Summary

Scintrex Limited was contracted to complete a detailed helicopter-borne combined electromagnetic and magnetic survey over a selected portion of Sothman, Halliday and Midlothian townships. A total of 1545 line kilometres of surveying were completed at 125 metre and 250 metre line spacing. Numerous previously defined zones of conductivity were recorded as well as several new anomalous areas. The large area covered and the high resolution and detailed nature of the survey produced an excellent geophysical framework which, in conjunction with geological mapping, provides an important insight into the stratigraphy of the "Halliday dome".

This report deals with selected portions of the geophysical surveys.

Introduction

This report deals with the results of a detailed helicopter-borne electromagnetic survey conducted by Scintrex Limited of Toronto. Instalations for the survey began on January 16, 1981 and the survey was completed on February 3, 1981.

For the purposes of this report, a total of 11 unpatented mining claims owned by Norcen Energy Resources Limited were covered by a total of 20 line kilometres of surveying. The individual claims covered by the survey are listed and shown on the claims sketch enclosed as Appendix B. The final Scintrex Ltd. report is included as Appendix C.

Location and Access

The centre of the survey area is located approximately 65 kilometres south of Timmins, Ontario. Numerous summer roads traverse the survey area and are accessible from Timmins and Shinning Tree (Provincial highway #560). A power line crosses the survey area and the adjacent service road provides access to parts of the area. Numerous large lakes and navigable rivers also provide access to parts of the area. The United Asbestos Inc. asbestos mine in Midlothian township is serviced by an all-weather road and Scintrex Ltd. used the available facilities as their logistical base throughout the survey.

Topography and Resources

Most of the survey area is rolling hills and adjacent flat lying swamps. Jackpine, spruce and poplar are predominant in the higher ground with the black spruce and muskeg in the swampy areas. The western portion of the area has been extensively logged.

With the exception of one north-south trending esker in the vicinity of Radio Lake which is estimated to be 75 metres thick in places, most of the area is covered by only thin glacial overburden. Numerous outcrop ridges are exposed in the eastern part of the area.

General Geology

The geological setting of the survey area is based on the Ontario Department of Mines Geological Report 79 by E.G. Bright (1970) and numerous private company assessment reports. The area is underlain by the "Halliday dome" of felsic flow and pyroclastic rocks intercalated with mafic pyroclastic and related sedimentary rocks of Archean age. The stratigraphy trends approximately east-west. Northeast trending shear zones and north-south trending faults interrupt the stratigraphy. At least one east-west trending graphitic and pyritic unit crosses the eastern half of the area. Several thick massive pyrite/pyrrhotite plus graphite zones have been reported in the western portion of the area.

Previous Work

No attempt will be made to summarize all of the previous exploration work which has been filed for assessment credit with the Resident Geologist in Kirkland Lake as it is beyond the purpose of this report. However, the following is a list of companies which have been active in the area in the past 15 years:

Falconbridge Copper, Amax, Newmont, Teck, Northgate, Granges, Texasgulf, Stairs Mining, Noranda, Essex, and Talisman Mines.

Many of the previous workers in the area have reported a favourable geological setting with, in some cases, appreciable amount of barren and/or base metal rich sulphide mineralization.

Survey Methods

The specifications for the electromagnetic, magnetic and navigational equipment are discussed in the Scintrex Ltd. report which is included here as Appendix C.

The electromagnetic data were measured by a dual frequency (735 Hz and 3220Hz) coaxial system (HEM-802) mounted in a sensor which was towed below a helicopter. The terrain clearance of approximately 30 metres and the "on line" accuracy of \pm 5 metres was maintained by on-board navigational equipment which included a Bronzer MK-10 radar altimeter and a Del Norle Flying Flagman transponder-based navigation system.

Electromagnetic Results

The results of the airborne electromagnetic survey over the 11 claims are presented in the back pocket of this report. The scale of the map is 1:10,000.

No EM conductors were detected within the claim block.

The claims are underlain by mafic flow breccias.

