1997 DIAMOND DRILLING
PROGRAM (SECOND)**

**MARC-ANDRÉ LAROUCHE
PROJECT GEOLOGIST**

JANUARY 1998

SUMMARY

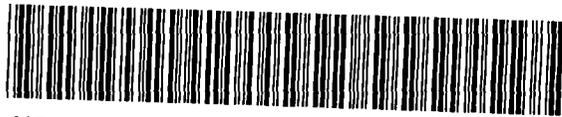

The West-Kirkland property is located in Cairo, Flavelle and Holmes Townships in northeastern Ontario, approximately twelve (12) kilometres east of the town of Matachewan.

This report describes the recent diamond drill program, which took place during the fall of 1997.

From November 10 to November 22, three (3) drill holes totalling 964 metres were completed (WK-3, 4 and 5). The three (3) holes tested the continuity of the Biralger zone (hole C-91-2: 0,7 g/t Au and 0,2% Cu over 99m). 635 core samples were sent for gold and base metal analysis. Hole WK-4, drilled southwest of hole C-91-2, returned **0,91 g/t Au and 0,15% Cu over 43,5 metres** at a vertical depth of about 160 metres, including a higher grade section of **1,74 g/t Au and 0,24% Cu over 15 metres**. Hole WK-3 and 5, drilled respectively below and northeast of hole C-91-2, intersected lower values suggesting the mineralized zone continues with a flat rake to the southwest into Norcan's ground. The mineralization does not seem to have any significant extension to the northeast, close to the surface. Considering Inmet's exploration criterias, no follow-up is recommended on the Biralger option. Because the grade does not seem to improve on the Norcan side, the acquisition of their claims is not proposed.

A positive linear correlation may be interpreted when studying gold and copper distribution curves in hole C-91-2 (previously drilled by Biralger). This positive linear correlation seems to fit in holes WK-3, 4 and 5, but only with gold values under a 200-300 ppb range. The correlation (or uncorrelation) between gold and copper is not clear when gold values are higher.

Recommendations for future work consist of continuing to test by drilling interpreted lineaments, located underneath Cobalt group sedimentary rocks (Holmes-Flavelle property). The Holmes Lake fault and I.P. anomalies in the vicinity of trench 5 (up to 900 ppb Au) and trench 9 (1,2 g/t Au over 6 metres, channel samples) should be tested by drilling as well (Chartré-Dufresne option).

INTRODUCTION

From November 10 to November 22, a diamond drilling program totalling 964 metres (3 holes) was carried out on the West-Kirkland property. The scope of the program was to test the continuity of the Biralger zone (0,7 g/t Au and 0,2% Cu over 99m), found by Biralger Resources Ltd. in 1991.

