1.0 Introduction and Past Work

Trader Resource Corp.'s Papoose Creek Property consists of five claim blocks comprising 51 units (816 hectares) located in southern Asquith and Fawcett townships near the village of Shining Tree, Ontario (Figure 1). The property was staked in 1991, and is accessed via logging roads originating off Highway 560 about 10 km south of Shining Tree. The claims are numbered L1182220, L1182221, L1182222, L1182223 and L1182224.

The property was transferred by Royal Oak Mines Inc. to Trader Resource Corp. (a subsidiary company) in 1992 with work performed and management undertaken by Royal Oak Mines Inc. personnel. Compilation work and geological field studies were completed on the property through 1992 and 1993 by Royal Oak Mines Inc. geological staff.

Linecutting and geophysical surveys (Total Field Magnetics, VLF Electromagnetic and Horizontal Loop Electromagnetics) were completed over a selected portion of the property in the fall of 1993 ("gridded area" of Figure 1) by Exsics Ltd. of Timmins. This past work is documented in the report "Trader Resource Corp., Papoose Creek Property, 1992/1993 Assessment Report, Geotechnical Surveys" (Robb, 1993).

2.0 Geology and Geophysics

2.1 General Geology

The geology of the Shining Tree area is described in OGS Report 240 (Carter, 1987). The underlying bedrock consists of intercalated mafic and felsic volcanics which trend generally ESE across the map area. Intrusions consisting of batholiths, sub-volcanic intrusions and diabase dikes and sills cut these volcanics. All units (except diabase) have been offset by NW-trending faults.

2.2 Property Geology

Mapping in 1993 identified a package of felsic volcanic rocks about 200m thick trending ESE underlying claim 1182220. They contain distinct blue and grey quartz eyes, feldspar crystals and are locally fragmental. One area containing a cherty pyritic horizon was noted at the eastern portion of claim 1182220. Enclosing the felsic volcanics are a sequence of chloritic mafic volcanics consisting mainly of massive flows, with a pillow breccia noted at one location. A large mafic intrusive body lies north of the volcanics at the eastern edge of the property.

(2)

Numerous diabase dikes cut through the volcanic pile. Mapping in 1993 indicated that these dikes are oriented at about 340° and occur at 100-150m intervals across the entire property. Also, diabase was mapped with a contact parallel to stratigraphy, indicating the possibility of diabase sills within the volcanic pile. A consistent steep plunge was noted in several lithologies, measured as mineral lineations and stretched fragments.

2.3 Geophysics

The geophysical surveys were successful in identifying several conductors and magnetic trends on the property. Two conductors ("A" and "B") were deemed worthy of follow-up work (Figure 2).

Conductor A, between Lines 7 to 13 West at about 50-100m south, is particularly interesting as it is a relatively weak but deep conductor (90-100m) with a magnetic high response in an area underlain by felsic volcanics.

Conductor B, about 350m south of Conductor A, is in an area not mapped in detail.

3.0 1994 Exploration Program - Diamond Drilling

As a direct result of the encouraging geological work and geophysical survey results completed in 1993, a program to complete about 500m of diamond drilling was initiated in April of 1994.

3.1 Objectives

The drilling program was laid out to accomplish several objectives, the primary being to explain the cause of Conductors A and B. Secondary objectives included determining the cause of the magnetic high associated with Conductor A, coring as much of the felsic sequence as possible, and determining the thickness and abundance of diabase dikes which dissect the felsic volcanics.

3.2 Results

Drilling on the Papoose Creek Property started on April 20 and was completed on April 25, 1994. A total of 522.2 m was drilled in three holes.

(3)

3.2.1 Drill Hole PAP94-1

PAP94-1 was collared on Line 11+00W at 1+50S, on an Azimuth of 075° at -45°. This orientation was chosen so as to be perpendicular to any diabase dikes cutting the volcanics. The hole was targeted to test Conductor A at a vertical depth of about 90m where it crosses Line 10+00W at 0+80S.