Conclusions and Recommendations

The 11 mining claims as outlined in Appendix B were surveyed by a high resolution detailed helicopter-borne electromagnetic survey, with a line spacing of 125 metres. No airborne EM conductors were detected within the 11 claims.

The survey provided an improved understanding of the overall stratigraphic sequence in this part of the "Halliday Dome".

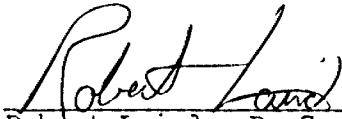

Field examinations of the area with emphasis on exposed geology is required to better define the stratigraphy of the dome as well as isolate areas for detailed exploration.

Declaration

I, Robert J. Laird, of the City of Calgary, in the Province of Alberta, with a mailing address of 715 - 5th Ave. S.W., do hereby declare that:

1. I am employed as Project Geologist-Base Metals, by Norcen Energy Resources Limited, with offices at 715 - 5th Ave. S.W., Calgary, Alberta.
2. I completed a bachelor's degree in the co-op geology program at the University of Waterloo (1978), Waterloo, Ontario, and the M. Sc. (Applied) program in mineral exploration at McGill University (1980), Montreal, Quebec.
3. I have been involved in minerals exploration since 1975.
4. I am a member of the Association of Professional Engineers, Geologists and Geophysicists of Alberta.
5. I did personally set forth the facts as outlined in this report or made references to contractor work where appropriate, and did conduct, supervise, or review the work contained herein.
6. I do not have, nor do I expect to have, any interest in the properties held by Norcen Energy Resources Limited.

