**REPORT ON EXPLORATION
AND WORK ACTIVITIES ON
FLINSKY CLAIM PROPERTY
CLEAVER TOWNSHIP
LARDER LAKE MINING DIVISION**

2001 - 2002

BY

WILLIAM FLINSKY

and

NEIL PRYOR

LOCATION

The property is located in the northwest and central portion of Cleaver Township, District of Timiskaming, Larder Lake Mining Division. The property includes the following 45 mining claim units:

| | |
|-------------------|------------------|
| 1204131 - 6 units | 1133232 - 1 unit |
| 1180173 - 6 units | 1133231 - 1 unit |
| 1219015 - 2 units | 1169022 - 1 unit |
| 1129846 - 1 unit | 1169024 - 1 unit |
| 1129847 - 6 units | 1129879-4 UNITS |
| 1229000-8 UNITS | |

ACCESS

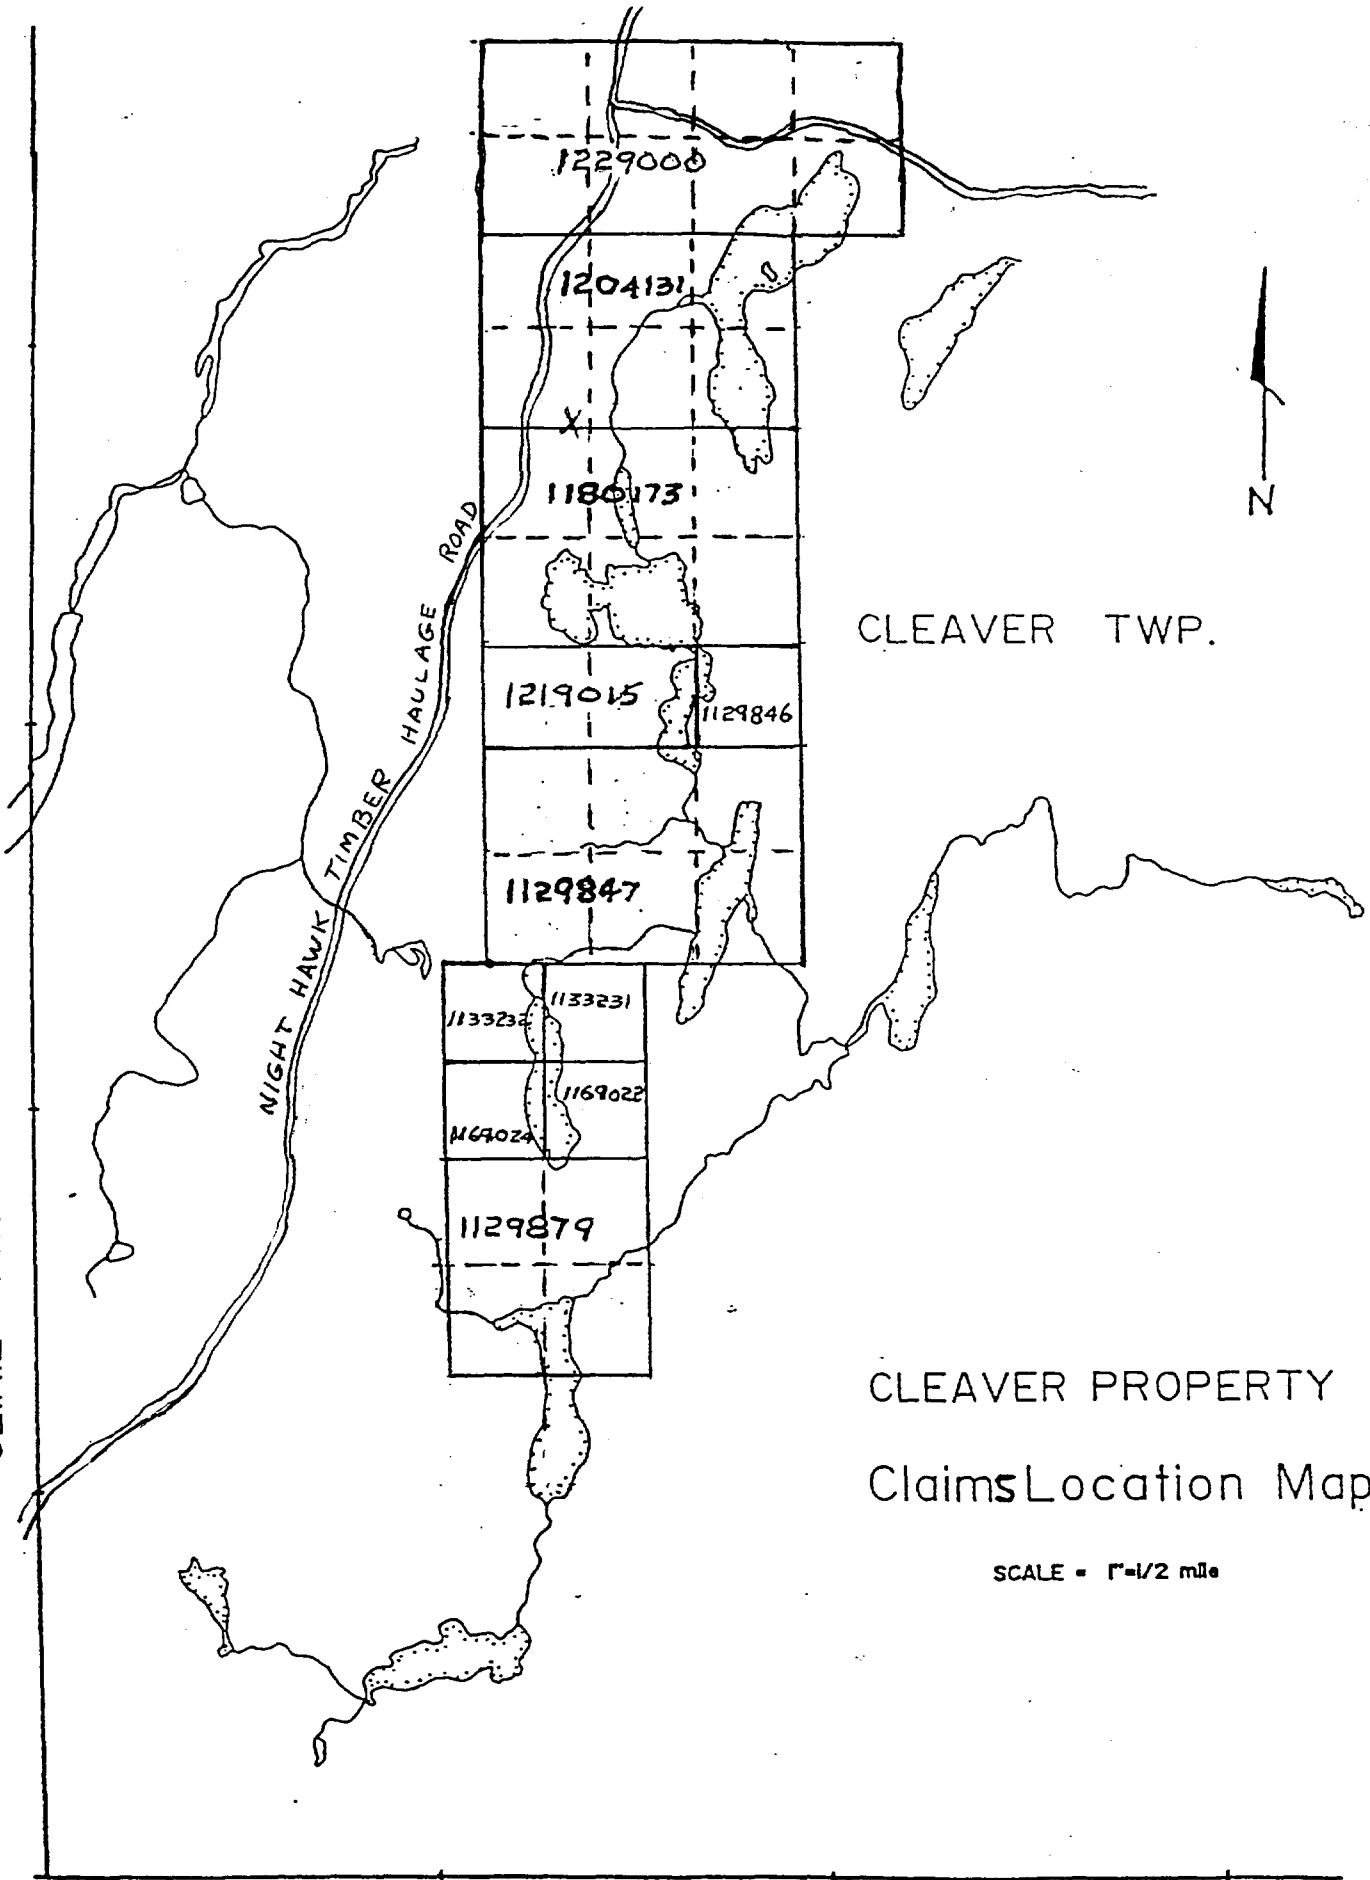

An all-weather Night Hawk timber logging road extending from South Porcupine (Timmins area) south to Cleaver Township approximately 45 km road crosses claim group 1204131 from north to southwest. A branch logging road extends east along the north end of the claim group and Little Night Hawk Lake, which is also accessible via fixed wing aircraft from South Porcupine Lake Charter Service.

REGIONAL GEOLOGY

The Cleaver property lies within the Abitibi Greenstone belt of the superior province of the Canadian Precambrian Shield. Locally, the property area is underlain by Archean age mafic and felsic volcanic rocks and younger, possibly down faulted Cobalt Group sediments along the east of the township. The Geikie Pluton, a large granodiorite intrusion, has intruded the supracrustal rocks and