The hole collared into coarse grained mafic volcanics, then cut a sequence of mafic sediments and volcanics, with a section of rhyolite at 69.0-73.9m. From 113.5 to 154.8m, the hole cored felsic volcanics consisting of massive flows and lapilli tuff. Three diabase intervals cut the volcanics; the largest, between 121.8 and 137.5m, was coarse grained and magnetic, and is the probably cause of the mag anomaly flanking Conductor A. The conductor itself was probably due to an argillite sequence between 154.8 and 157.4m, which was graphitic in 5cm zones throughout the interval. The hole ended in chloritic, fine grained mafic volcanics.

3.2.2 Drill Hole PAP94-2

PAP94-2 was collared on Line 12+00W at 2+00S, on an Azimuth of 030° (Grid North) at -50°. The hole was targeted to test Conductor A at a vertical depth of 120m in an area with an anomalous geochem sample (DX04580; 169 ppm Cu and 390 ppm Zn (Robb, 1993)).

The hole collared into chloritic mafic volcanics which were intercalated with felsic and mafic tuffs in zones a few meters thick. From 184.5 to 204.3m, there were several intervals of graphitic argillite <1.0m thick, which could be the cause of Conductor A on Line 12+00W. Also, conductive beds of pyrite and disseminated pyrrhotite occurred within graphitic argillite between 202.4 and 204.3m. The hole ended in coarse grained, massive mafic volcanics.

3.2.3 Drill Hole PAP94-3

PAP94-3 was drilled to determine the cause of Conductor B, which is about 350m south of Conductor A. It was collared at 9+75W at 5+00S, on an Azimuth of 315° at -45°. This location and orientation was chosen in order to be between and parallel to the two diabase dikes which cut Conductor B.

The hole collared into intermediate and rhyolite tuffs with 1-3% blue quartz eyes and variable biotite alteration. The interval 16.5-21.4m was mineralized with trace disseminated pyrite and 0.5 to 1% sphalerite from 17.4 to 21.4m. A second

section of rhyolite tuffs with sericite and biotite alteration was cored between 59.1 and 110.7m. The section from 69.2 to 69.9m is well mineralized with about 2% sphalerite as a fine dusting on bedding planes and in crossing veinlets. The section between 99.0 and 99.4m is also well mineralized with 2% sphalerite. Between 94.2 and 110.7m the rhyolite tuff contained several graphitic interbeds a few cm wide, which was the probable cause of Conductor B. The hole ended in chloritic, massive medium grained mafic volcanics.