Date: November 12, 1981

REPORT ON
HELICOPTER-BORNE GEOPHYSICAL SURVEY
HALLIDAY TOWNSHIP AREA
MATACHewan, ONTARIO

On Behalf Of
Norcen Energy Resources Limited

1. INTRODUCTION

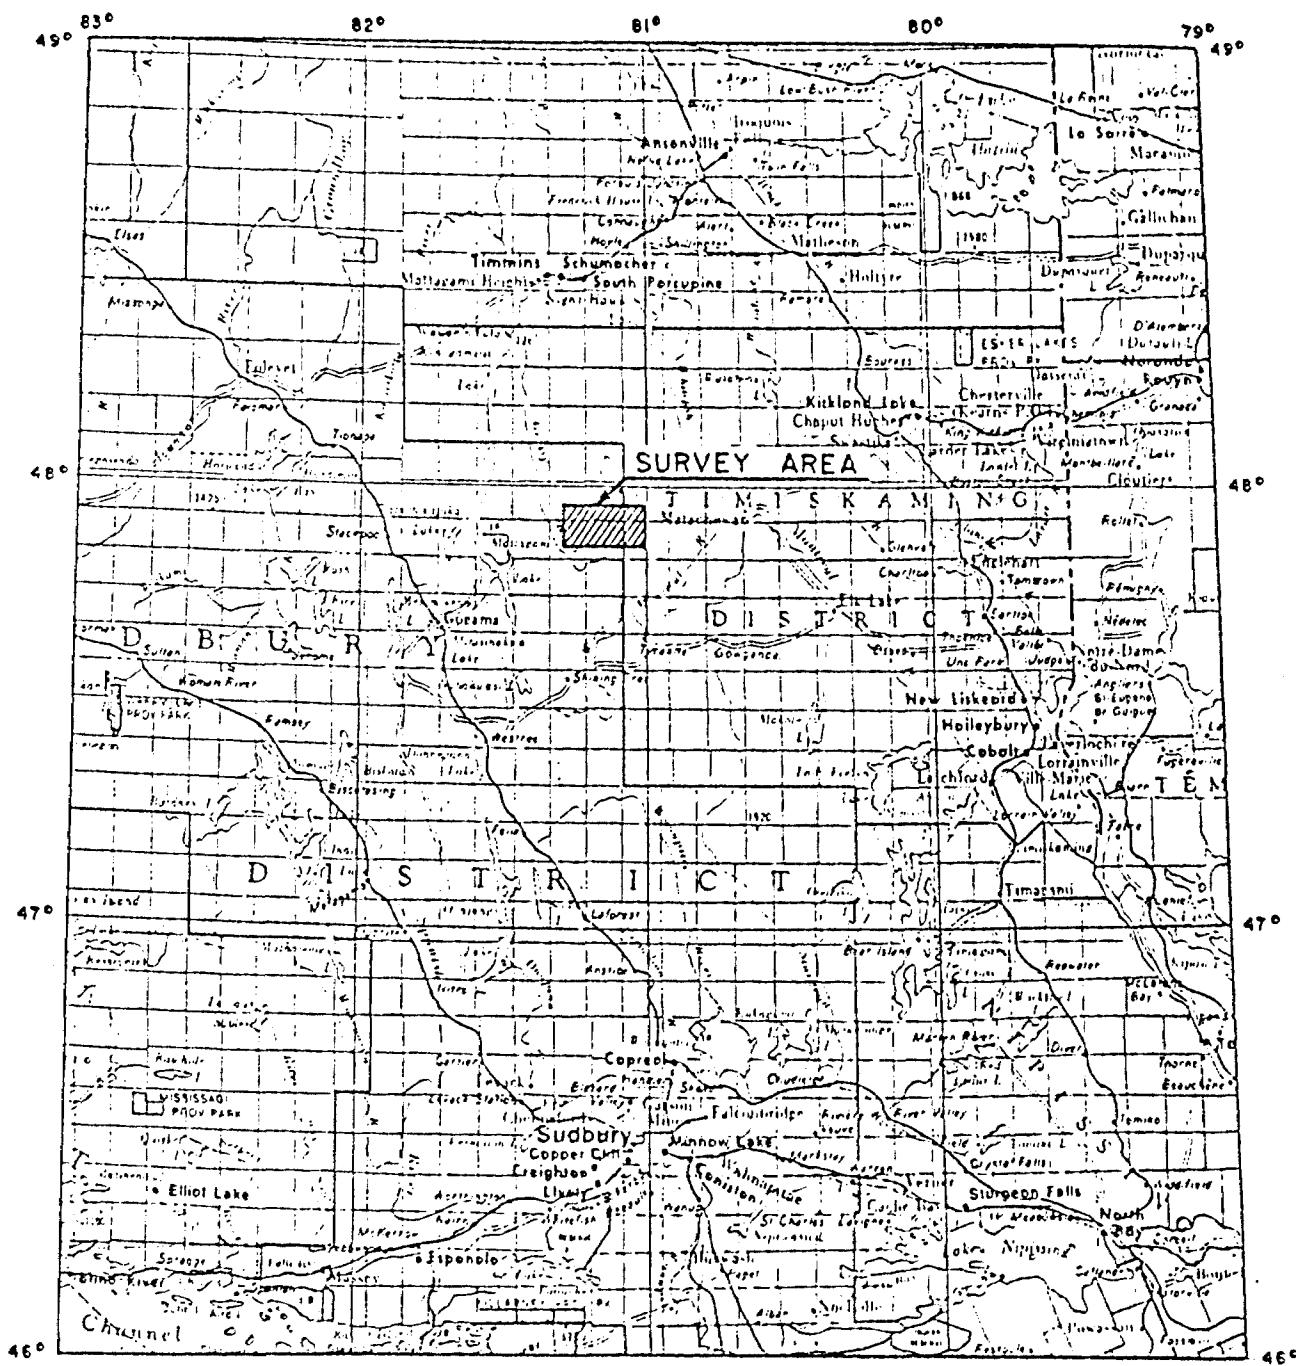

A helicopter-borne geophysical survey was carried out by Scintrex Limited on behalf of Norcen Energy Resources Limited in the Matachewan area of Ontario. The field portion of the work was begun on January 16, 1981 and completed by February 3.

The survey covered an area in and around Halliday Township, Ontario (see Figures 1 and 2). Total coverage, including two magnetic tie lines was 1545 line km (or 1451 line km when measuring from survey boundary to survey boundary only). Principal geophysical sensors were an electromagnetic system (Scintrex HEM-802) measuring in-phase and quadrature secondary field components at 735 and 3220 Hz and a proton precession magnetometer (Scintrex MAP-4). Navigation was controlled by a 'Flying Flagman' radar ranging navigational system.