PROPERTY LOCATION AND ACCESS

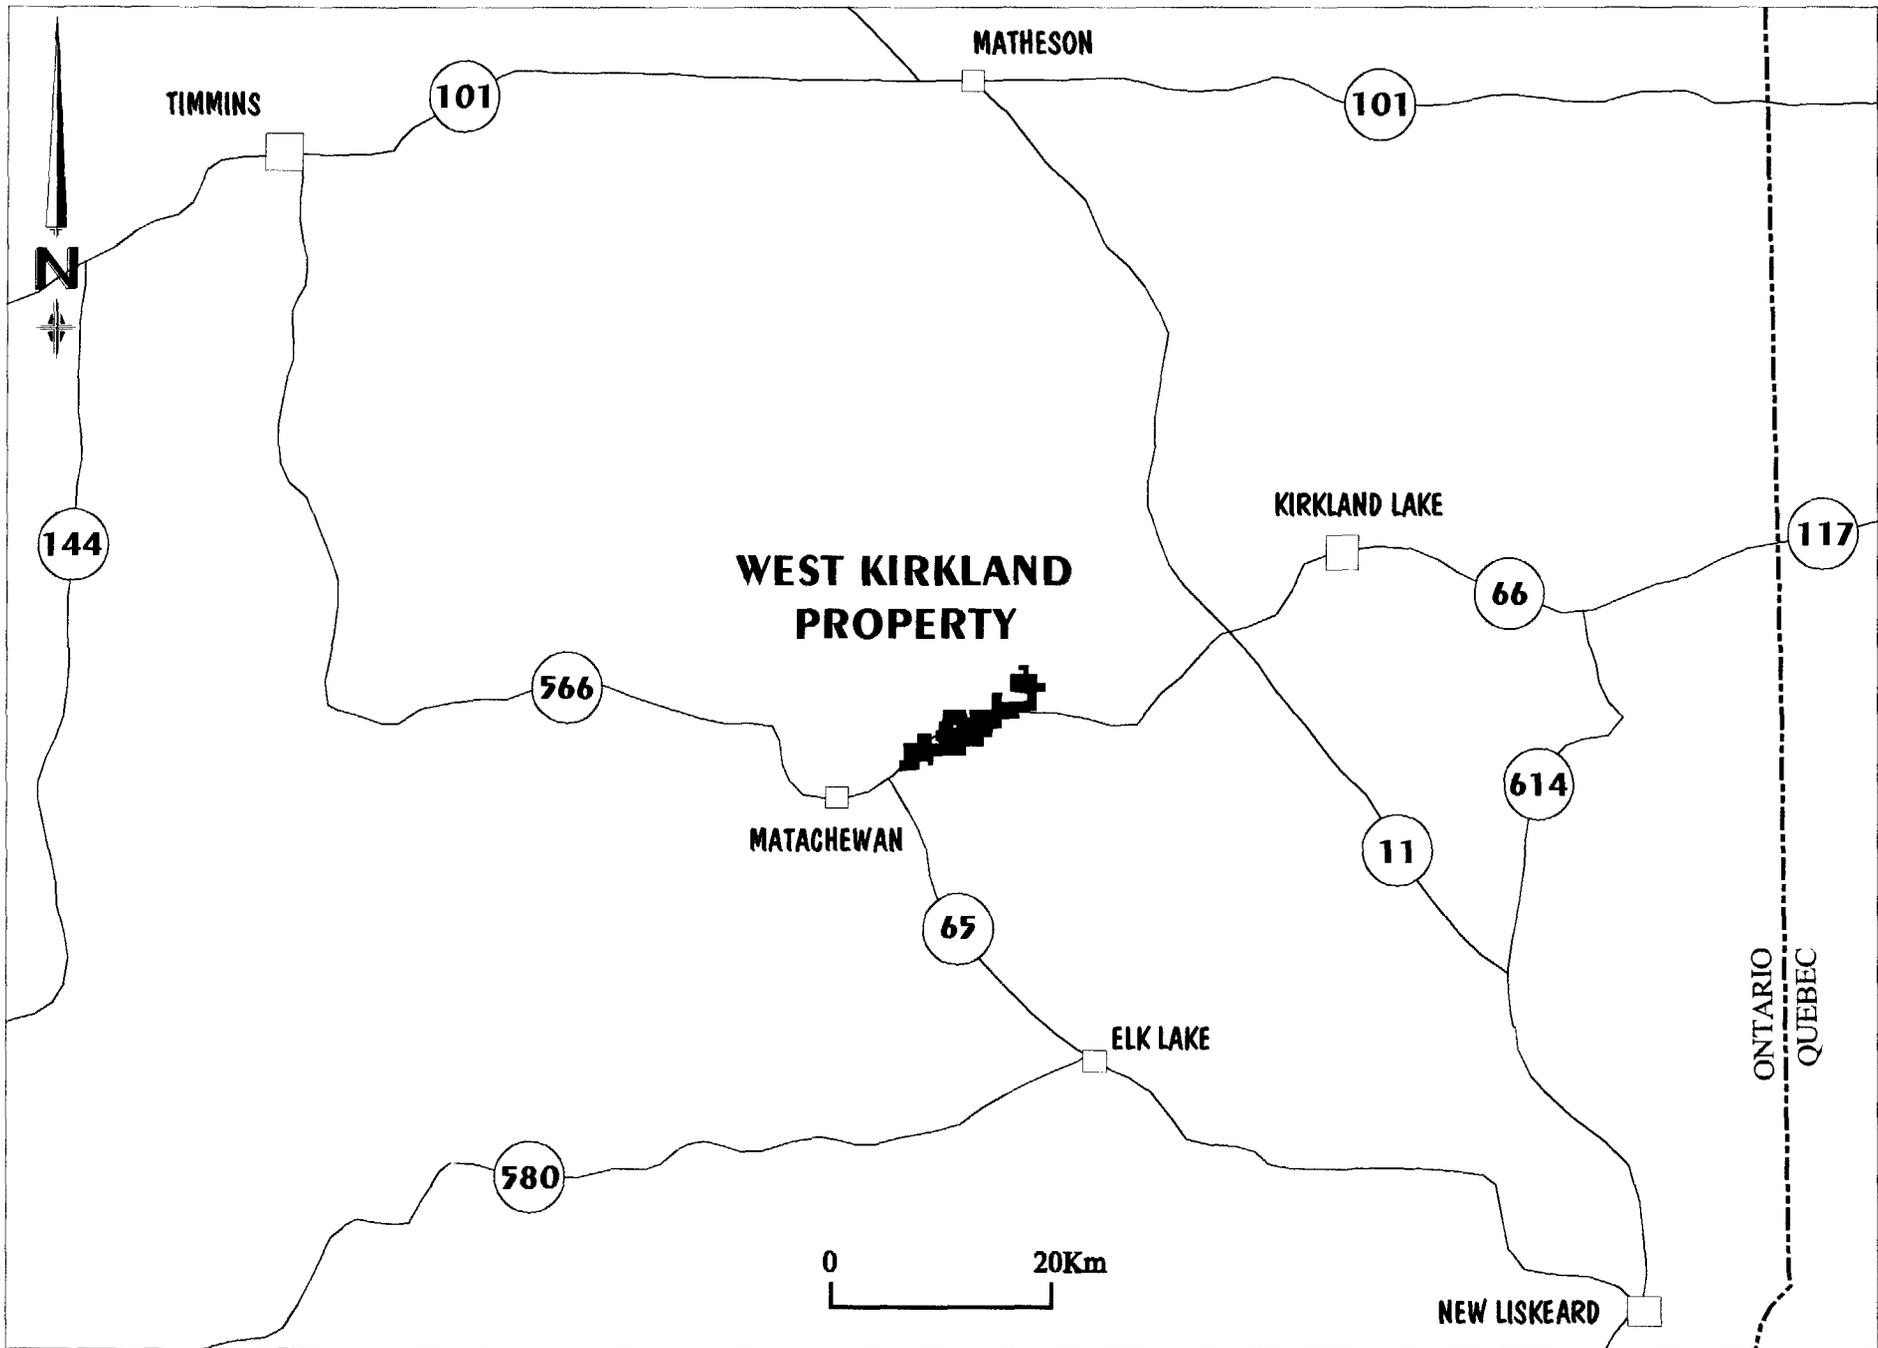

The West-Kirkland property is located approximately 12 km northeast of the town of Matachewan in northeastern Ontario (fig.1). Access to the property is provided by using Highway 66 which crosses the entire length of the property. Numerous logging roads branch from this main road, providing excellent access to the rest of the property.

PROPERTY STATUS

The West-Kirkland property consists of 81 contiguous claims (216 units), totalling 3 526 hectares, located in Cairo, Flavelle and Holmes Townships (fig. 2). All claims are 100% owned by Inmet Mining Corporation. The property was optioned from Biralger Resources Ltd., Denis Chartré and Roger Dufresne in 1995 and from Fred Kiernicki in 1996. The rest of the property was staked by Inmet.

PREVIOUS WORK

A few exploration companies and individuals have carried out exploration work on the property over the last fifty (50) years. Very little information is available at the Ministry of Northern Development and Mines office in Kirkland Lake. A summary of the work done (submitted) to date is presented in Table 1.

REGIONAL GEOLOGY (fig. 3)

The northern Flavelle, Holmes Township area was mapped in 1962 by J.C.G. Moore whereas Powell and Cairo Townships were mapped in 1964 by H.L. Lovell, at 1 inch to 1/2 mile scale for the Ontario Geological Survey (O.G.S.). The Powell Township was re-mapped in 1995 by L.S. Jensen, at 1:20 000 scale.

