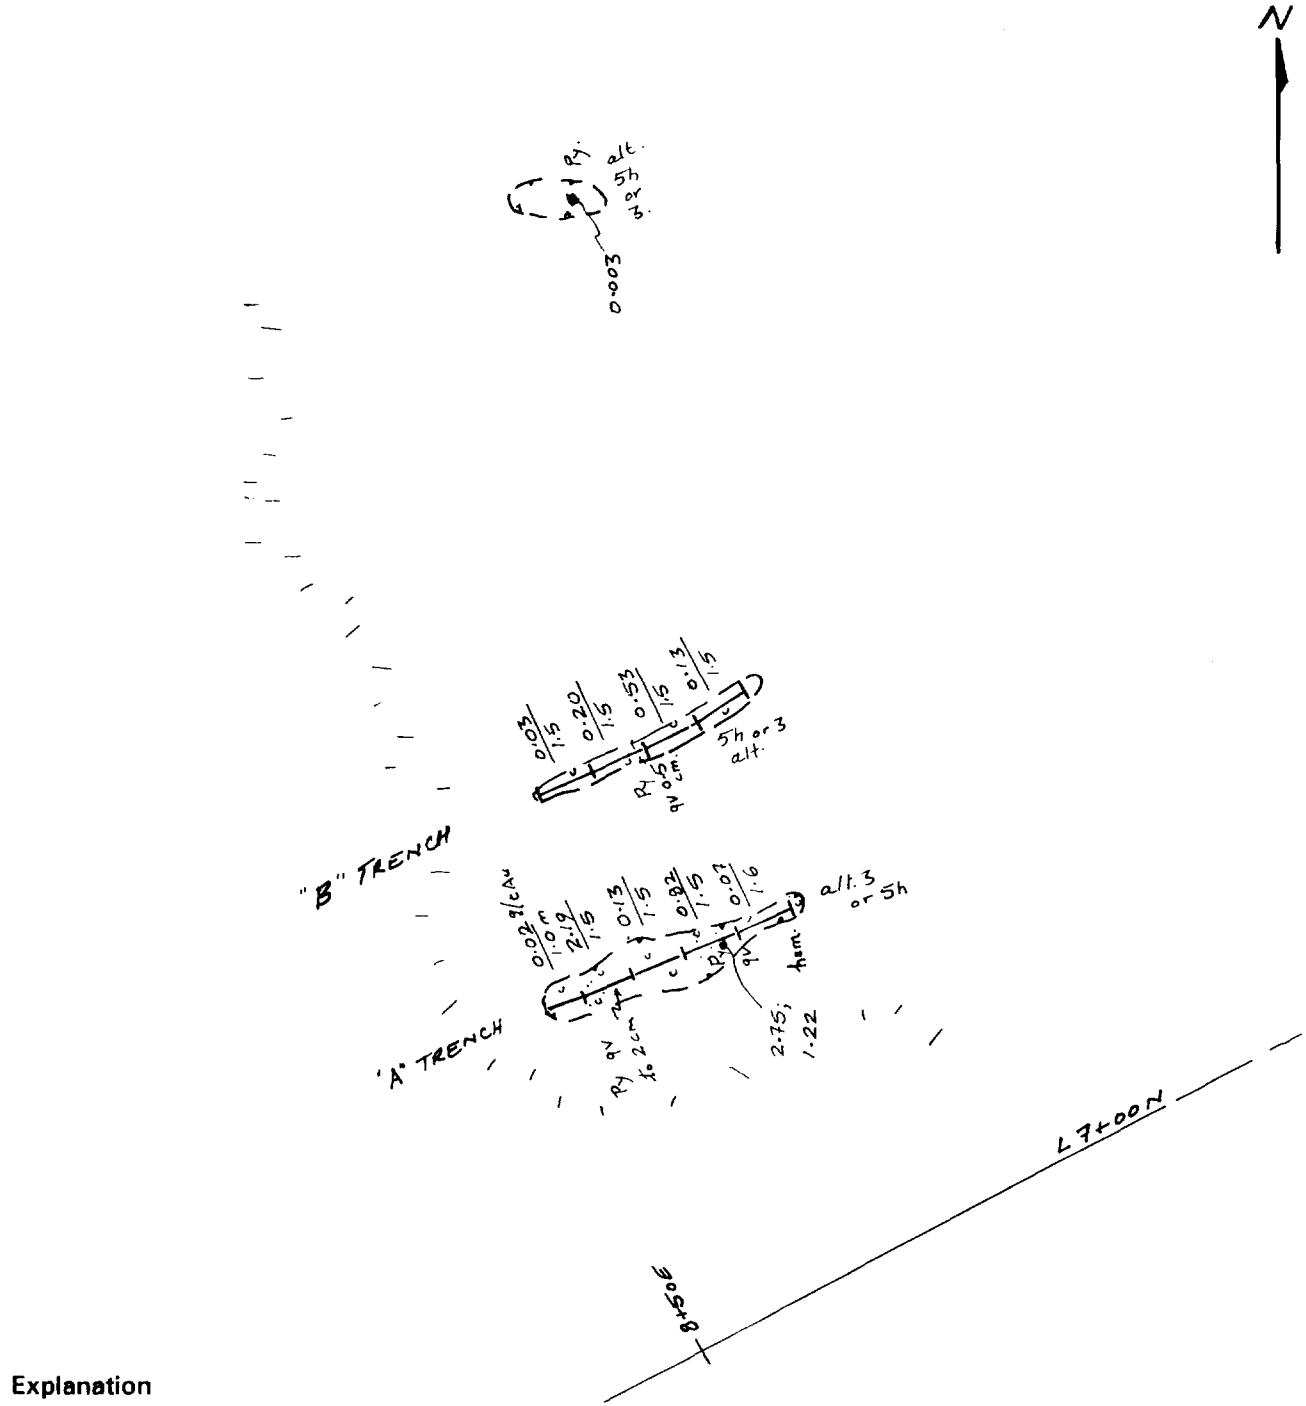

Goldeye #1 Trench: The Goldeye #1 and #2 Trenches are located south of the SW corner of Hare Lake. The #1 Trench was partly excavated in the fall of 1994 to explore an IP anomaly and coincident soil gold anomalies. It was further excavated and washed, and sampled with a rock saw in the summer of 1995. It appears to be part of a more extensive auriferous fracture zone that probably extends from old trenches at about L7N/0+50W to Goldeye #2 Trench, a distance of about 350m. At the #1 Trench, at the site of an old, cobbled trench, a north-south vein is developed in fine sediments near their eastern contact with massive, unaltered feldspar porphyry. The vein consists of 0.2m of quartz-carbonate with fine pyrite and narrow quartz veinlets at the north side of the trench and thin quartz veins with pyrite over about 2m at the south side. The best assay here is 0.685 g/t Au over 0.8m. The IP anomaly that the trench was dug to explore probably is caused by the wide zone of pyritic and graphitic sediments lying west of the vein.

Goldeye #2 Trench: This area was stripped with a back hoe in the summer of 1995, and sampled by rock saw. This was to follow-up values found in prospecting in the fall of 1994 and in drilling in the winter of 1995. A NE striking, 3 m thick unit of altered, contorted, magnetite iron formation and other fine sediments are cut and dilated by a 25m thick NE striking diorite dyke. Both iron formation and diorite are cut by altered feldspar porphyry. Good gold values, see Fig. 16 occur discontinuously in the iron formation and low gold values are present in the thin altered pyritized feldspar porphyry dykes. The best values occur