Results were compiled in Toronto with contoured magnetics and drafted EM anomaly centers at a scale of 1:10,000 being the principal presentation styles.

This report describes the survey procedures, instrumentation and production, in-field compilation and final compilation. Maps showing the results of the work are included both within (plates 1E, 1M, 2E, 2M, 3E, 3M) and outside of (plates 1, 2, 3) this report.

This report was prepared by Scintrex Limited, Concord, Ontario, Canada.

2. SURVEY AREA

The survey area is located approximately 60 miles south of Timmins (or 25 miles west of Matachewan - see Figures 1 and 2). The operations base for the survey was the United Asbestos mine site located on Lloyd Lake, approximately 20 miles west, by road, from Matachewan and immediately to the east of the survey area.

3. SURVEY EQUIPMENT

The survey equipment consisted of the following:

- a) A Scintrex HEM-802 electromagnetic system measuring in-phase and quadrature (out-of-phase) secondary field components at frequencies of 735 and 3220 Hz. (See Appendix 1 for details). The analog output of the EM system was pre-filtered with a low pass filter. The rise time on said filter (rise time = the time required for an impulse response to go from 10% to 90% of the impulse value) was 0.50 seconds. The digital recording rate of all HEM data was 0.5 seconds.
- b) A Scintrex MAP-4 proton precession magnetometer with the sensor mounted in the HEM bird (see Appendix 2 for details).
- c) A Scintrex RCM-8 eight channel analog recorder (hot pen type).
- d) A Sonotek SDS-1200 digital data acquisition system.
- e) A Bonzer MK-10 radar altimeter.
- f) A 60 Hz monitor.
- g) A Scintrex IITC-2 intervalometer.
- h) A Vinten 16 mm camera.
- i) A Del Norte Flying Flagman transponder-based navigational system (see Appendix 3 for details).
- j) Instrument mounting rack, base station magnetometer, test equipment, tools and spare parts.

4.

SURVEY SPECIFICATIONS AND SURVEY CREW

The survey specifications were as follows:

Line Spacing - 125 m (410 ft) and 250 m (820 ft).

Sensor terrain clearance - 100 to 150 ft.

Aircraft speed - 70 mph.

The survey crew consisted of:

Geophysicists - Ian Johnson/Vince Tanzini

Operator 1 - John Glover

Operator 2 - Evan Veroni

Dataman - Paul Conroy

Pilot - John Hall/John Ahlstrom

Michael Lewis, Operations Manager of Scintrex, maintained overall supervision from the Scintrex office in Concord (Toronto). John Gillan of Norcen Energy Resources was on site at the start and end of the project.

The helicopter, C-GGUB, a Bell 206B, was owned and operated by Huisson Aviation Limited, Timmins, Ontario.

5.

FIELD PROCEDURES AND PRODUCTION SUMMARY

If all were to proceed without failures or interruptions, the field work would advance according to:

- a) Install equipment in helicopter, assemble HEM 'bird', set up base station magnetometer, install the two fixed transponders.
- b) Ground test and HEM warm up.
- c) Fly survey.
- d) Check and edit all analog traces, develop flight path film and plot back the flight path (as a check against the Flying Flagman operation).

The acceptable data was produced on 18 survey flights (see Table 1 for details).

Any given flight would normally proceed as follows:

- a) Ground system and magnetometer check.
- b) Take off.
- c) Airborne systems check (including Flying Flagman) and pre-flight analog/digital calibration sequence.
- d) Fly lines.
- e) Post-flight analog/digital calibration sequence.
- f) Land.

The one technical procedure requiring special attention was the installation and operation of the Flying Flagman navigational system. This system operates with two ground (remote or slave) transponders and one airborne (master) transponder. The master communicates with both remotes in order to establish the distances from master to both slaves. (The communication signal is transmitted at approximately 9 Gigahertz and then only during short 'on' periods separated by approximately 1 millisecond).