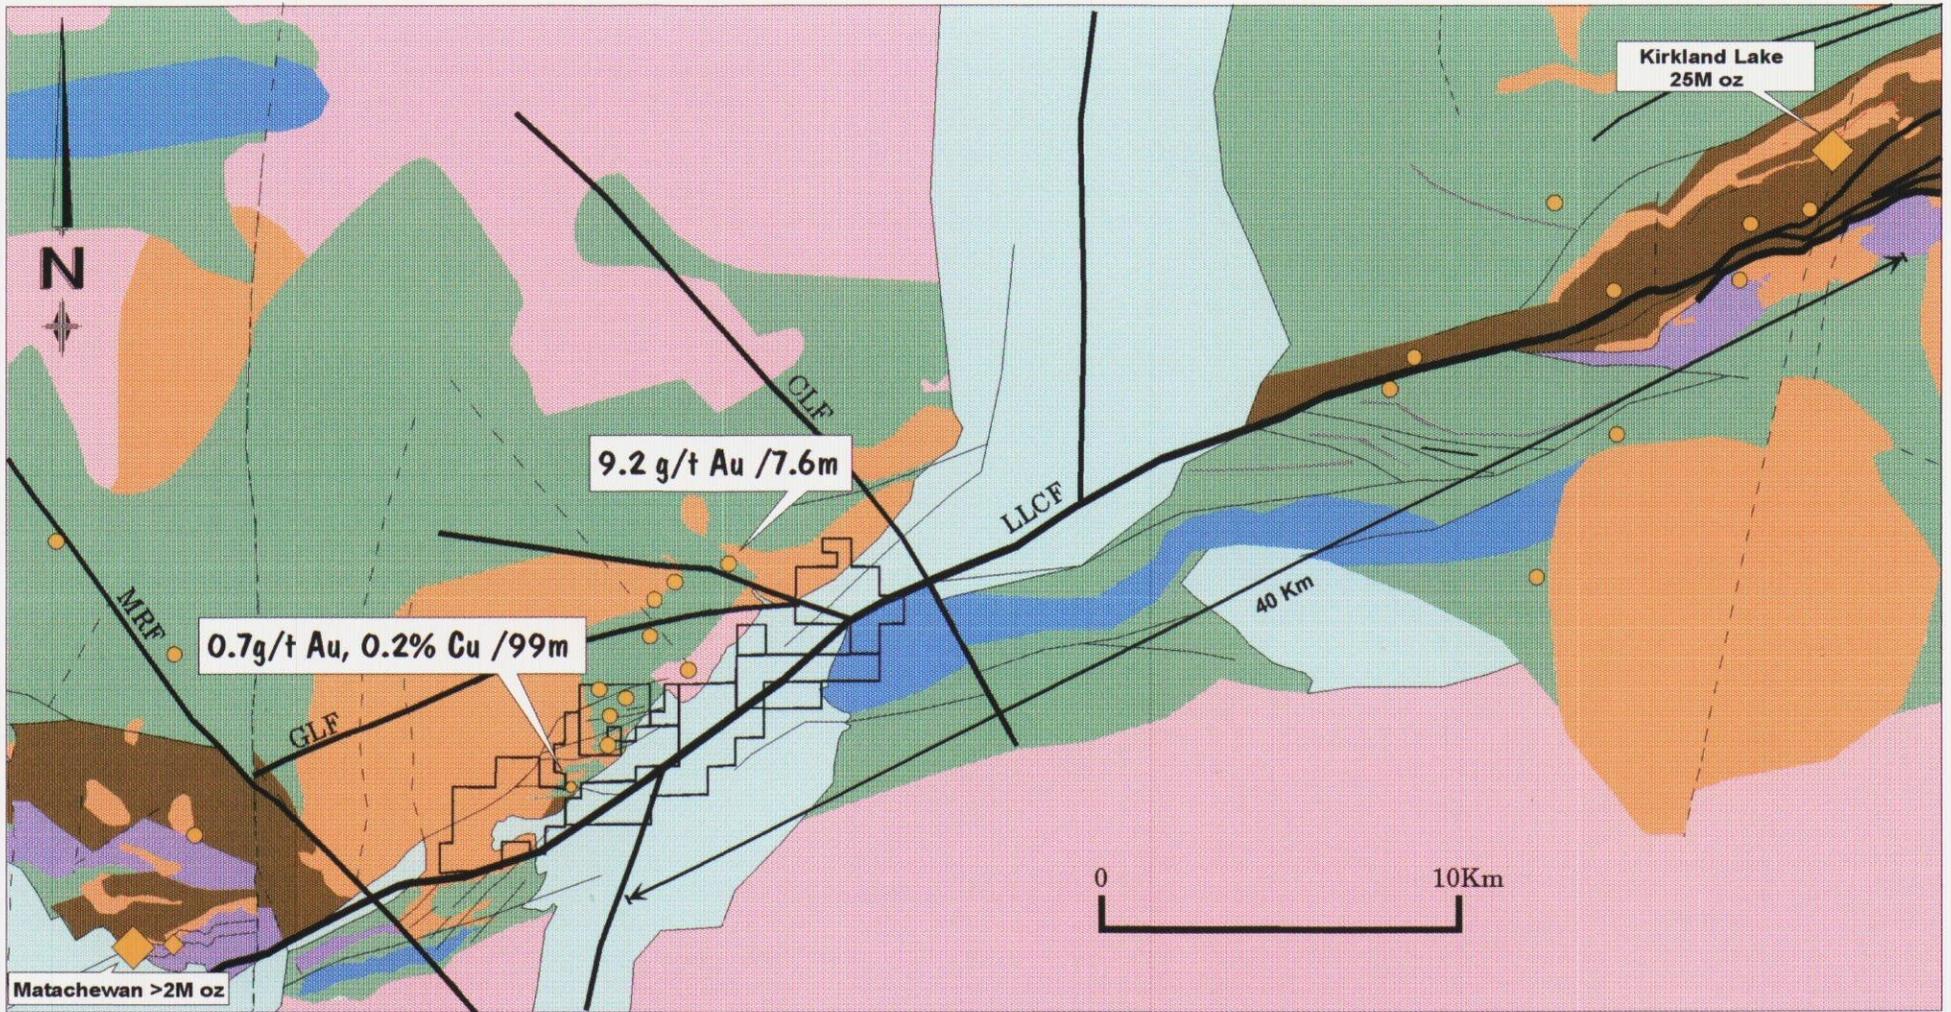

Archean ultramafic volcanics and mafic flows, minor felsic rocks, conglomerates and greywackes have been intruded by plutonic rocks and related dikes and plugs of trachytic syenite and syenite porphyry. Various syenite bodies have been identified by features affecting these major components. Belts of tightly folded sedimentary rocks trend east to northeast across Powell and Cairo townships. Most of these are conglomerates, greywackes and arkoses. They have been classified as Timiskaming age and might be correlated with the Timiskaming conglomerates of the Kirkland Lake area. All these rocks have been cut by north trending Matachewan diabase dikes. Sedimentary rocks of the Cobalt group (Huronian) unconformably overlay archean rocks in a southwest trending tongue through northern Burt Township into northern Flavelle township. Cobalt series rocks are generally flat lying.

Several faults, northeast shear zones and topographic lineaments are present in the area. Recent re-interpretations and mapping by the O.G.S. suggest that the Larder Lake-Cadillac Break (LLCB) splits into a number of individual faults or splays which could be the Galer Lake Fault, the Matachewan Fault and/or the Holmes Lake Fault. This northeast trending faults system is also defined in Holmes and Flavelle Townships by the presence of Huronian sediments (filled graben?). These faults are transected by late major regional faults of northwest trend, e.g. the Montreal River Fault and the Cross Lake Fault.

PROPERTY GEOLOGY (see appended geological map)

The Northwest of the property is underlain by steeply deeping mafic volcanics (mainly pillowed basalts) and Timiskaming type conglomerates whereas archean rocks of the southern half of the property are unconformably overlaid by sedimentary rocks of the Cobalt group. The volcanic assemblage is in contact to the west with the Cairo Stock which is a late porphyritic to trachytic syenite. The volcanics are dark green and show conchoïdal fracturing as a result of contact metamorphism due to the intrusion of the Cairo Stock. A halo of magnetite (disseminations and veinlets) is present around the Cairo Stock in volcanics and Timiskaming sedimentary rocks. This magnetite halo is interpreted as a hydrothermal alteration related to the emplacement of the Cairo Stock. The Cairo Stock is magnetic and shows pervasive hematization and, to some extent, potassic alteration. An ultramafic sill intrudes mafic volcanics to the southwest corner of the property.

East to northeast trending shear zones were mapped and/or interpreted in both mafic volcanics and syenite (Holmes Lake Fault, Matachewan Fault). Gold showings and iron carbonate alteration is associated with the Holmes Lake Fault in the Chartré-Dufresne option. Porphyry style gold/copper

mineralization is also present in the Cairo Stock close to the contact with Timiskaming sedimentary rocks and the Matachewan Fault in the Biralger option. The implications of a possible extension of the LLCB fault system through the property are the focus of our exploration efforts on this property.

1997 DRILLING PROGRAM (SECOND)

Diamond drilling contractor: Norex drilling Limited (Porcupine, Ontario).
 Samples analysis: Chemex Laboratories Limited (Timmins, Ontario and Rouyn, Québec)
 Geologist: Marc-André Larouche (Inmet).
 Technician: Gary Dunn (contract employee).

In November 1997, three (3) holes totalling 964 metres (WK-3, 4 and 5) were drilled on the Biralger option to follow-up on the Biralger zone (hole C-91-2). 635 samples were sent for gold and base metal analysis. Figure 4 shows drill holes location, the horizontal projection of the Biralger zone and surface samples taken on trench 1, in 1996.

Hole WK-3 tested the Biralger zone 75 metres below hole C-91-2 intersection (0,7 g/t Au and 0,2% Cu over 99m).