where the iron formation is pyritized and cut by thin, white quartz veinlets. On the north side of the exposure, one section assayed 6.96 g/t Au over 3.3m. Unfortunately the pyritic zone here is only about 7m long. The narrow white quartz veins with which the gold is associated are developed only in the, presumably brittle, iron formation and do not extend into the adjacent sediments or diorite. Sizable shoots might be developed in this area if larger volumes of favourable iron formation could be located. In this regard, a very detailed (say a 10x5m grid) magnetic survey of the surrounding area might be useful. Much of the area to be covered is open swamp and part of Hare Lake and could be quickly done from the ice.

Blow-Down Showing: This isolated showing was located some 325 ESE of Hare Lake during mapping and prospecting. Highly carbonatized intermediate to felsic rocks are poorly exposed in an area of outcrop about 30 by 40m. The area is covered with thick scrub growth and blown down trees. The only gold values found are located at the SW part of the area, associated with thin quartz veinlets and a few percent disseminated pyrite. Two shallow trenches were excavated by hand and chip sampled. The best assays were 2.75 g/t Au in a grab sample and 2.19 g/t Au over 1.5m in a chip sample. Soil geochemical lines run over the showing, 50m north and 50m south did not find any associated soil response. However, on the northern line the area adjacent to the showing could not be sampled because of swamp. The occurrence lies at about the intersection of an east-west and a north south lineament. It is recommended that the small outcrop area be stripped with a light backhoe and sampled.