The two distances, master to remote (T_1) and master to remote (T_2), are internally compared with the base line distance (T_1 to T_2) which was entered earlier by flying across the base line, the Flying Flagman system automatically recognizing the minimum distance point. Triangulation gives the x-y coordinate at a given point in time. The pre-programmed grid is compared with actual position to provide direction to the pilot. X and Y coordinates are recorded on the digital data acquisition system with updates every 0.5 seconds.

TABLE 1
SURVEY PRODUCTION SUMMARY

<u>Flight</u>	<u>Date</u>	<u>Lines Surveyed & Accepted</u>
1	January 23	--
2	January 24	1-6
3	January 25	7-11
4	January 27	12-17
5	January 28	18-29
6	January 28	32-42
7	January 28	42-55
8	January 29	56-67
9	January 29	68-70
10	January 30	--
11	January 31	--
12	January 31	71-82
13	January 31	83-91
14	January 31	94-105
15	February 1	108-115
16	February 3	116-127
17	February 3	129-155, MTL1
18	February 3	30,31,92,93,106,107,MTL2

N.B: Lines 1 to 123 inclusive were flown with a 125 m line spacing.

Lines 123 to 155 inclusive were flown for odd numbered lines only (giving an effective line spacing of 250 m).

Positional information is recorded to the nearest 0.1 m; actual accuracy is probably ± 5 m.

The two fixed transponders were set up - a) in the fire tower on Mount Collins, and b) on Mount Sinclair (see Figure 2). These locations permitted line of site coverage for the entire survey area. Having fixed these ground stations, the system was initialized by setting the start and end points of line zero (just outside, to the east of and parallel to the north-south boundary line of the survey area (Eastern edge)). As the system programs the flight plan as a rectangular grid, all line stop-starts, except those in the northeast corner, were controlled manually using the photomosaic.

The survey work proceeded in most parts without incident. A few points should however be mentioned.

- a) Flight No. 2 was aborted due to dropping the HEM bird. The sensor was repaired and used to complete the survey. A noticeable and yet acceptable increase in EM noise levels ensued.
- b) A power line running approximately north-south through the center of the area rendered the EM data useless for approximately one line spacing (125 m) on either side.

6. DATA RECORDING

6.1 Analog Records

The analog records display the following:

<u>Channel</u>	<u>Content</u>	<u>Approximate Full Scale Gain</u>
1	60 Hz monitor	--
2	735 Hz in-phase	150 ppm
3	735 Hz quadrature	150 ppm
4	3220 Hz in-phase	150 ppm
5	3220 Hz quadrature	150 ppm
6	Magnetometer	100 gammas
7	Magnetometer	1000 gammas
8	Altimeter	500 ft

Fiducial (one per second) counters are shown above channel 1 and below channel 8.

Chart speed is 2 mm/second. Lines and fiducial numbers are manually labelled.

Where the fiducial trace is seen the system is on line and all recording systems on.

The analog records for the survey have been fan-folded and stored in envelopes, one per flight.

At the start and end of each flight are calibration sequences. The four EM channels are calibrated by activating pre-set 100 ppm (parts per million) calibration pulses. The magnetometer channels are calibrated on analog only as the digital records read directly in gamma. The same holds true of the radar altimeter record.

The base station magnetometer recorder was run with 100 gamma full scale and at a chart speed of 10 cm/hr. Throughout the production survey work, the base station magnetometer showed no anomalous external field magnetic activity.

Flight logs, maintained by the operator, show all lines surveyed, start and end fiducial points, initializing information and any non-standard events.

6.2 Digital Records

All airborne survey data were recorded on the digital data acquisition system. Fiducials and magnetometer readings were updated every 1 second. All time EM, altimeter and positioned x-y data were sampled every 0.5 seconds. All EM data were digitally sampled after electronic filters of rise times 0.5, 1.1 and 2.2 seconds.

Recording was on 9-track magnetic tape, 800 bpi format.