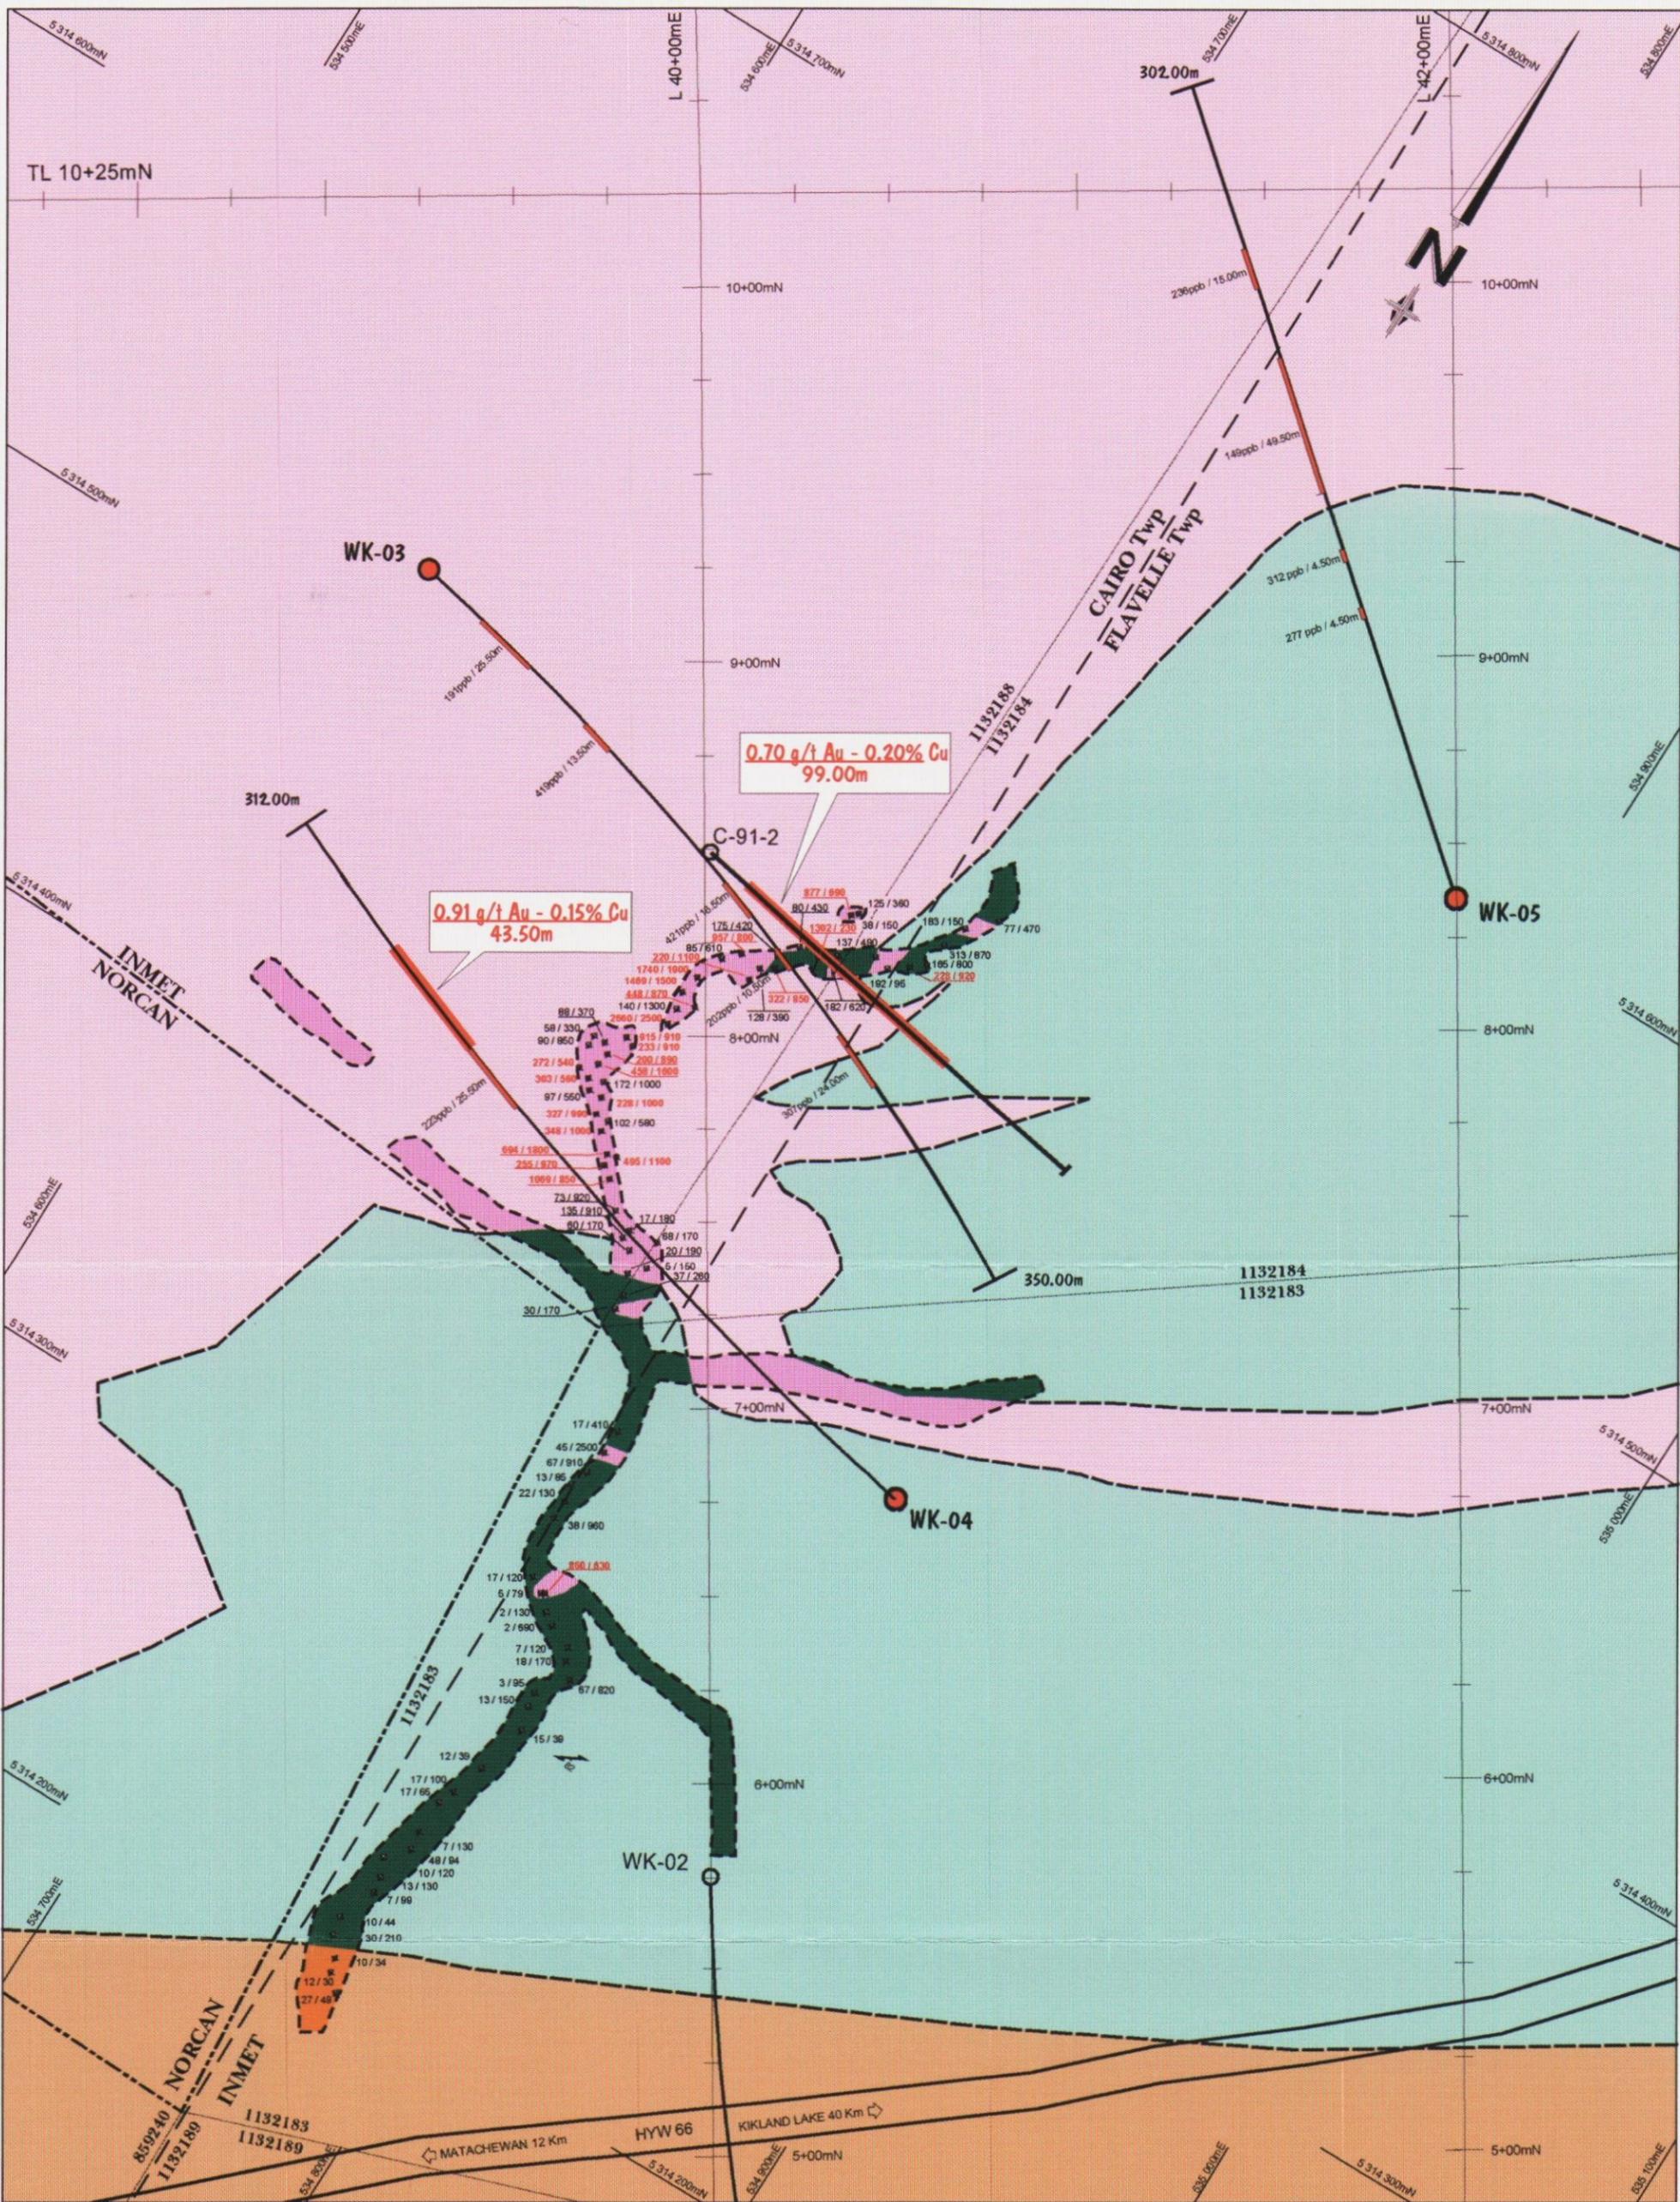

Hole WK-4 tested the Biralger zone 100m south of holes C-91-2 and WK-3 at the contact between the syenite and the basalt.

Hole WK-5 tested the Biralger zone 150m north of holes C-91-2 and WK-3 at the contact between the syenite and the basalt. Drill holes coordinates are given in Table 2. A 1:10 000 scale geological map with the location of the drilled holes is appended.

1997 DIAMOND DRILL PROGRAM (SECOND) DRILL HOLES LOCATION / CLOSE-UP TRENCH # 1

Prior to follow-up on hole C-91-2 gold intersection, partial re-sampling of this hole was done in order to verify authenticity of the 0,7 g/t Au - 0,2 % Cu zone. Six (6) samples were taken by Inmet, using the same sample footage as Biralger did (see Table 3 and fig.5). Samples were sent to XAL Laboratories of Rouyn, Québec. Results obtained by Inmet are comparable with Biralger's analysis results.

RESULTS

HOLE WK-3

This hole intersected reddish syenite feldspar porphyry and medium to coarse grained pillowed basalt. The syenite is magnetic and the texture goes from equigranular to porphyritic. The reddish tint is due to a medium/strong hematization (and/or potassic alteration?). It contains many chloritic slips. Calcite alteration is strong (veinlets and pervasive). There are many bluish quartz veins and veinlets (1-5%). The syenite contains disseminated grains and blebs of pyrite and/or chalcopyrite (generally less than 1%). Blebs of pyrite and/or chalcopyrite are often associated with quartz and calcite veins

The basalt is massive to pillowed. It is strongly magnetic. The magnetite is in the form of disseminations and veinlets. Epidote and calcite alterations are widespread. Chloritic slips are also frequent. Same disseminated mineralization as in the syenite. A few quartz veins.

A few gold bearing zones in the range of 200 to 400 ppb Au were intersected. Assays results between these zones are in the range of 20 to 100 ppb Au (see Table 4). The hole is uniformly mineralized with copper overall its length: 412 ppm Cu / 345 metres. A few short intersections, anomalous in molybdenum, were also intersected. Anomalous gold values generally fit with an increase of quartz veins percentage although many quartz veins stockworks are barren.

HOLE WK-4

Intersected lithologies are the same as in hole WK-3. The syenite contains many partly assimilated basalt enclaves. The reddish tint is due to a medium/strong hematization (and/or potassic alteration?). The absence of calcite alteration in the basalt was noticed although a strong "bleaching" is present. Magnetite alteration in the basalt is similar to the one in hole WK-3. Widespread pyrite/chalcopyrite mineralization (disseminated grains and blebs) were intersected (generally less than 1-2%, locally up to 8%) in the syenite and in the basalt. A quartz veins stockwork was also intersected (up to 7% quartz v.).