Miscellaneous Bedrock Gold Anomalies: As well as the areas of systematic sampling described above under various showing names, there are a number of areas where grab and chip samples returned anomalous levels of gold. See Table II and Fig. 4, Fig. 3 and Fig. 11. These are described below:

(1) 14+50N/4+50W: Concentrations of gold occurs here in quartz veins and mineralized argillite and quartz crystal tuff, near the north contact of the green carbonate rocks. This is an area of pitting and trenching by Lacarte and MacCallum. Samples assayed up to 425 ppb Au. As noted

NTS 41- P-11

Jan. 1999

Sampled July 1995

in 'Soil Geochemistry' , there appears to be a minor concentration of gold here, but the does not warrant a high priority for follow-up work.

(2) 13+70N/6+30W: A sample from a narrow, pyritic (+/-graphitic) argillite at the north contact of the green carbonate assayed 2.61 g/t Au. This is in a large area of stripping by Lacarte and MacCallum. This is a very thin unit and it does not seem to have much size potential.

(3) 7+70N/3+00W: Here a chip sample of quartz veins with pyrite and a little chalcopyrite in an altered quartz porphyry assayed 758 ppb Au. This area should be stripped, mapped and systematically sampled. It is one of a very few exposures of the mineralization along the TSZ (it lies in the immediate footwall of the zone) and it is important to document the nature of the mineralization in this potential ore zone.

(4) 9+95N/2+30W: Pyritic altered quartz veined "trachyte" here assayed up to 645 ppb Au. This more less along the 10400E structure. This area warrants stripping in the process of investigating the strong soil anomaly in this area.

(5) 6+10N/1+45E: Here an isolated anomalous bedrock sample (357 ppb Au) comes from altered, pyritic dacite tuff ("trachyte"). No controlling structure is recognized here. Although the soil response is negative the immediate down ice area is obscured by swamp. More detailed prospecting and hand stripping is recommended, followed possibly by mechanical stripping.

Conclusions and Recommendations

The program of mapping, prospecting soil geochemistry, power stripping and diamond drilling has identified four high priority targets. The most important of these is the mineralization along the Tyrrell Structural Zone. Details of recommendation for follow-up drilling on this zone has been made in the drilling report of May 1995 and later detailed proposals. As well as this follow-up drilling some effort should be put into tracing the TSZ to the southeast under the thick glacial cover. Reverse circulation drilling or cross-sectional diamond drilling should be considered.

The structure along the valley west of Lacarte's cabin referred to as the 10400E structure, even though only minor values have been located to date, warrants careful follow-up. The soil geochemistry, the strong topographic feature and the similarity to the Tyranite setting indicate this structure may have potential. Critical areas of the soil anomaly should be stripped bearing in mind that the anomaly may be reflecting a mineralized till streak. Eventually the structure should be drilled near the swampy area beside Lacarte's road to Hare Lake.

Good, isolated, concentrations of gold in iron formation occur in the GE #2 trench at the near the SW corner of Hare Lake. Even though the values found to date have too short a strike length to be of importance, larger volumes of iron formation could have potential for economic shoots. A very detailed magnetic survey should be done here to outline possible iron formation in

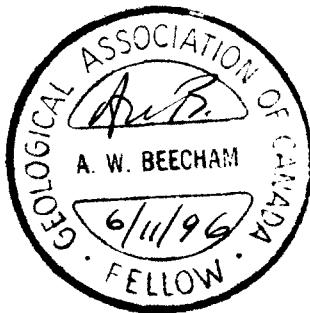

the swampy ground and parts of Hare Lake adjacent to these showings. The general area of the Lacarte Main showing with the altered, mineralized porphyry dome or intrusive plug combined with the local folding at this point and the numerous minor gold occurrences suggests this area may have potential for McIntyre-Hollinger and Camflo type deposit. At some stage the intrusive should be tested by diamond drilling at depth of, perhaps, 200m.

The mineralization located at L9+10N/8+50E, referred to as the Blow Down Showing, although containing only a couple low assays, is very isolated and appears to mark a completely new structure. Stripping of the showing should be extended with a light backhoe.

