TEXASGULF CANADA LIMITED
REPORT ON GEOPHYSICAL WORK
CHESTER TOWNSHIP
N.T.S. - 41-P-12

CLAIMS: P-451639, P-451640, P-494092, P-492359, P-492360, P-492361
P-499446 and P-499447

A geophysical survey consisting of proton precession magnetometer traverses was performed over eight contiguous claims in Chester Township.

Very Low Frequency (V.L.F.) electromagnetic surveying was done on a portion of the property.

PREVIOUS WORK:

A great deal of previous exploration activity has taken place in Chester Township, mainly in the search of gold. Recently, some effort has been concentrated into transforming the numerous isolated chalcopyrite showings into porphyry copper type deposits.

Work has been carried out in the vicinity of the present claim group by Viewpoint Exploration (1971-1972), Rockzone Mines (1973) and Gomuk Group (1965).

NOV 7, 1977

W. A. GASTEIGER

PRESENT SURVEYS:

Previously cut lines were re-chained and flagged at 100 foot intervals. The present surveys attempted to determine any geophysical expression that might be associated with chalcopyrite mineralization in a pit located at approximately 200 feet north on Line 3200N.

The magnetic results indicate a general east-west trend. This trend is somewhat disturbed in the vicinity of Lines 32W and 36W by anomalously high magnetics in a north-south direction. Most of the area appears to be underlain by porphyritic quartz diorite. The anomalous high running from 200N on Line 0 to 800N on Line 2400W is located near outcrops of basalt or andesite and probably represents a thin (100-200') sequence of these higher susceptibility rocks.

A narrow linear trend occurs along the Base Line from 4000W to 2400W. This zone is defined by only one or at most two fifty foot readings but seems to be fairly continuous. The mineralization occurs about 100' north of this high. This magnetic expression may represent the trend of the mineralization.

The V.L.F. survey partially covered the claim group. The very sharp crossover south of the Base Line is due to an abandoned power line. An interesting crossover occurs at the showing on Line 32W. The conductor strikes in a linear pattern from 36W to 20W. On lines 32W and 24W a second crossover occurs 200 feet further north. These conductors appear to cross-cut the magnetic trends and are likely representative of mineralized shear zones.

CONCLUSIONS:

The geophysical indications provide some encouragement for further

prospecting in the vicinity of the mineralization. The first priority would be to prospect and trench along the strike of the V.L.F. conductor. Also, a horizontal loop or induced polarization test would be warranted on the best conductor (36W at 1+25N).