Best intersection: **0,91 g/t Au over 43,5 metres** including **1,74 g/t Au over 15 metres** (see Table 4). The hole is uniformly mineralized with copper overall its length: 802 ppm Cu / 308 metres. Anomalous gold values generally fit with an increase of quartz veins percentage although many quartz veins stockworks are barren.

HOLE WK-5

Hole WK-5 tested the Biralger zone 150 metres north of holes C-91-2 and WK-3. Intersected lithologies are the same as the ones cut in hole WK-3 and 4. Many small porphyritic syenite

dikes intrude pillowed basalt. Strong epidote alteration and calcite alteration were noticed in the basalt. Medium pervasive hematization was noticed in the syenite all along the hole. Very little sulphides were noticed (traces to 1% pyrite / chalcopyrite). Isolated quartz veins were intersected. A few gold bearing zones in the range of 200 to 400 ppb Au were intersected. Assays results between these zones are in the range of 20 to 100 ppb Au. The hole is uniformly mineralized with copper overall its length: 344 ppm Cu / 288 metres.

Detailed log records, 1:500 scale drill sections and certificates of analysis are appended.

TABLE 4

	227	242	15	236	264

DISCUSSION: GOLD AND COPPER DISTRIBUTION.

HOLE C-91-2

Gold and copper distribution curves (fig.6) show a positive correlation between gold and copper: Au peaks generally fit with Cu peaks and Au troughs generally fit with Cu troughs. Constancy of the distance between the two (2) curves suggests a constant Au/Cu ratio (linear correlation). The Au/Cu diagram (fig. 6a) illustrates these observations: a straight line (regression line) may describe the relation between Au and Cu (positive linear correlation).

HOLE WK-3

Behaviour of Au and Cu distribution curves (fig. 7) is different from the one in hole C-91-2: Au peaks still fit with Cu peaks and Au troughs still fit with Cu troughs but the Au/Cu ratio varies, as the distance between the two (2) curves varies. As shown on figure 7a, it is difficult to draw a single straight line to describe the relation between Au and Cu since scattering of dots is too high. However, a single straight regression line (drawn on fig. 7a) seems to fit well when using gold values not exceeding 300 ppb Au. This suggests a positive linear correlation between Au and Cu when Au values do not exceed 300. With higher gold grades, the correlation (or the uncorrelation) between Au and Cu is not clear.

A few molybdenum anomalies (100-250 ppm range) seem to fit with Au and Cu anomalous zones (fig.8).