4.0 CONCLUSIONS AND RECOMMENDATIONS

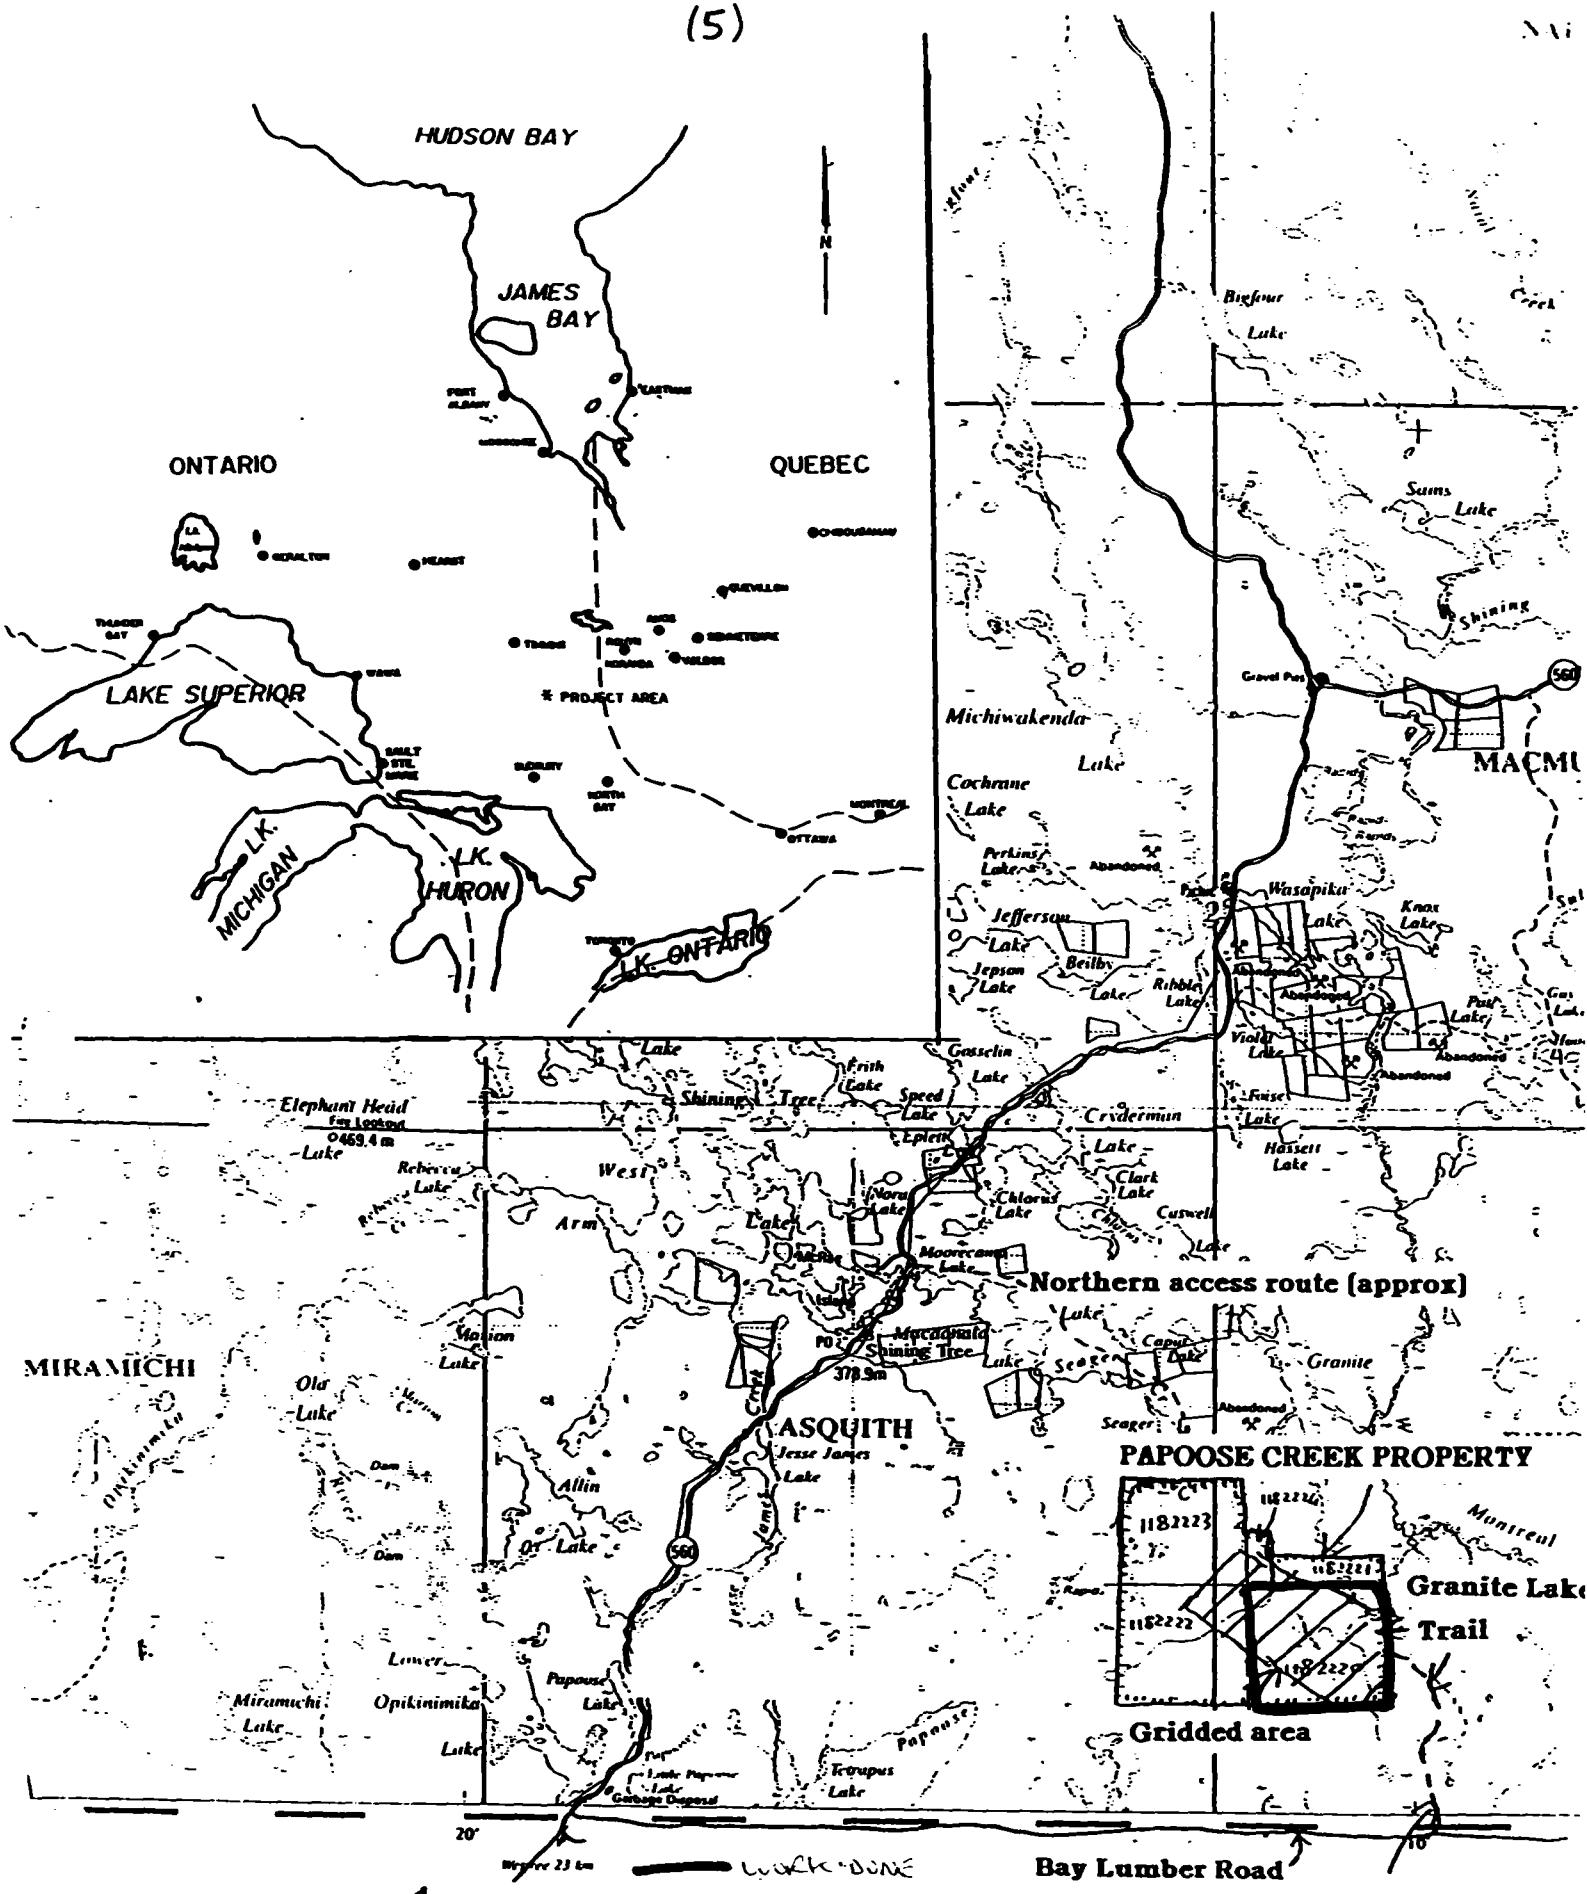

The drill program was successful in explaining the cause of Conductors A and B, as well as determining the cause of the magnetic high associated with Conductor A.

The gold values returned from the core samples were low, but the property still has the potential to host a base-metal deposit. Of particular interest was the fine dusting of sphalerite mineralization observed in hole PAP94-3. This mineralization occurs within two distinct horizons of biotite-sericite altered felsic volcanics near Conductor B.

The Papoose Creek Property requires additional work to fully assess its base-metal potential. Recommendations would include taking whole rock samples from the drill core of this program to determine if any hydrothermal alteration has affected the felsic volcanic stratigraphy. Also, mechanical stripping of the area near Conductor B, followed by detailed mapping and sampling is needed to get a better understanding of the controls and environment of the mineralization observed in hole PAP94-3.