7. IN-FIELD COMPIILATION

The analog records were studied for quality and consistency. All lines were labelled and fiducials marked. The flight path film was developed and edited. The flight path was recovered on photomosaics (scale 1" = $\frac{1}{4}$ mile) to ensure area coverage at agreed line spacings. Prominent electromagnetic anomalies were identified and plotted on an overlay ('red-ball') map at the scale of the photomosaics. These maps were presented to Norcen at the end of the field work.

8. PRESENTATION

8.1 Base Map

The flight path was machine plotted at a scale of 1:10,000. The flight path film was used to outline all significant topographic features on the photomosaic base (photo-enlarged to a scale of approximately 1:10,000). Such topographic features were then transferred in outline to the flight path map by comparing fiducials. Such a scheme was adopted as the photomosaics were of uncertain quality; a gross scaling error of approximately 2%, and possibly more severe local offsets were apparent.

The resultant planimetric maps were used as base maps for the presentation of the geophysical results. The photo-enlarged photomosaics which show no survey information are included as complimentary maps to the planimetric maps used.

8.2 Electromagnetic Anomaly Selection and Plotting

The analog records were studied for anomalous responses, all of which were analyzed and plotted. Those responses which were considered as due to "lake bottom" sediments (typified by a broad, low amplitude response primarily in the 3220 Hz quadrature channel) were most often omitted from consideration. All anomalies selected for presentation showed some response in the 735 Hz quadrature channel (even if none in the 735 Hz in-phase channel).

All selected anomalies were analyzed by computer and the interpreted conductance and depth to source estimates listed (assuming a vertical half plane model). For plotting purposes, the average conductance and depth to source (average for the two sensing frequencies) are shown under the anomaly centers. If no inversion calculation has been undertaken for the low frequency anomaly (due for example to no observed response in the in-phase component), the conductance and depth to source estimates for the high frequency response calculation are plotted.

The anomaly centers have been plotted as one of four possible categories. These are described in the map legend as follows:

- CATEGORY 3 (735Hz In-phase amplitude > 10 ppm) _____ ●
- CATEGORY 2 (Oppm < 735 Hz In-phase amplitude ≤ 10 ppm) _____ ○
- CATEGORY 1 (Oppm = 735 Hz In-phase amplitude) _____ □
- CATEGORY 0 (either 735 or 3220Hz In-phase amplitude < Oppm) _____ □

Where the listing shows a negative depth to source, this is set to zero for plotting purposes.

8.3 Magnetic Contour Map

All magnetic data was machine contoured at the scale of 1:10,000. The minimum contour interval is 10 gammas. Magnetic contouring was done by Dataplotting Services Limited, Toronto.

Lines 1 to 29 inclusive showed a digital magnetic record of uncertain quality. As a result, magnetic data for these lines was manually digitized from the analog records before entering the machine contouring process.

In the northwest corner of the survey area, magnetic anomalies were encountered which caused, for certain line segments, the magnetometer to go 'off-lock' with a consequent loss of data.

In general, given the navigational quality of the data set, the contoured magnetic data may be treated with confidence. Apart from loss of data in the northwest corner of the survey area, the data set is complete with no apparent compilation problems. The power line does not noticeably affect the contoured magnetics.

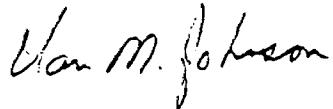

Throughout most of the survey area, the magnetic field is characterized by extensive regions of low magnetic gradients. Such regions produce the most rigorous tests for airborne magnetic data sets and the processing algorithms used. Given the navigational accuracy available and the absence of marked external field magnetic activity, the results should be of good quality. The only distraction from the ideal is a small levelling residue which is somewhat apparent as north-south stripping. This is not felt to be a major problem and could be improved upon with a higher density of control lines and a more sophisticated levelling algorithm.

9. CONCLUSIONS

A helicopter-borne electromagnetic and magnetic survey of approximately 1500 line km has been completed on behalf of Norcen Energy Resources Limited in the Halliday Township area of Ontario. Results, including the radar ranging flight path have been plotted at a scale of 1:10,000. Numerous high conductance EM targets are indicated. Comparison with the contoured magnetics would guide the assignment of conductor axes and priorities thereof. The interpreted results should be of high quality, as the survey flown was of the "high resolution" type.