HOLE WK-4

Out of the 0,91 g/t Au - 0,15%Cu / 43,5 metres zone, gold distribution in hole WK-4 is more uniform than in hole WK-3 (see fig. 9). Copper distribution is generally more uniform too. Compared with hole WK-3, Au grades are generally lower (0-100 ppb Au) and Au/Cu ratio is more constant, since the Au and Cu curves cross-cut rarely. It is of interest to notice the first thirty (30) metres are barren of gold and significantly enriched in copper (200-300 ppm). As illustrated in figure 9a, a positive linear correlation may describe the relation between Au and Cu when gold values are under 300 ppb. With higher gold grades, the correlation (or the uncorrelation) between Au and Cu is not clear.

Weak molybdenum anomalies (50-80 ppm range) are scattered uniformly all along the hole (fig.10).

HOLE WK-4

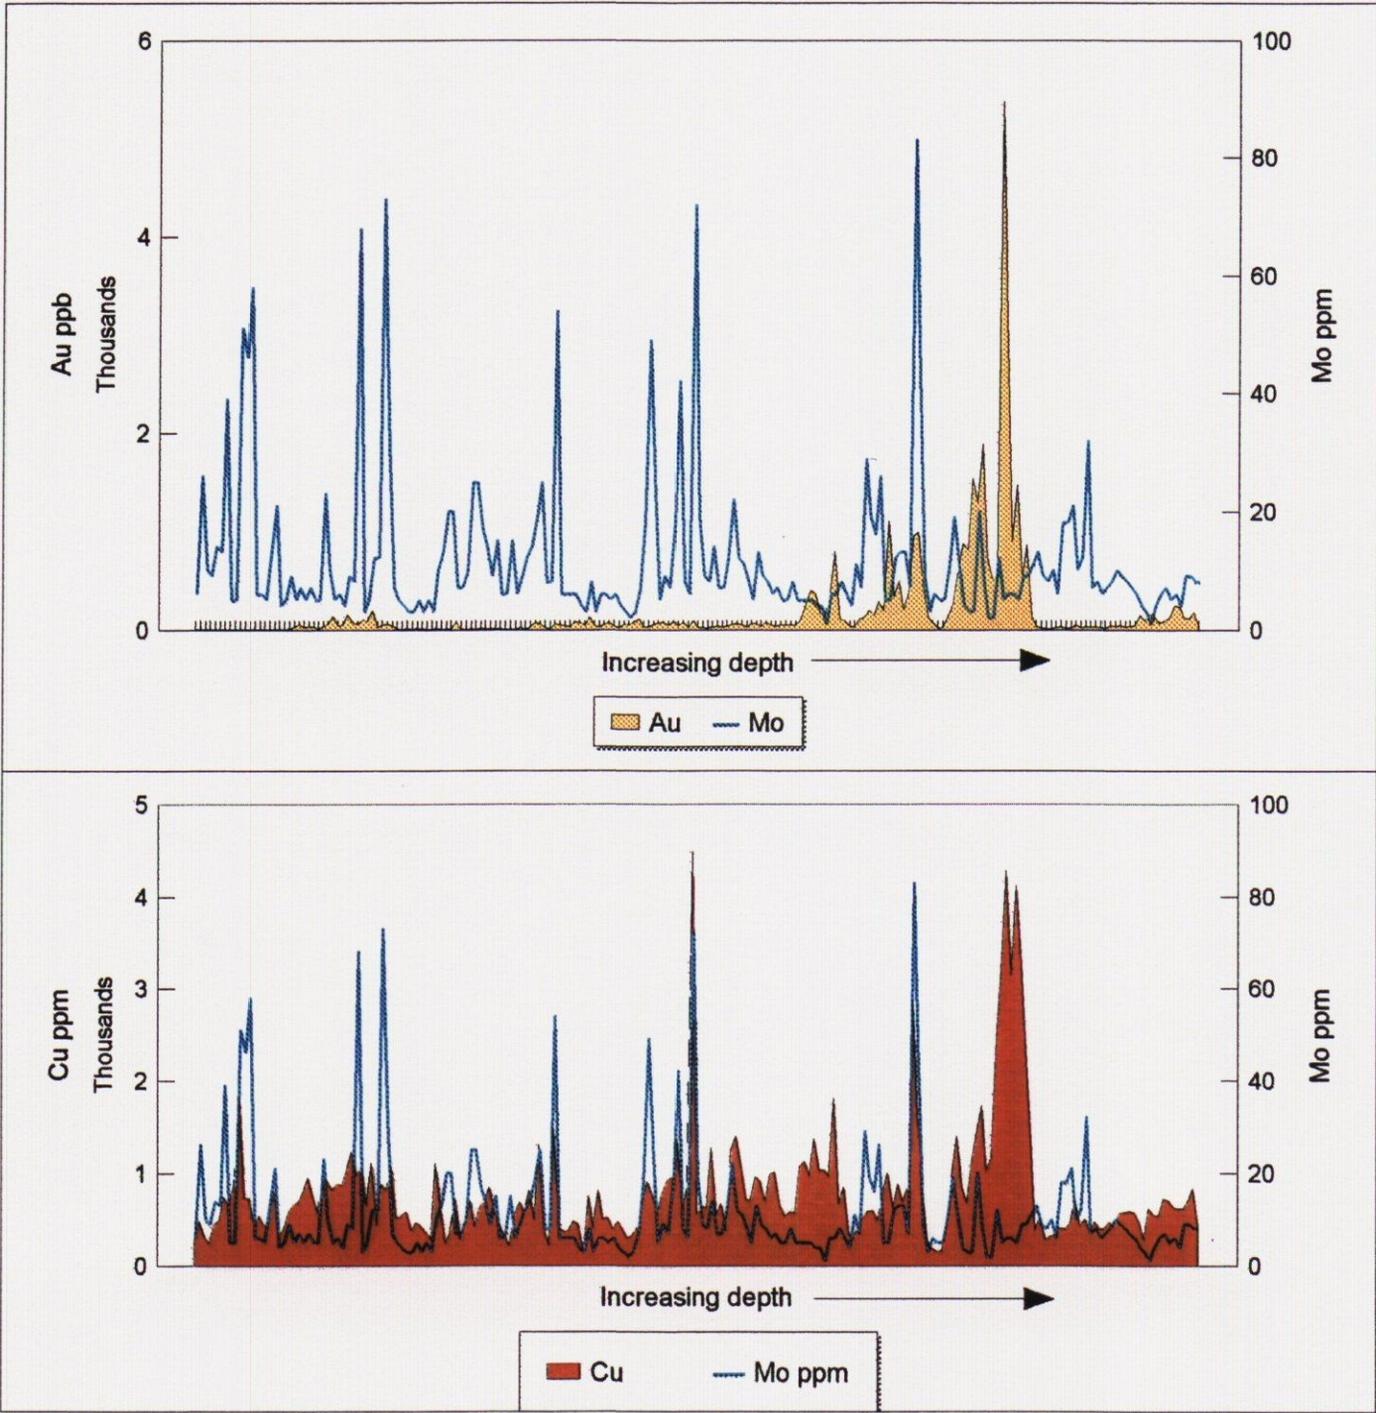

Figure10 Distribution of Au, Cu and Mo values values along hole WK-4.