Respectfully submitted

Credits you are claiming in this report may be cut back. In order to minimize the adverse effects of such deletions, please indicate from which claims you wish to prioritize the deletion of credits. Please mark (✓) one of the following:

1. Credits are to be cut back starting with the claim listed last, working backwards.
 2. Credits are to be cut back equally over all claims contained in this report of work.
 3. Credits are to be cut back as prioritized on the attached appendix.

In the event that you have not specified your choice of priority, option one will be implemented.

Note 1: Examples of beneficial interest are unrecorded transfers, option agreements, memorandum of agreements, etc., with respect to the mining claims.

Note 2: If work has been performed on patented or leased land, please complete the following:

I certify that the recorded holder had a beneficial interest in the patented or leased land at the time the work was performed.

Les crédits que vous réclamez dans le présent rapport peuvent être réduits. Afin de diminuer les conséquences défavorables de telles réductions, veuillez indiquer l'ordre dans lequel vous désirez au'elles soient appliquées à vos claims. Veuillez cocher (✓) l'une des options suivantes :

- Les crédits doivent être réduits en commençant par le dernier claim sur la liste.
 - Les crédits doivent être réduits également entre tous les claims figurant dans le présent rapport.
 - Les crédits doivent être réduits selon l'ordre donné en annexe.
- Si vous n'avez pas choisi d'option, la première sera appliquée.

ste 1 : Examples d'intérêts bénéficiaires : cessions non enregistrées, ententes sur des options, protocoles d'entente, etc. relatifs aux claims.

ste 2: Si des travaux ont été exécutés sur un terrain faisant l'objet de lettres patentes ou d'un bail, veuillez remplir ce qui suit:

e certifie que le titulaire enregistré possédait un intérêt bénéficiaire sur le terrain faisant l'objet de lettres patentes ou d'un bail, au moment où les travaux ont été exécutés.	Signature	Date

Statement of Costs for Assessment Credit

Etat des coûts aux fins du crédit d'évaluation

Mining Act/Loi sur les mines

Transaction No./N° de transaction

Personal information collected on this form is obtained under the authority of the Mining Act. This information will be used to maintain a record and ongoing status of the mining claim(s). Questions about this collection should be directed to the Provincial Manager, Minings Lands, Ministry of Northern Development and Mines, 4th Floor, 168 Cedar Street, Sudbury, Ontario P3E 6A5, telephone (705) 670-7284.

Les renseignements personnels contenus dans la présente forme sont recueillis en vertu de la Loi sur les mines et serviront à tenir à jour un registre des concessions minières. Adresser toute question sur la collecte de ces renseignements au chef provincial des terrains miniers, ministère du Développement du Nord et des Mines, 168, rue Cedar, 4^e étage, Sudbury (Ontario) P3E 6A5, téléphone (705) 670-7284.

1. Direct Costs/Coûts directs

Type	Description	Amount Montant	Totals Total global

	<i>Soil GECHEM ANALYSES</i>	11,972	
		17,778	
Equipment Rental Location de matériel	Type		
	Total Direct Costs Total des coûts directs	63,011	<i>frs</i>

Note: The recorded holder will be required to verify expenditures claimed in this statement of costs within 30 days of a request for verification. If verification is not made, the Minister may reject for assessment work all or part of the assessment work submitted.

2. Indirect Costs/Coûts indirects

Type	Description	Amount Montant	Totals Total global
Transportation Transport	Type <i>INCLUDED</i>		
	<i>in Contract</i>		
	<i>CHARGES</i>	<i>frs</i>	
Food and Lodging Nourriture et hébergement		7980	7980
Mobilization and Demobilization Mobilisation et démobilitation			
Sub Total of Indirect Costs Total partie des coûts indirects			7980
Amount Allowable (not greater than 20% of Direct Costs) Montant admissible (n'excédant pas 20 % des coûts directs)			7980
Total Value of Assessment Credit (Total of Direct and Allowable Indirect costs)			70,991
Valeur totale du crédit d'évaluation (Total des coûts directs et indirects admissibles)			

Note : Le titulaire enregistré sera tenu de vérifier les dépenses demandées dans le présent état des coûts dans les 30 jours suivant une demande à cet effet. Si la vérification n'est pas effectuée, le ministre peut rejeter tout ou une partie des travaux d'évaluation présentés.

Filing Discounts

Work filed within two years of completion is claimed at 100% of the above Total Value of Assessment Credit.