lies to the west covering most of Geikie Township northeast and northwest. Ultramafic volcanic rocks are intermittently draped around the stock and older calc-alkaline volcanics are locally domed up at the periphery of the stock. A north trending fault zone of regional extent lies along the Gowganda formation to the east.

A west trending fault zone in central Cleaver Township divides the area into a northern and southern geological terrain.

STRIPPING AND TRENCHING

NUMBER ONE TRENCH: Started work on claim number 1204131, 65 feet east of number (3) post, driving steel bar down to locate bedrock. Located at two feet. Blasting took place to loosen hard pack clay. Excavation took place down to clean bedrock exposing Granodiorite. More excavating took place in an east direction and still in Granodiorite trench, is now five feet long and two feet wide. Excavation is stopped and we are moving inline east 20 feet and continue further stripping overburden. Depth is down to two feet. Again, encountered Grandiorite with a pink colour.

Excavation continues for another eight feet. Trench is four feet wide at this point. A pink Hornblende Granite is found in contact with an acid lava cleaning the rock at the contact for better examination. There is some alteration at the contact and it strikes north 35 degrees west and dips 70 degrees and swings south in Granite. Work is to proceed stripping in a southwest direction along the contact with a wider trench. The acid lava probably has the greatest extent of any of the rocks on the property. This rock ridge is reported to extend south of where it is shown on the map. The lava is cut by quartz stringers less than one inch wide, mineralized with crystalline pyrite. The beep mat gave high readings on these stringers that were continuous for 15 feet. Several were found along this contract. The bedrock is dipping southwest and the overburden is too deep and many of the areas where trenching was planned were abandoned when the overburden was found to be more than four feet.

NUMBER TWO TRENCH: Prospecting in this area, a conductor was uncovered on claim number 1180173, 400 meters north of number three corner post and 400 meters east of the line post. A bar was driven down to bedrock three feet and blasted. Excavated and cleaned down to bedrock of Abitibi Greenstone. More trenching took place uncovering lesser amounts of massive to disseminated sulphide. Mineralization associated with veins of graphite. The archean bedrock consists of metavolcanic rocks intruded by ultramafic to felsic rocks. Trenching continues east to west on this conductor. Rusty acid lava with more cherty quartz exposed. A calcite vein was uncovered bearing sphalerite and galena. The vein stringers are most plentiful in a northwest strike and stripping will continue. As the beep mat is giving high readings over the conductor and is continuous, the galena vein seems to be getting wider beside the acid lava with breccia, yellow alteration.