Figure 11a Au / Cu diagram

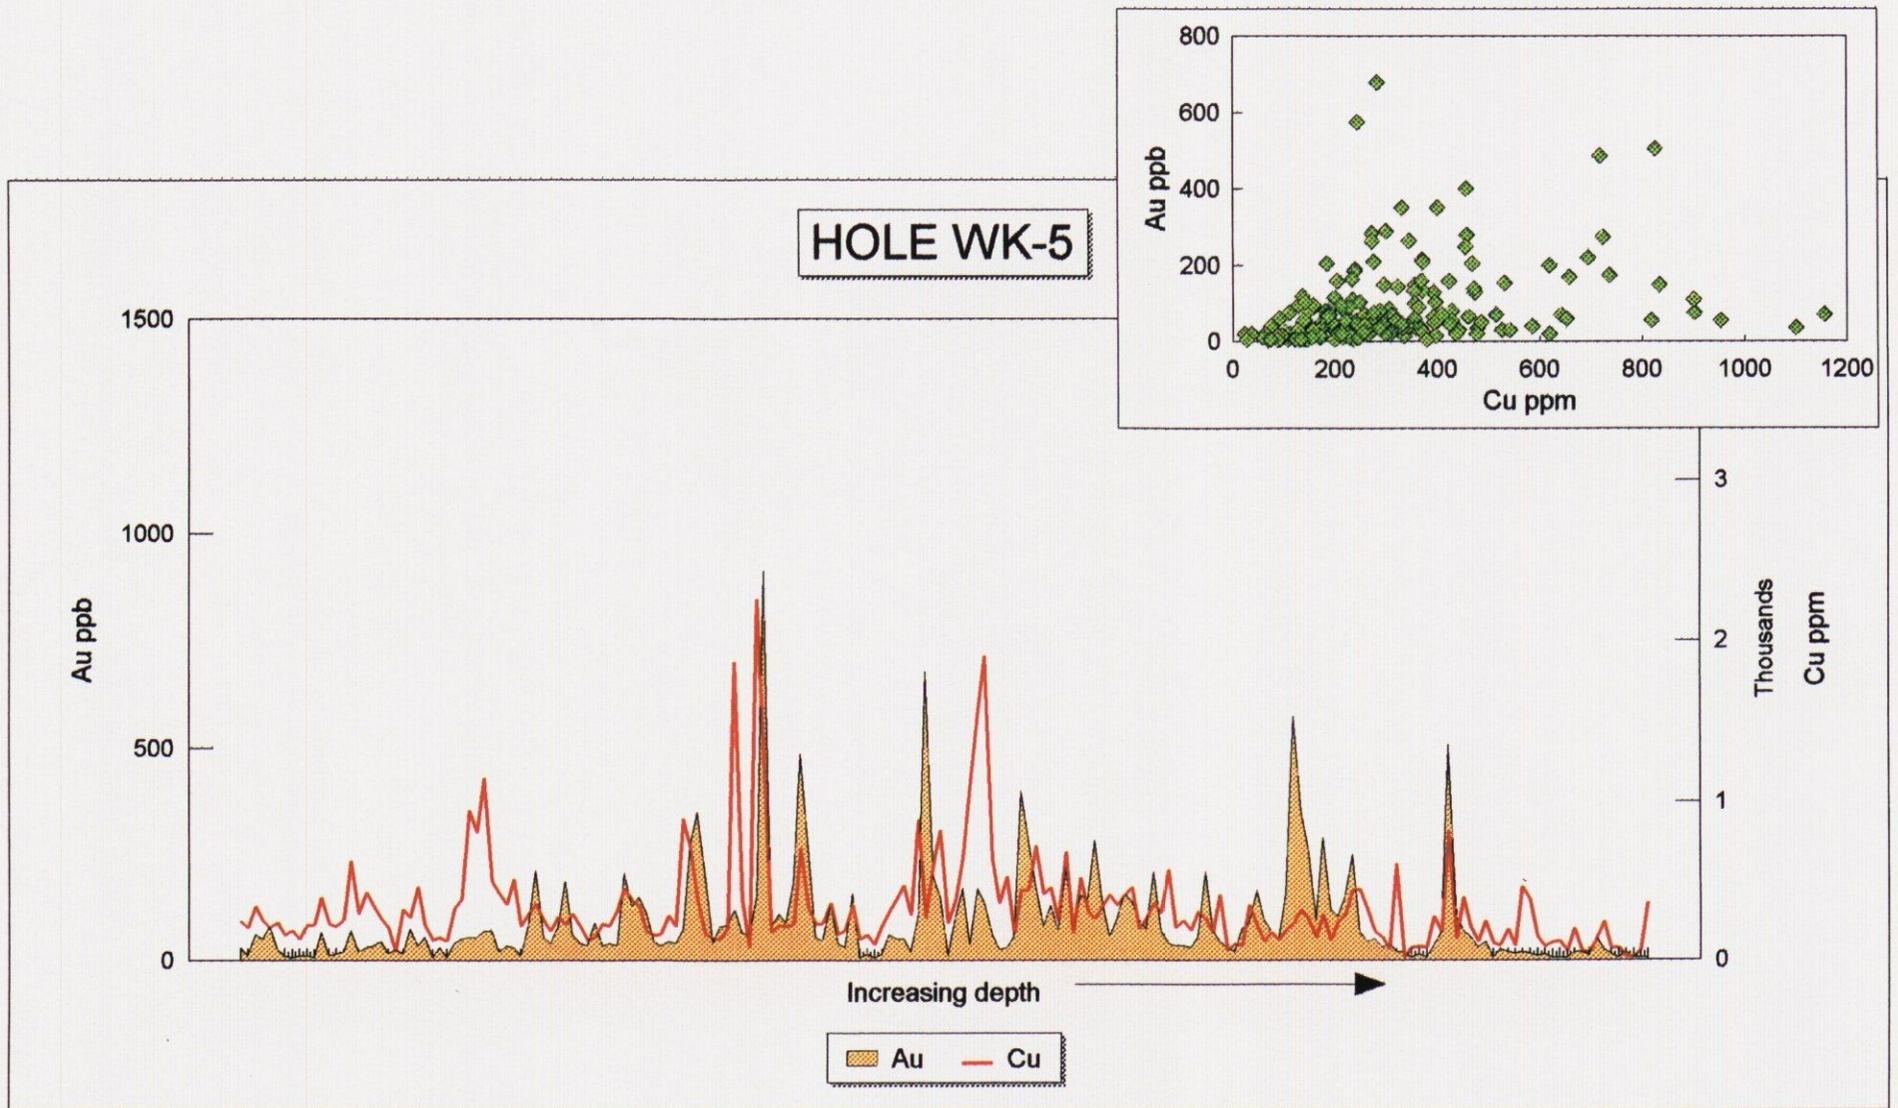

Figure 11 Distribution of Au and Cu values along hole WK-5.

HOLE WK-5

Gold and copper values are uniformly spread along hole WK-5, as shown on figure 11. Gold peaks generally fit with copper peaks and the same thing occurs with troughs. Au/Cu ratio is not constant as curves cross-cut. On the Au/Cu diagram (fig.11a), a straight regression line, indicating positive linear correlation, seems to fit well when using gold values not exceeding 200-300 ppb. With higher gold grades, the correlation (or the uncorrelation) between Au and Cu is not clear.

QUALITY CONTROL

For every seventy-five (75) samples sent, one (1) standard sample was sent for analysis in order to verify the laboratory accuracy. Table 5 compares certified values with assays results.

TABLE 5
Assays accuracy

	STANDARDS

* Used during 1997 second drilling program

** Calculated from 1997 second drilling program

HOLE WK-2: FOLLOW-UP SAMPLING

Four (4) samples were taken to follow-up on the 5,34 g/t Au / 1.5 metres intersection in hole WK-2, drilled by Inmet in June 1997(see the 1997 first drilling program). Two (2) samples were taken immediately above and under the intersection (Table 6). Gold content is insignificant.

TABLE 6**Hole WK-2 : follow-up sampling**

SAMPLE #	FROM (m)	TO (m)	LENGTH (m)	Au (ppb)
211367	588,5	590,0	1,5	<5
211368	590,0	591,5	1,5	<5
211369	594,5	596,0	1,5	70
211370	596,0	597,5	1,5	40

CONCLUSION AND RECOMMENDATIONS

Hole WK-4, drilled southwest of hole C-91-2, returned **0,91 g/t Au and 0,15% Cu over 43,5 metres** at a vertical depth of about 160 metres, including a higher grade section of **1,74 g/t Au and 0,24% Cu over 15 metres**. Hole WK-3 and 5, drilled respectively below and northeast of hole C-91-2, intersected lower values suggesting the mineralized zone continues with a flat rake to the southwest into Norcan's ground. The mineralization does not seem to have any significant extension to the northeast, close to the surface. Because the grade does not seem to improve on the Norcan side, the acquisition of their claims is not proposed.