STATEMENT OF QUALIFICATIONS

I, Peter G. Harvey, of the City of Timmins, Province of Ontario, do hereby certify that:

- 1 I received a B.Sc. degree (Honours) in Geology from Lakehead University, Thunder Bay, Ontario, in 1985.
- 2 I have been employed as a geologist by various mining companies in Ontario since 1985.
- 3 I am the author of this report.
- 4 I have no direct interest, nor do I have any shares of any company exploring the properties described in this report, nor on any adjacent or surrounding properties.

Dated this 12th day of August 1994, Timmins, Ontario.

A handwritten signature in black ink, appearing to read "Peter G. Harvey".

SUMMARY LOG

Hole Number: PAP94-1

Date Drilled: April 20-22, 1994

Contractor: MacKenzie Drilling Ltd.

Property: Papoose Creek (Trader Resource Corp.)

Township: Fawcett

Claim No.: 1182220

Co-ordinates: Line 11+00W, 1+50S, Az 075°, dip -45°

Total Depth: 167.4m

Survey: Acid Test

Size: BQ

Overburden: 6.7m overburden; 6.7m BW casing left in hole

Purpose: Test HLEM Conductor "A" at 90m on Line 10+00W; also, determine the cause of the mag anomaly associated with the conductor

Logged by: P. Harvey, April 24, 1994

Note: Core stored at Hollinger Core Storage facility, Schumacher, Ontario

RESULTS

GEOLOGY

The hole cored a mixed sequence of mafic, intermediate and felsic volcanics and related tuffs. The mafics were generally coarse grained and massive. Several intervals from the felsic volcanics were altered and pyritic. A diabase sill between 121.8 and 137.5m is probably the cause of the mag anomaly associated with Conductor A, which is due to the conductive, graphitic argillite between 154.8 and 157.4m.

SAMPLING

Selected intervals were sawed and assayed for gold. The best value was between 81.6 and 83.0m, which returned 0.021 opt Au/1.4m from a pyritic tuff.

METERS	LITHOLOGY
0.00- 6.70	Casing
6.70- 69.00	Massive mafic volcanic, gabbroic texture, chloritic alteration. Fine grained, chloritic schist intervals generally <1.0m throughout, often contain qtz-calcite veining with k-spar at low angle to C.A.
69.00- 73.90	Aphanitic rhyolite-rhyolite tuff. Contains 1% garnet crystals <2mm and 1-2% feldspar phenocrysts towards lower contact.
73.90- 75.65	Chloritic mafic sediment, fine grained, bedding at 35° C.A., few qtz-cal veinlets.
75.65- 84.00	Chloritic mafic sediment as at 73.90, but coarse grained. 1-3% garnets <mm throughout. Bedded at 30° C.A. Fault-rubble core at 81.50-81.60.
84.00-111.80	Massive mafic volcanic, gabbroic texture; as at 6.00-69.00.
111.80-113.50	Mafic sediment-tuff, chloritic; bedded at 40° C.A.
113.50-116.50	Felsic lapilli tuff, fragments loosely packed in aphanitic, siliceous matrix; 1-2% disseminated pyrite. Bedded at 40°.
116.50-118.00	Diabase dike - fine grained.
118.00-121.80	Felsic lapilli tuff, siliceous, well mineralized with 1-5% pyrite.
121.80-137.50	Diabase - probably sill - lower contact at 40° C.A. parallel to stratigraphy. Finer grained chill margins 1-5m from contacts; central part coarse grained, and magnetic. Mag anomaly probably due to this diabase sill.
137.50-144.10	Felsic lapilli tuff, well bedded at 30-40° C.A., locally plagioclase porphyritic. Generally well mineralized with 1-3% pyrite and trace sphalerite associated with pyrite locally.
144.10-146.90	Massive rhyolite, very siliceous, trace blue quartz-eyes.
146.90-151.20	Felsic lapilli tuff - moderate - locally strongly sericitic; banded texture; at 30-40° C.A. Well mineralized with 1-5% pyrite and trace sphalerite.