Work is to continue along this vein as considerable calcite is found. As trenching continues, the vein width is now three inches wide. Calcite with sphalerite and chalcopyrite showing some rusty joined acid lava. A yellow alteration is seen. Trenching continues in this area.

NUMBER THREE TRENCH: Exploration was started using a beep mat because past exploration has focused on sulphide bearing bedrock geophysical conductors in the north and east parts of Cleaver Township. The area started on was claim number 1204131 from number one corner post, northeast 400 meters south to line post work started. Approximately 200 meters south of this point, a conductor was

located. Clearing of brush took place for better use of the beep mat in round circles for any response.

Bar was driven down to bedrock, two feet. Blasting took place to loosen soil and remove. This conductor lies north of a hill of cobalt sediment with a wide diabase dyke cutting across the north end of the hill. A few specks of pyrite were found in the flat lying shale. The shale is so dark that I would suspect it of being graphitic. Some of the rock is a basic lava. A few stringers with pyrite were found but failed to show any continuity and less attractive to continue stripping. A sketch of the workings enclosed.

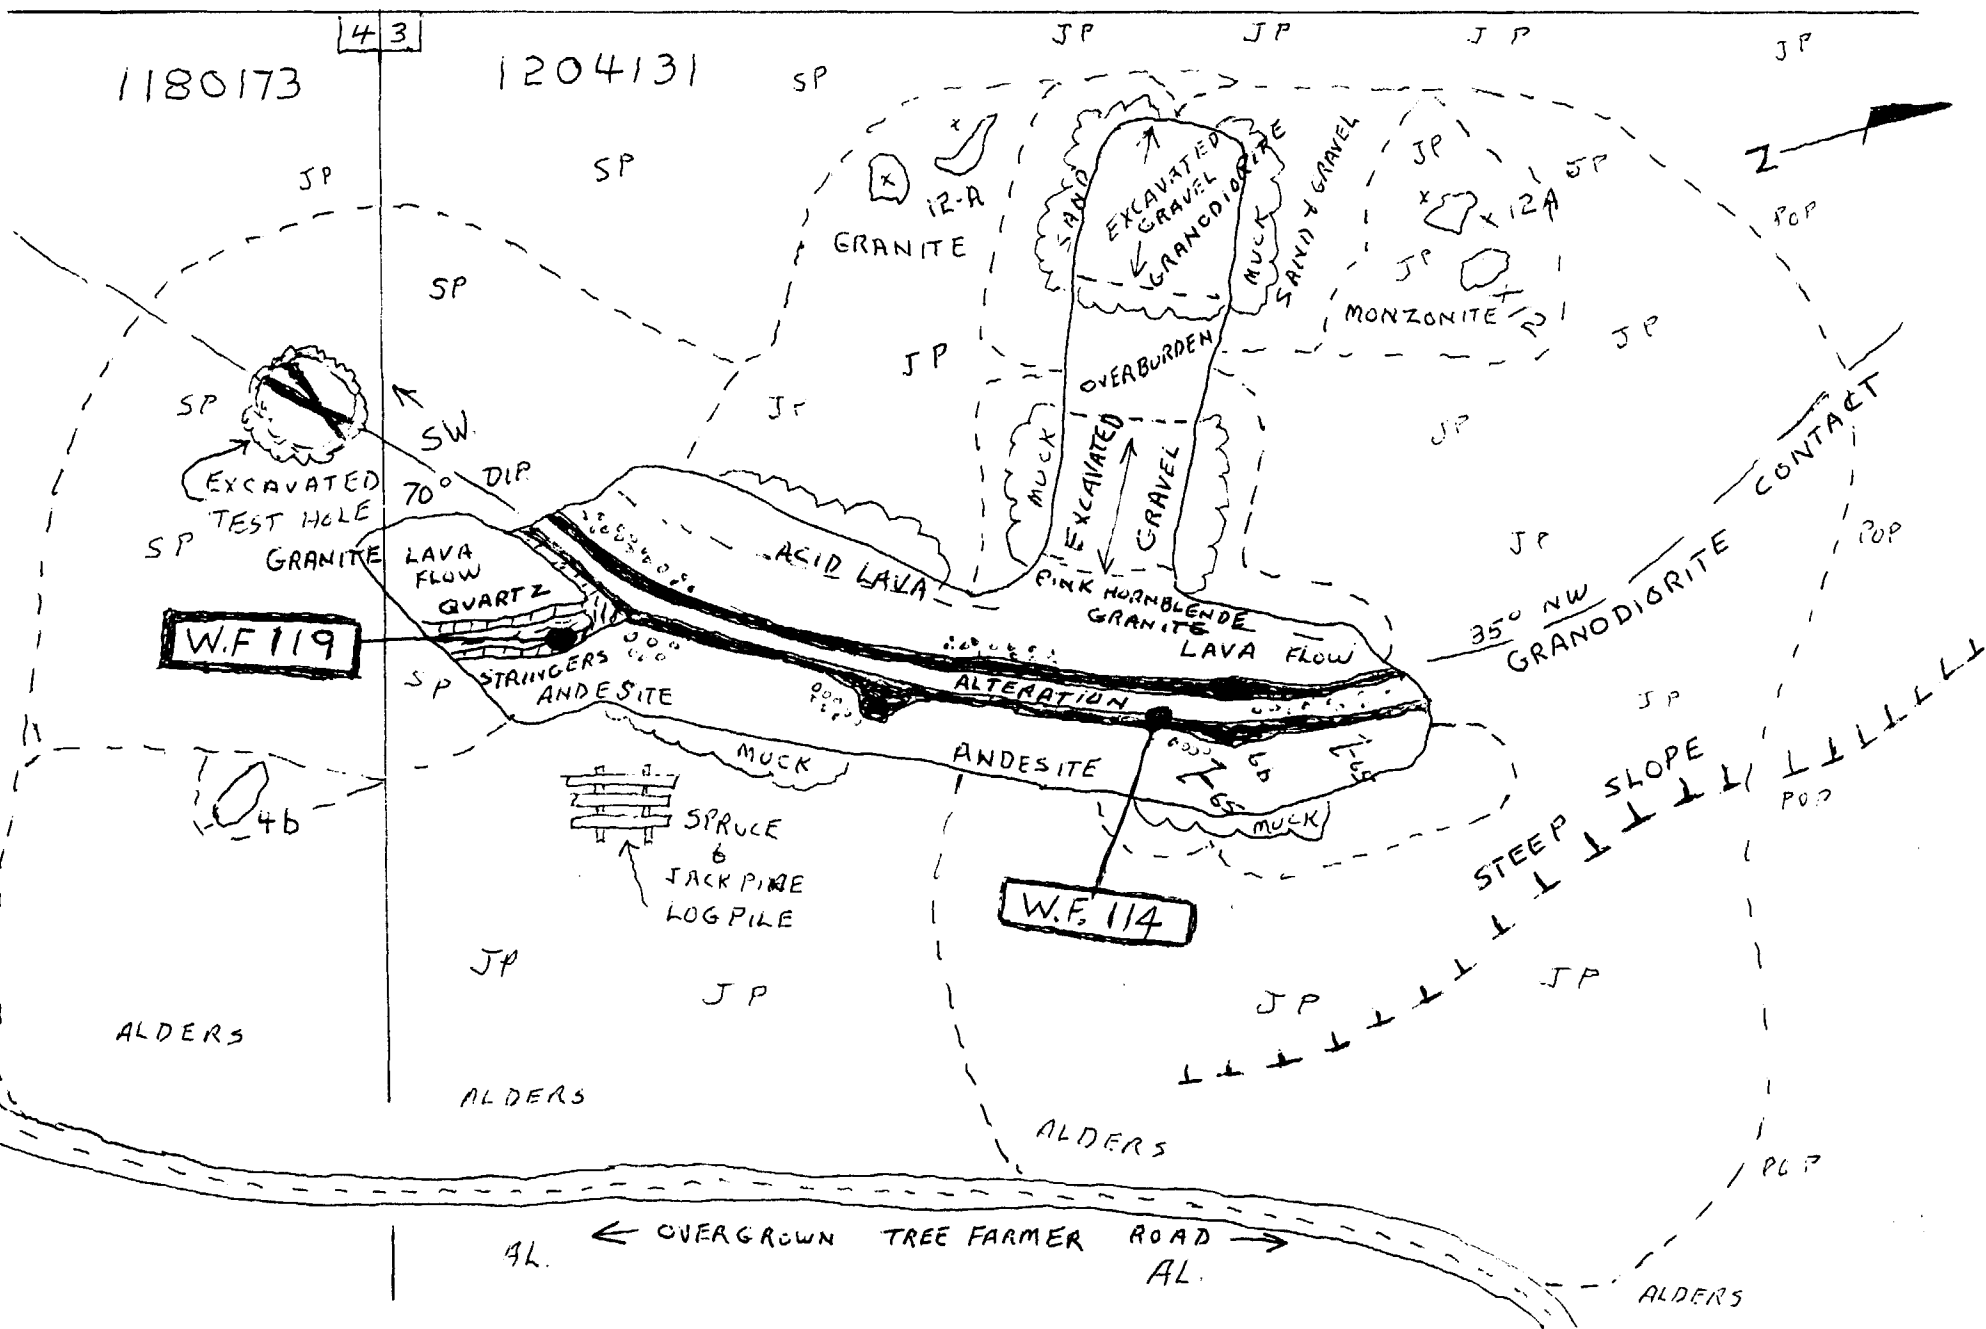

NUMBER FOUR TRENCH: Stripping and trenching is located in the southeast zone of claim number 1129879, corner post number one and approximately 300 meters southwest where excavation started. Started along a north south slope in approximately two feet of sand, clay and gravel down to bedrock, to expose a strong northeast trending quartz vein, hosting iron carbonate weathering, rhind and abundance of quartz vein material from narrow veinlets to large quartz veins five feet in width, a milky white colour spotted with hematite. The vein is being followed by excavation. Southeast direction lithologies encountered consisted primarily of mafic volcanic rocks and are generally dark green, massive, and fine grained to medium grained. The mafic volcanics have been altered to carbonate-chlorite-sericite schist in this area and other locations near the trench, being stripped east at right angles to the strike of the quartz vein. Overburden at this point is three feet and the quartz in this area is a bluish variety and is much oxidized

in the schist. Stripping continued west six feet and uncovered two narrow quartz veins. Running parallel south, the vein widths from three to five inches wide and iron pyrite, pyrrhotite and arsenopyrite, chalcoprite are also observed, arsenopyrite being common. Stripping stopped for the time being and more exploration is to take place within 100 meters square, east, west and south.