For many reasons, the Biralger option still offer a good potential for finding low grade/ large tonnage porphyry style gold/ copper mineralization: 1) favorable lithology (porphyritic syenite); 2) presence of large deformation corridor (Matachewan Fault); 3) good location (close to former gold producing mines); 4) large areas without outcrops remain untested (surface sampling, drilling).

However, considering Inmet's exploration criterias, it is not proposed to continue exploration work on the Biralger option. This recommandation is based on the following facts: 1) the overall grade is considered too low; 2) no more surface showing left; 3) only weak I.P. anomalies remain untested.

However, it is proposed to continue to test interpreted structures (Matachewan Fault or Cadillac-Larder Lake Fault?) underneath Cobalt group sedimentary rocks, on the Holmes-Flavelle property. The Holmes Lake Fault and I.P. anomalies in the vicinity of trench 5 (up to 900 ppb Au) and trench 9 (1,2 g/t Au over 6 metres, channel samples) should be tested by drilling on the Chartré-Dufresne option.

STATEMENT OF QUALIFICATIONS

I, Marc-André Larouche of 1468 Vézina, Rouyn-Noranda, Québec do hereby certify as follow:

- I am a graduate of Université du Québec à Chicoutimi and hold a Bachelor of Science Degree in Geology (1993).
- I am presently employed on a full time basis with Inmet Mining Corporation (Exploration Division) located at 1300 Saguenay Blvd, Rouyn-Noranda, Québec.
- I have been employed as an exploration geologist on a full time basis since 1993.
- The information contained in this report was obtained on site supervision of the program and a review of all available exploration data.

Dated at Rouyn-Noranda, Québec this 30th day of January, 1998.

Marc-André Larouche
project Geologist

0.00 A 3.00	TUBE					
3.00 A 240.40	«SYENITE»	<p>3.00-240.40:</p> <p>Syénite porphyrique à feldspath, localement équi-granulaire. La teinte est orange, pâle à rose pâle. Elle contient moins de 10% de minéraux mafiques disséminés et entre 10 à 50% de phénocristaux de feldspath rose pâle de 3-4mm en général. Les phénocristaux ne sont pas toujours facilement discernables du reste de la roche. Localement, les phénocristaux forment des amas compacts donnant un aspect équi-granulaire. La syénite est généralement magnétique. Il y a beaucoup de plans de fracture chloriteux (un à tous les 10 à 20cm) à environ 45°A.c.</p> <p>Jusqu'à 50m environ, plusieurs veines de qtz de teinte blanche à bleutée (le plus souvent) à environ 70°A.C. Ces veines contiennent fréquemment des grains ou amas de cpy.</p> <p>40.50-40.70: Dyke syénitique porphyrique à feldspath. Contient 50-60% de phénocristaux de feldspath. La teinte est grise à rosée. Magnétique. Les contacts ne sont pas très nets.</p>		<p>‡3.00-240.40‡: «Calcite+++»</p> <p>Beaucoup de calcite sous forme pervasive et de veinules (souvent qtz/ calcite mais aussi sans qtz).</p>	<p>3.00-240.40:</p> <p>Pyrite disséminée et grains/amas de chalcopryrite disséminés, en placage ou le plus souvent associés à des veines de qtz.</p> <p>‡3.00-11.00‡: «1% py + cpy.»</p> <p>‡11.00-20.00‡: «1% py, < 1% cpy.»</p> <p>18.55: Veine de py, 1-2cm.</p> <p>19.20: Plusieurs amas de cpy.</p> <p>19.50: Minéral (métallique ?) rougeâtre associé à une v. qtz.</p> <p>‡20.00-26.00‡: «<1% py, <1% cpy.»</p> <p>‡26.00-38.00‡: «1% py + cpy.»</p> <p>33.20: 1 veine de py, 1cm</p> <p>‡38.00-41.00‡: «1-2% py + cpy.» Plusieurs amas de cpy associés à des veines de qtz à 38.70 et 39.60m.</p>	<p>‡3.00-5.00‡: «3%» v. qtz.</p> <p>‡5.00-8.00‡: «4-5%» v. qtz.</p> <p>‡8.00-14.00‡: «1-2%» v. qtz.</p> <p>‡14.00-18.50‡: «1%» v. qtz.</p> <p>‡18.50-20.00‡: «7%» v. qtz.</p> <p>‡20.00-26.00‡: «3%» v. qtz.</p> <p>‡26.00-29.00‡: «8-10%» v. qtz.</p> <p>‡29.00-35.00‡: «5%» v. qtz.</p> <p>‡35.00-38.00‡: «2%» v. qtz.</p> <p>‡38.00-41.00‡: «6%» v. qtz.</p>

Declaration of Assessment Work Performed on Mining Land

Mining Act, Subsection 65(2) and 66(3), R.S.O. 1990

Transaction Number (office use) W9880.00089
Assessment Files Research Imaging

41P15NE2003 2.18159 FLAVELLE 900

f subsections 65(2) and 66(3) of the Mining Act. Under section 8 of the eview the assessment work and correspond with the mining land holder. Recorder, Ministry of Northern Development and Mines, 6th Floor,

- Instructions:** - For work performed on Crown Lands before recording a claim, use form 0240.
- Please type or print in ink.

2.18159

1. Recorded holder(s) (Attach a list if necessary)

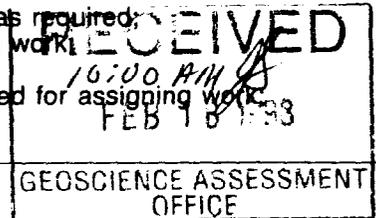

Name INMET MINING CORPORATION	Client Number 169899
Address SUITE 3400, AETNA TOWER, P.O. BOX 19	Telephone Number (416) 361-6400
TORONTO DOMINION CENTER, TORONTO, M5K 1A1	Fax Number (416) 368-4692
Name	Client Number
Address	Telephone Number
	Fax Number

2. Type of work performed: Check (✓) and report on only ONE of the following groups for this declaration.

- Geotechnical: prospecting, surveys, assays and work under section 18 (regs) Physical: drilling, stripping, trenching and associated assays Rehabilitation

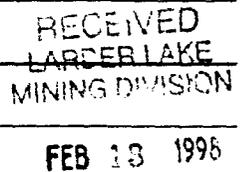

Work Type DIAMOND DRILLING	Office Use
	Commodity
	Total \$ Value of Work Claimed 54,056
Dates Work Performed From 10 11 97 To 22 11 97	NTS Reference
Global Positioning System Data (if available)	Mining Division Larder Lake
Township/Area CAIRO, FLAVELLE	Resident Geologist District Kirkland Lake
M or G-Plan Number G-3209 M-220	

- Please remember to: - obtain a work permit from the Ministry of Natural Resources as required;
- provide proper notice to surface rights holders before starting work;
- complete and attach a Statement of Costs, form 0212;
- provide a map showing contiguous mining lands that are linked for assigning work;
- include two copies of your technical report.

3. Person or companies who prepared the technical report (Attach a list if necessary)

6. Instructions for cutting back credits that are not approved

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- 3. Credits are to be cut back equally over all claims listed in this declaration; or
- 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

RECEIVED
LARDER LAKE
MINING DIVISION

FEB 13 1998

1162

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.

Dear Sir or Madam:

Submission Number: 2.18159

Status

Subject: Transaction Number(s): W9880.00089 Deemed Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. **WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.**

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice.

Please note any revisions must be submitted in **DUPLICATE** to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact Bruce Gates by e-mail at gatesb2@epo.gov.on.ca or by telephone at (705) 670-5856.

Yours sincerely,

ORIGINAL SIGNED BY