Work filed three, four or five years after completion is claimed at 50% of the above Total Value of Assessment Credit. See calculations below:

Total Value of Assessment Credit	Total Assessment Claimed
12,776	x 0.50 = 6398
12,776	50%
TOTAL	# 64593

Certification Verifying Statement of Costs

I hereby certify:
that the amounts shown are as accurate as possible and these costs
are incurred while conducting assessment work on the lands shown
on the accompanying Report of Work form.

at as AGENT I am authorized
(Recorded Holder, Agent, Position in Company)

make this certification

Remises pour dépôt

1. Les travaux déposés dans les deux ans suivant leur achèvement sont remboursés à 100 % de la valeur totale susmentionnée du crédit d'évaluation.
2. Les travaux déposés trois, quatre ou cinq ans après leur achèvement sont remboursés à 50 % de la valeur totale du crédit d'évaluation susmentionné. Voir les calculs ci-dessous.

Valeur totale du crédit d'évaluation	Evaluation totale demandée
	x 0.50 =

Attestation de l'état des coûts

J'atteste par la présente :
que les montants indiqués sont le plus exact possible et que ces
dépenses ont été engagées pour effectuer les travaux d'évaluation
sur les terrains indiqués dans la formule de rapport de travail ci-joint.

Et qu'à titre de _____ je suis autorisé
(titulaire enregistré, représentant, poste occupé dans la compagnie)

à faire cette attestation.

Dear Sir or Madam:

Submission Number: 2.16885

Status

Subject: Transaction Number(s): W9680.00560 **Approval After Notice**

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

NOTE: This correspondence may affect the status of your mining lands. Please contact the Mining Recorder to determine the available options and the status of your claims.

If you have any questions regarding this correspondence, please contact Bruce Gates by e-mail at gates_b@torv05.ndm.gov.on.ca or by telephone at (705) 670-5856.

Yours sincerely,

A handwritten signature in black ink, appearing to read "Ron C. Gashinski".

4h	Argillite with Py and graphite
4f	Altered, silicified, banded magnetite iron formation
4s	Siltstone
3f	Thin bedded, fine felsic tuff
3g	Feldspar phryic tuff, tuff Bx
3h	FP intrusive, dacite intrusive
3m	Fine intermediate volcanic ash "trachyte"
3l	Intermediate, bedded, fine ash, tuff
2	Mafic volcanics, 2a. massive, 2d. pillowied;
1	Komatiites; 1a spinifex textured 1b polyhedral jointed; 1c komatiitic basalt;

Symbols and Abbreviations

Au	Gold occurrence, Showing	cc	carbonatization
48	Assays, grab sample ppb Au	#	silicification
111	Assays channel sam. g/t Au/m	V.G.	visible gold
()	Diamond drill hole	Unit	banded spinifex magmatic
~	muck pile, flat muck cover	mt	magnetite
•	pyrite diss'n, blebs, veins > 3%	Py	pyrite
—	quartz vein	Cp	chalcopyrite
—	earth, rock trench	qv	quartz vein
⊕	stake, location point	qcv	quartz carbonate vein
—	fault, shear zone	gf	graphite
		W	water cover

Legend

- 10 Diabase
- 8f Fine grained chlorite carbonate rock
- 5b Serpentinite
- 5h Hornblende porphyritic diorite, gabbro
- 4a Argillite, siltstone;
- 4h Argillite with Py and graphite
- 4f Altered, silicified, banded magnetite iron formation
- 4s Siltstone
- 3f Thin bedded, fine felsic tuff
- 3g Feldspar phryic tuff, tuff Bx
- 3h FP intrusive, dacite intrusive
- 3n Fine intermediate volcanic ash "trachyte"
- 3l Intermediate, bedded, fine ash, tuff
- 2 Mafic volcanics, 2a. massive, 2d. pillow'd;
- 1 Komatiites; 1a spinifex textured
1b. polyhedral jointed; 1c komatitic basalt;

Symbols and Abbreviations

Au	Gold occurrence, Showing	cc	carbonization
>	Assays, grab sample g/t Au	#	silicification
—	Assays channel sam. g/t Au/m	V.G.	visible gold
○	Diamond drill hole	Qmt	banded quartz magnetite
□	Claim post, line	mt	magnetite
—	pyrite diss'n, blebs, veins > 3%	Py	pyrite
—	quartz vein	Cp	chalcopyrite
—	earth, rock trench	qv	quartz vein
⊕	stake, location point	qcvc	quartz carbonate vein
—	fault, shear zone	gf	graphite
—	muck pile, flat muck cover	W	water cover