FLYING FLAGMAN SPECIFICATIONS

Working Principle	Ranges from the moving vehicle to two or more ground transponders are measured many times per second and processed continuously by a microprocessor to give position, track and track error steering information
Equipment	The two or more ground stations each have a transponder and antenna and use an AC power supply or a battery for power. The airborne equipment consists of a master transponder, digital distance measuring unit, DDMU control panel, pilot's L-R control panel, steering indicator, power supply, and antenna.
Operating Range	Up to 80 km (50 miles) line of sight from the ground transponders
Range Accuracy	It is within 3 meters at 80 km
Weight	Approximately 40 lb (18.1 kg) depending upon the aircraft
Flight Patterns Available	Long straight tracks (74 km, plus), multiple parallel tracks, oval patterns, circular patterns
Line Spacings	Selectable between 013 meters and 3045 meters
Remote Transponders	A remote transponder is approximately the size of a briefcase and weighs 15 lb. The antenna weighs 1 lb. They draw a maximum of 0.7 amp at 24 V and can operate for several days with automobile batteries or permanently with a small power supply using 115 V AC input. They are weatherproof and can be installed permanently, if desired. A time sharing adapter allows up to four different aircraft to use the same two ground transponders.
Options	A race track option allows a pilot to program a race track pattern. An X-Y preflight option allows a pilot to pre-program his initial flight path and check points prior to takeoff.

Output

The standard output is in a Serial ASCII format compatible with RS232 or Del Norte 12 V communication line

Information Retention

At least one month with all external power turned off unless the set button is pressed with the L-R mode switch in station reference or X-Y, or unless P₁ and P₂ are pressed again in the designate position

APPENDIX IV

ELECTROMAGNETIC ANOMALY LISTINGS

The following listings are largely self-explanatory. Some explanation, however, follows.

I. 735, IP, PPM, etc.

Anomaly amplitudes in ppm (parts per million) at the selected frequency (735 or 3220 Hz) for the selected component (IP = in-phase, Q = quadrature). Original amplitude assignments were in small divisions of analog. These values were converted to ppm using the average conversion factors of 3 ppm/small division for the 735 IP, 735 Q, 3220 IP and 3220 Q channels.

II. ALT.

Helicopter terrain clearance at the peak location. Bird terrain clearance is arrived at by assuming a 110 foot cable.

III. ST., DEP.

Sigma t (conductivity-thickness product or conductance) in mhos of the vertical half plane model (VHP) and depth to top of VHP model (appears as negative where model is above ground surface, i.e. bad fit).

IV. AVERAGE, ST., DEP.

Average conductance (ST) and depths (DEP) from low and high frequency

V.

COND. RANGE

Conductance range figure based on average conductance estimate (see Item IV above). Conductance range figures vary from one to nine (higher numbers for higher apparent conductance values). Conductance range figure delimiters are as follows:

CONDUCTANCE RANGE FIGURES

1	-	0	<	01	<	2.0 mhos
2	-	2.0	<	01	<	3.0 mhos
3	-	3.0	<	01	<	5.0 mhos
4	-	5.0	<	01	<	8.0 mhos
5	-	8.0	<	01	<	12.0 mhos
6	-	12.0	<	01	<	17.0 mhos
7	-	17.0	<	01	<	30.0 mhos
8	-	30.0	<	01	<	75.0 mhos
9	-	75.0	<	01	<	∞ mhos

VI.

CAT.

Category based on 735 Hz in-phase amplitude with delimiters as follows;

ELECTROMAGNETIC ANOMALIES

D
3.1 52

D-Anomaly label 3.1-Conductance (in mhos) 52-Depth to source (feet)

CATEGORY 3 (735 Hz In-phase amplitude > 10 ppm)

CATEGORY 2 (Oppm < 735 Hz In-phase amplitude \leq 10 ppm)

CATEGORY 1 (Oppm = 735 Hz In-phase amplitude)

CATEGORY 0 (either 735 or 3220Hz In-phase amplitude $<$ Oppm)

ANOMALOUS ZONE AND PEAK LOCATION

APPENDIX 5

Archive Tape Description

The following is a summary of the archive tape format containing raw and processed magnetic, altimeter and HEM data.

