# BASAL TILL SURVEY ORCANA RESOURCES LIMITED GRENFELL TOWNSHIP, ONTARIO, PROPERTY

#### INTRODUCTION

In much of Northern Ontario and Quebec, there is a varying depth of glacial till consisting of unconsolidated clay, sand, gravel, boulders, or a mixture of these, overlying bedrock. In many cases, a ground water percolates through the lowest or basal layer of till just above the bedrock. This ground water absorbs some of the chemical content of the bedrock, as well as the till, so a higher mineral content can at times be traced to the source by assaying a series of basal till samples.

The north one-third of the Orcana property is completely covered by overburden so prospecting would be useless. The remaining two-thirds of the property is 70% covered by overburden which makes prospecting difficult.

Geophysical instruments are useful tools for exploration purposes but not all precious minerals are associated with magnetic or conductive materials and hence the basal till survey.

#### <u>P R O P E R T Y</u>

The property consists of 13 contiguous unpatented mining claims near the south boundary of Grenfell Township in Northern Ontario. The claims are numbered as follows:

L507527 and L507528

L550941 to L550946 inclusive

L550957

L566639 and L566640

L579503 and L579504

#### LOCATION and ACCESS

The property is located approximately 9 miles west-southwest of the City of Kirkland Lake, Ontario.

Access to the property is by bush road east from Highway #11.

An Ontario Hydro power line crosses near the north boundary of the claim group and a Northern Ontario natural gas pipeline passes through the east side of the claim group in a generally north-south direction.

#### <u>GEOLOGY</u>

The property is mainly underlain by basic intrusive volcanics of Precambrian age. The volcanics consist of basalts, andesites and diorites with a steep dip to the northeast.

Some narrow porphyry dikes cross the property in a northwest-southeast direction.

The claims are on the north flank of the Larder

Lake Fault along which numerous gold and base metal occur
rences are located.

In claim 507527, several narrow, silicified, carbonate zones carrying low gold values have been located by prospecting and trenching.

Overburden covers much of the property making exploration, except by geophysics, extremely difficult.

#### BASAL TILL SURVEY

#### GENERAL

The work was done by using a Wink Vibra-Corer overburden drill. This drill produces an uncontaminated, undisturbed sample of overburden which may be visually examined and samples.

The drill is not infallible as it will not (at times) penetrate boulder beds or dry varved clays. Sand, gravel, silt or clays with a moisture content are easily penetrated and in many areas, friable bedrock can also be cored.

As this area was previously untested by this drill and it was not known if it would penetrate, this basal till survey has been in the nature of a reconnaissance survey with widely spaced holes.

In all, 17 holes totalling 234 feet were drilled in three 'fences' with holes spaced at 400 foot intervals.

Samples were taken and sent for assay from the humus layer, the basal till and in some cases between the two.

#### RESULTS of SURVEY

In the north fence containing Holes 1 to 6, Holes

1, 2 and 3 show gold mineralization in the basal till. The
same three holes gave comparable or even higher assays in the
humus layer. Holes 5 and 6 were both drilled in boulder beds
and never reached bedrock so this area cannot be ruled out.

In the second fence or tier of holes which were drilled approximately half-way between the north and south boundaries there were seven holes drilled. Holes 8, 9, 11, 12 and 13 have gold values in the basal till, with Hole 13 having the highest gold values encountered. Four of the five holes, numbers 9, 11, 12 and 13, were shallow and no separation was made for humus or basal till samples. Hole number 8 showed no gold in the humus sample.

In the south fence, with Holes 14 to 17 inclusive, only Hole 17 showed the presence of gold. However, Holes 14 and 17 did not penetrate the varved clay layer so no basal till sample was obtained.

Silver samples gave no values in any of the samples sent for assay.

#### <u>CONCLUSIONS</u>

In my opinion, this survey did not help the exploration of this property.

Partially to blame for the lack of correlation data was the reconnaissance nature of the survey, with holes spaced 400 feet apart and the fences of holes from 2,500 to 3,000 feet apart.

The holes were widely spread in order to learn if basal till samples could be obtained at various locations on the property, but only 50% of the holes were successful.

Of the seventeen holes drilled, numbers 5, 6, 14 and 17 did not reach bedrock and it is doubtful if Holes 4, 9, 10 and 11 reached the basal till.

Basal till sampling has been used successfully as an exploration tool on many properties but I would not recommend that it be continued on this property.

Respectfully submitted,

C. W. Archibald, B.A.Sc.

Mr. George J. Koleszar Mining Recorder Ministry of Natural Resources 4 Government Road East P.O. Box 984 Kirkland Lake, Ontario P2N 1A2

Dear Sir:

We have received data for Assaying submitted under Section 77(19) of the Mining Act R.S.O. 1980 for mining claims L 507527 et al in the Township of Grenfell.

This material will be examined and assessed and a statement of assessment work credits will be issued.

We do not have a copy of the report of work which is normally filed by you prior to the submission of this technical data. Please forward a copy as soon as possible.

Yours very truly,

E.F. Anderson Director Land Management Btanch