(4)

PAP94-1

METERS	LITHOLOGY
151.20-153.20	Fine-medium grained diabase.
153.20-154.80	Fine grained chloritic sediment, banded; sericitic locally.
154.80-157.40	Argillite - locally graphitic in <5cm zones, commonly graphitic on slip through entire interval; intercalated on cm scale with chloritic and sericitic zones - mixed sediment. Massive pyrite in 2-5cm intervals within graphite sections. Both graphite and massive pyrite sections strongly conductive. Conductor 'A' probably due to this conductive section.
157.40-167.40	Chloritic, fine grained mafic volcanic, minor qtz-calcite veining.
167.40	EOH

Lab 16 P. Harvey

Chief Chemist:

SUMMARY LOG

Hole Number: PAP94-2

Date Drilled: April 22-24, 1994

Contractor: MacKenzie Drilling Ltd.

Property: Papoose Creek (Trader Resource Corp.)

Township: Fawcett

Claim No.: 1182220

Co-ordinates: Line 12+00W, 2+00S, Az 030° (Grid North), dip -50°

Total Depth: 230.7m

Survey: Acid Tests

Size: BQ

Overburden: 5.50m overburden; 6.7m BW casing left in hole

Purpose: Test HLEM Conductor "A" at 120m vertical in area of anomalous geochem samples.

Logged by: P. Harvey, 25 April, 1994

Note: Core stored at Hollinger Core Storage facility, Schumacher, Ontario

RESULTS

GEOLOGY

The hole cored a mixed sequence of mafic, intermediate and felsic volcanics and related tuffs. The mafics were generally coarse grained and massive. The intermediate and felsics were often altered with sericite and biotite, and occasionally contained garnets. Graphitic argillite with bedded sulphides between 184.5-185.9m is the probable cause of Conductor 'A'.

SAMPLING

Selected intervals were sawed and assayed for gold. No significant results were obtained.

METERS	LITHOLOGY
0.00- 5.50	Overburden
5.50- 6.00	Chloritic mafic volcanic.
6.00- 7.80	Intermediate tuff - biotite alteration.
7.80- 19.00	Chloritic mafic volcanic/tuff.
19.00- 19.80	Interval of mafic volcanic intermixed with felsic tuff.
19.80- 20.90	Siliceous rhyolite tuff.
20.90- 45.30	Chloritic mafic volcanic; coarse grained 23.00-45.30.
45.30- 54.80	Sericitic rhyolite lapilli tuff; 1% garnets; variable biotite alteration, rare quartz eyes and graphitic on slips 52.00-54.80.
54.80- 87.40	Chloritic mafic volcanic, coarse grained intervals.
87.40- 88.20	Grey sericitic rhyolite tuff; trace garnets.
88.20-100.30	Chloritic mafic volcanic, coarse grained.
100.30-102.63	Sericitic rhyolite tuff.
102.63-109.00	Chloritic mafic volcanic; coarse grained.
109.00-124.00	Mafic tuff, 1% blue quartz-eyes; felsic fragments locally.
124.00-146.50	Chloritic mafic volcanic; coarse grained.
146.50-155.30	Intermediate tuff, variable chlorite-sericite alteration, conductive graphite argillite with pyrite 152.30-152.80.
155.30-165.30	Chloritic mafic volcanic; fine-coarse grained.
165.30-169.50	Intermediate tuff, graphitic interbeds to 166.70.

METERS	LITHOLOGY
169.50-179.20	Chloritic mafic volcanic; medium grained.
179.20-180.80	Siliceous rhyolite lapilli tuff; cherty.
180.80-184.50	Chloritic mafic volcanic.
184.50-185.90	Graphitic argillite; bedded py + po; conductive, Conductor 'A' probably due to this conductive section.
185.90-191.80	Chloritic mafic volcanic; medium grained.
191.80-193.00	Graphitic argillite; graphitic slips towards lower contact; bedded pyrite.
193.00-202.40	Sericitic, feldspar porphyry intrusive; blocky.
202.40-204.30	Graphitic argillite - conductive bedded pyrite; disseminated po; magnetic graphite on slip.
204.30-230.70	Chloritic mafic volcanic; coarse grained.
230.70	EOH

Change at 52. To dark grey-greenish with small amounts of white. Contains some small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

At 53.5 - 54.6, fine-grained greenish-grey rock with small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

At 54.8 - 56.5, fine-grained greenish-grey rock with small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

At 56.5 - 62.0, fine-grained greenish-grey rock with small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

At 85.3 - 87.4, fine-grained greenish-grey rock with small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

At 87.4 - 88.2, fine-grained greenish-grey rock with small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

At 88.2 - 100.3, fine-grained greenish-grey rock with small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

At 100.3 - 100.3, fine-grained greenish-grey rock with small angular blocks of light-colored material (e.g. 53.2). Some light-colored blocks (e.g. 53.5 - 54.6). Slight weathering. Some blue-grey staining.