ARCHIVE JOB T2082.

MORGEN

MATCH AREA

JANUARY 1981

1 2400-FOOT TAPE VOLUME.

4 TAPE FILES.

3 SHEETS.

FILE	SHEET	BLOCKS	LINES
1	1	1696	1-46
2	2	2708	47-108
3	3	1049	109-155
4	T1	151	901-902

FILE FORMAT.

DFNSITY = 1600 RPT

RECFL=FR

IRFCI=240

BLKS17F=4800

DATA FORMAT.

40 FIELDS PER LOGICAL RECORD.

ERCDTC

FORMAT (4016)

DATA SAMPLING.

GENERALLY, 0.5 SECOND.

MAGNETICS, 1 SECOND.

HEM TIME CONSTANT, 0.5 SECOND.

RECORD CONTENT.

WORD	DESCRIPTION	UNITS
1	LINE NUMBER	
2	FLIGHT NUMBER	
3	FIDUCIAL NUMBER	
4	Y-COORDINATE	0.001 INCHES
5	Y-COORDINATE	0.001 INCHES
6	SPARE	
7	TIME	24 HOUR CLOCK
8	RAW MAGNETICS	GAMMAS
9-12	SPARE	
13	RAW ALTIMETER	FEET
14	RAW HEM LOW FREQ, INPHASE	MV
15	RAW HEM LOW FREQ, O.P.	MV
16	RAW HEM HIGH FREQ, I.P.	MV
17	RAW HEM HIGH FREQ, O.P.	MV

		METERS
		METERS
18	MARTIER EASTING	
19	MARTIER NORTHING	
20	FINAL MAGNETICS	0.1 GAMMAS
21-28	SPARE	
29-32	FINAL HEM	0.1 PPM
33-35	SPARE	
36	HEM QUAD MINIMUM FLAG	(0,1)
37-40	SPARE	

NOTE : DEFAULT CODE = 0

FINAL MAG FIELD CONTAINS DEFAULT UNTIL VALUE UPDATE.

ISSUED - MAY 6/81

M. CONRON, DATAPLOTTING SERVICES

NOTE: Processing of the raw HEM data involved the following steps:

- 1) First, as the HEM is recorded in mV, the raw data was converted into ppm. This was done by dividing all channels of HEM data by 3.38 ppm/mV. This constant is an average obtained from the calibration sequences.
- 2) Each flight line is then scanned for a weighted minimum point of the HEM channels. (Minimum point can sometimes be selected erroneously due to noise or slow drift on line.)
- 3) Each HEM channel is then D.C. shifted to such that this "minimum" point has the following values:

1 ppm for the 735 IP channel
 2 ppm for the 735 Q channel
 2 ppm for the 3220 IP channel
 7 ppm for the 3220 Q channel

These values represent the geophysical response expected from a 4000 ohm-meter homogeneous earth.

LEGEND

FLIGHT LINE	25 - LINE NUMBER	1300
	1300 - FIDUCIAL NUMBER	25
	— - 50TH FIDUCIAL POINT	
ROAD OR TRACK		
SURVEY BOUNDARY		
MEAN FLIGHT LINE SPACING		125, 250 METERS
MEAN SENSOR ALTITUDE		50 METERS
ELECTROMAGNETIC ANOMALIES		
D - Anomaly label	31 - Conductance < 0 mhos	52 - Depth to source feet
CATEGORY 3	735 Hz in-phase amplitude > 0 ppm	
CATEGORY 2	0 ppm < 735 Hz in-phase amplitude ≤ 10 ppm	
CATEGORY 1	0 ppm = 735 Hz in-phase amplitude	
CATEGORY 0	Either 735 or 3220 Hz in-phase amplitude < 0 ppm	
ANOMALOUS ZONE AND PEAK LOCATION