SUMMARY LOG

Hole Number: PAP94-3

Date Drilled: April 24-25, 1994

Contractor: MacKenzie Drilling Ltd.

Property: Papoose Creek (Trader Resource Corp.)

Township: Fawcett

Claim No.: 1182220

Co-ordinates: Line 9+75W, 5+00S, Az 315°, dip -45°

Total Depth: 124.1m

Survey: Acid Test

Size: BQ

Overburden: 2.50m overburden; 3.05m BW casing left in hole

Purpose: Test HLEM Conductor "B"

Logged by: P. Harvey, April 30, 1994

Note: Core stored at Hollinger Core Storage facility, Schumacher, Ontario

RESULTS

GEOLOGY

The hole cored intermediate and felsic tuffs with variable biotite and sericite alteration, as well as chloritic, massive, coarse grained mafic volcanics. Sphalerite mineralization was observed between 17.4 and 31.4m, and also between 69.2 and 69.9m. A rhyolite tuff containing cm sized graphitic interbeds is the probable cause of Conductor B.

SAMPLING

Selected intervals were sawed and assayed for gold. No significant results were obtained.

METERS	LITHOLOGY
0.00- 2.50	Overburden
2.50- 7.40	Intermediate tuff; 3% blue quartz-eyes; fine grained biotite alteration.
7.40- 16.50	Siliceous rhyolite tuff; variable biotite alteration.
16.50- 21.40	Chloritic mafic tuff; 1% blue quartz-eyes; disseminated pyrite with up to 1% sphalerite in section 17.40-18.30; 0.5% sphalerite 18.30-21.40.
21.40- 59.10	Chloritic mafic volcanic, coarse grained.
59.10- 64.20	Rhyolite lapilli tuff; biotite alteration, pale brown colour, bleached fractures.
64.20- 67.20	Chloritic mafic volcanic, fine-medium grained.
67.20- 69.20	Intermediate tuff; biotite alteration 67.20-68.20.
69.20- 69.90	Quartz porphyry rhyolite-rhyolite tuff; clear and blue quartz-eyes, well mineralized with about 2% sphalerite as fine dusting on bedding and in crossing veinlets.
69.90- 70.30	Milky white quartz vein.
70.30-71.90	Chloritic mafic tuff.
71.90- 79.50	Siliceous rhyolite tuff; weak biotite alteration; 0.5-2% pyrite.
79.50- 82.20	Feldspar porphyritic rhyolite.
82.20- 94.20	Sericitic rhyolite lapilli tuff; weak biotite alteration; 0.5-1% pyrite.
94.20- 99.40	Quartz-eye porphyritic rhyolite tuff, graphitic 98.50-99.00.

METERS	LITHOLOGY
99.40-110.70	Sericitic, banded rhyolite tuff, 2-3% blue quartz-eyes, cm graphitic interbed 99.70; weak biotite alteration. Conductor 'B' probably due to this weakly conductive section.
110.70-124.00	Chloritic, massive medium grained mafic volcanic.
124.00	EOH

Credits you are claiming in this report may be cut back. In order to minimize the adverse effects of such deletions, please indicate from which claims you wish to prioritize the deletion of credits. Please mark (✓) one of the following:

- Credits are to be cut back starting with the claim listed last, working backwards.
- Credits are to be cut back equally over all claims contained in this report of work.
- Credits are to be cut back as prioritized on the attached appendix.

In the event that you have not specified your choice of priority, option one will be implemented.

Note 1: Examples of beneficial interest are unrecorded transfers, option agreements, memorandum of agreements, etc., with respect to the mining claims.

Note 2: If work has been performed on patented or leased land, please complete the following:

I certify that the recorded holder had a beneficial interest in the patented or leased land at the time the work was performed.	Signature	Peter Harvey	Date Aug 19 '94

Mining Act/Loi sur les mines

Personal information collected on this form is obtained under the authority of the Mining Act. This information will be used to maintain a record and ongoing status of the mining claim(s). Questions about this collection should be directed to the Provincial Manager, Minings Lands, Ministry of Northern Development and Mines, 4th Floor, 158 Cedar Street, Sudbury, Ontario P3E 6A5, telephone (705) 670-7284.

Les renseignements personnels contenus dans la présente formula sont recueillis en vertu de la Loi sur les mines et serviront à tenir à jour un registre des concessions minières. Adresser toute question sur la collecte de ces renseignements au chef provincial des terrains miniers, ministère du Développement du Nord et des Mines, 158, rue Cedar, 4^e étage, Sudbury (Ontario) P3E 6A5, téléphone (705) 670-7284.

1. Direct Costs/Coûts directs

Type	Description	Amount Montant	Totals Total global
Wages Salaires	Labour Main-d'œuvre	6,600	
	Field Supervision Supervision sur le terrain		6,600
Contractor's and Consultant's Fees Droits de l'entrepreneur et de l'expert-conseil	Type Drill Contractor	27,723	
	Assays	1,700	29,423
Supplies Used Fournitures utilisées	Type		
Equipment Rental Location de matériel	Type		
Total Direct Costs Total des coûts directs			

2. Indirect Costs/Coûts indirects

* * Note: When claiming Rehabilitation work Indirect costs are not allowable as assessment work.

Pour le remboursement des travaux de réhabilitation, les coûts indirects ne sont pas admissibles en tant que travaux d'évaluation.

Type	Description	Amount Montant	Totals Total global
Transportation Transport	Type FUEL	360	
			360
Food and Lodging Nourriture et hébergement	Three Bears' Lodge	503	503
Mobilization and Demobilization Mobilisation et démobilisation	Drill Mob/DeMob	2621	2621
Sub Total of Indirect Costs Total partie des coûts indirects			3484
Amount Allowable (not greater than 20% of Direct Costs) Montant admissible (n'excéder pas 20 % des coûts directs)			3484
Total Value of Assessment Credit (Total of Direct and Allowable Indirect costs)		Valeur totale du crédit d'évaluation (Total des coûts directs et indirects admissibles)	39,507

Note: The recorded holder will be required to verify expenditures claimed in this statement of costs within 30 days of a request for verification. If verification is not made, the Minister may reject for assessment work all or part of the assessment work submitted.

Note : Le titulaire enregistré sera tenu de vérifier les dépenses demandées dans le présent état des coûts dans les 30 jours suivant une demande à cet effet. Si la vérification n'est pas effectuée, le ministre peut rejeter tout ou une partie des travaux d'évaluation présentés.

Filing Discounts

1. Work filed within two years of completion is claimed at 100% of the above Total Value of Assessment Credit.
2. Work filed three, four or five years after completion is claimed at 50% of the above Total Value of Assessment Credit. See calculations below:

Total Value of Assessment Credit	Total Assessment Claimed
	x 0.50 =

Remises pour dépôt

1. Les travaux déposés dans les deux ans suivant leur achèvement sont remboursés à 100 % de la valeur totale susmentionnée du crédit d'évaluation.
2. Les travaux déposés trois, quatre ou cinq ans après leur achèvement sont remboursés à 50 % de la valeur totale du crédit d'évaluation susmentionné. Voir les calculs ci-dessous.

Valeur totale du crédit d'évaluation	Evaluation totale demandée
	x 0.50 =

Certification Verifying Statement of Costs

I hereby certify:
that the amounts shown are as accurate as possible and these costs were incurred while conducting assessment work on the lands shown on the accompanying Report of Work form.
that as Project Geologist I am authorized
(Recorded Holder, Agent, Position in Company)

to make this certification

Attestation de l'état des coûts

J'atteste par la présente :
que les montants indiqués sont le plus exact possible et que ces dépenses ont été engagées pour effectuer les travaux d'évaluation sur les terrains indiqués dans la formule de rapport de travail ci-joint.

Et qu'à titre de _____ je suis autorisé
(titulaire enregistré, représentant, poste occupé dans la compagnie)

à faire cette attestation.