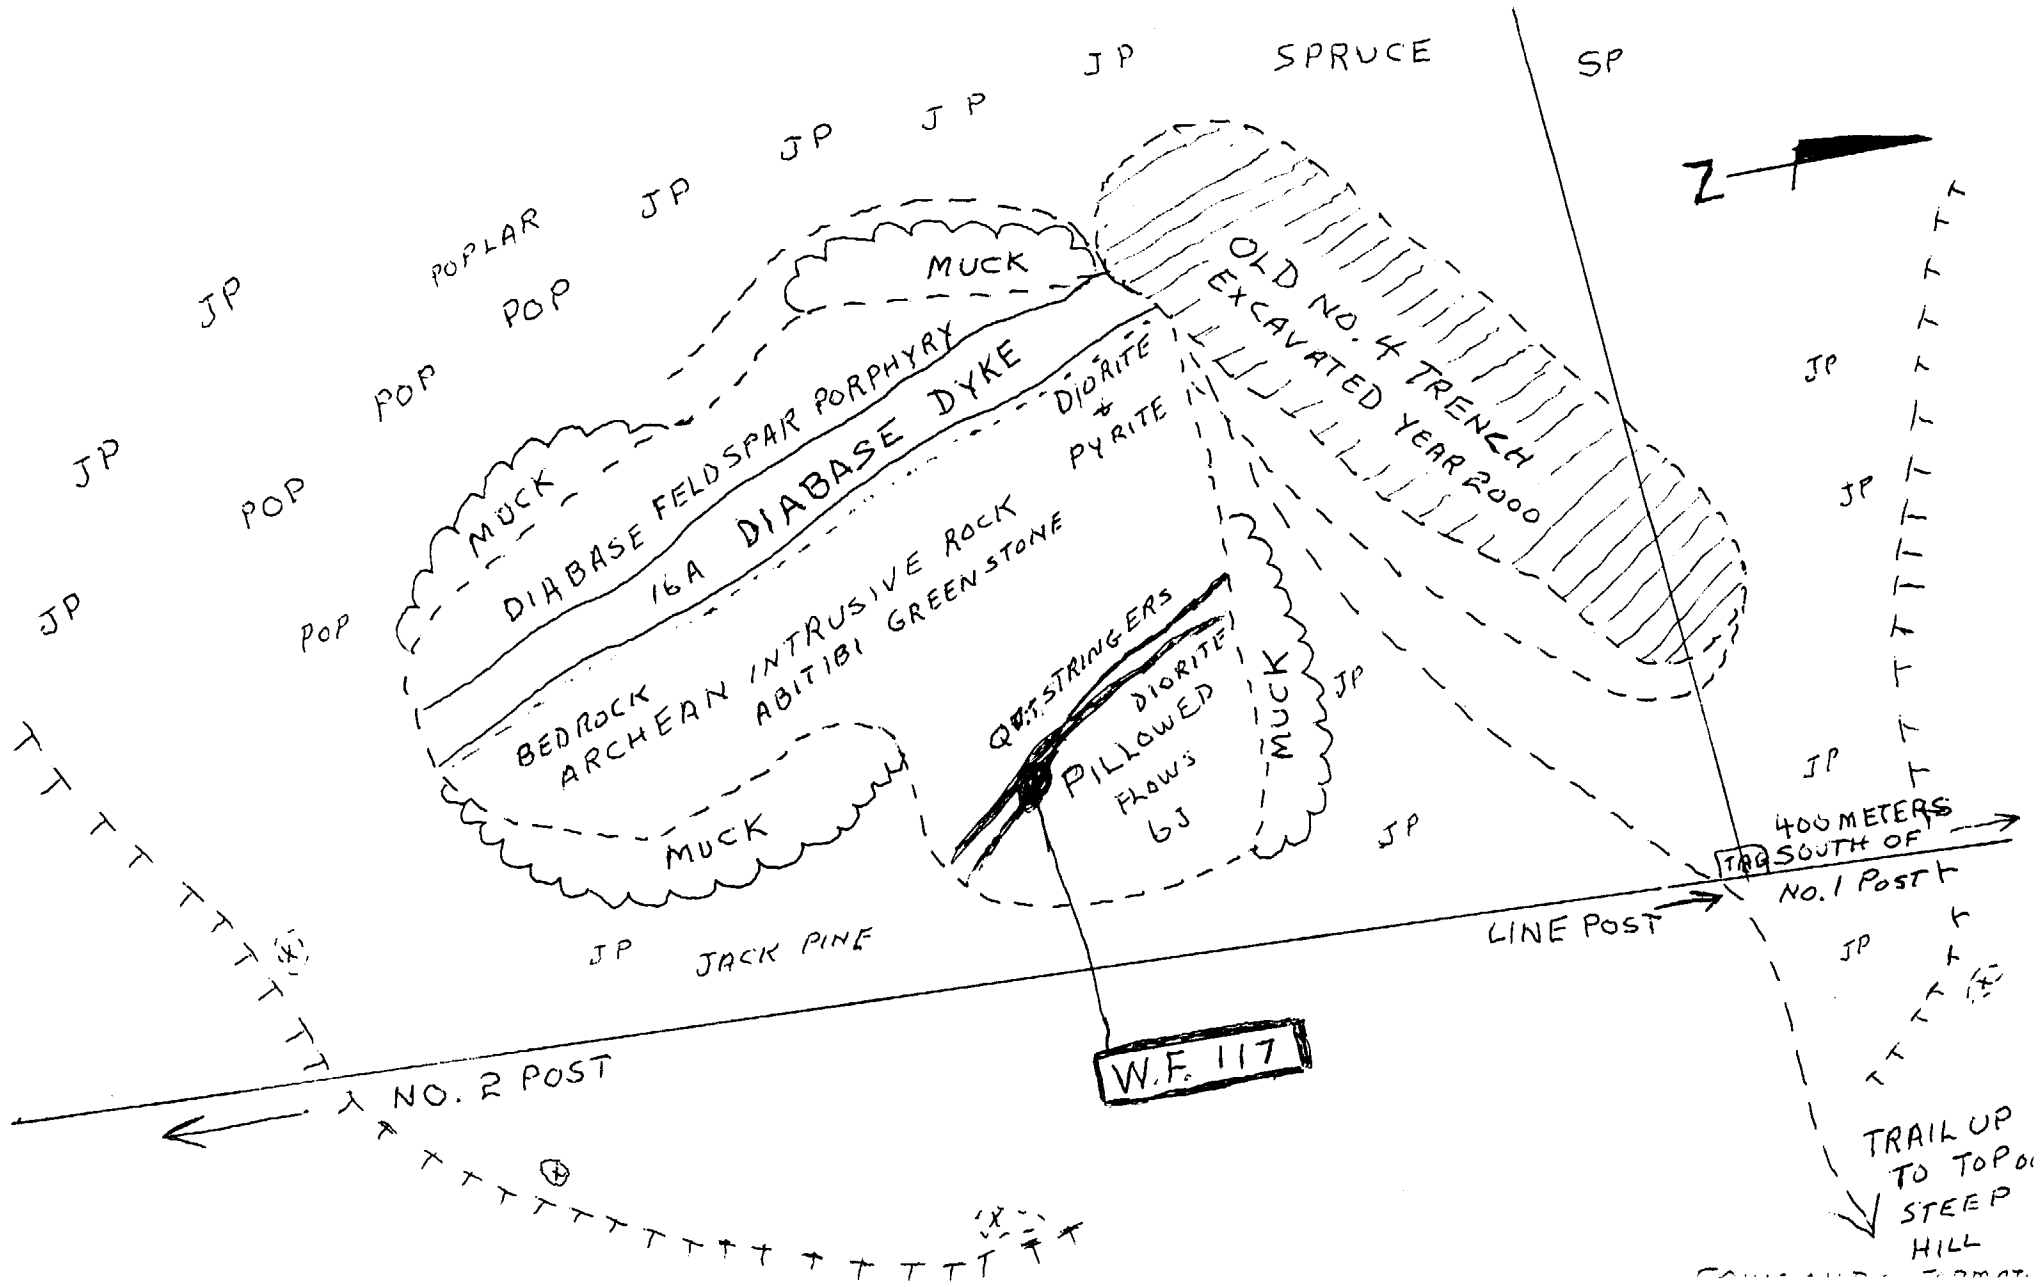

Exploration started from the trenching west 100 meters. Some outcrop was observed and uncovered a northeast striking diabase dyke. Some trenching took place. Diabase occurs abundantly in this area and cements the older formations at numerous points. Exploration continues west up on high ground into a gully with broken amygdaloidal basalt rock. Uncovering of the overburden took place down to bedrock, one foot. A schisted band of the same material is impregnated with iron pyrite and sulphides, which are oxidized to iron rust. Samples were taken, the chief interest being the possibilities of gold and silver. The work is to continue next spring.

Dear Sir or Madam

Subject: Approval of Assessment Work

We have approved your Assessment Work Submission with the above noted Transaction Number(s). The attached Work Report Summary indicates the results of the approval.

At the discretion of the Ministry, the assessment work performed on the mining lands noted in this work report may be subject to inspection and/or investigation at any time.

If you have any question regarding this correspondence, please contact STEVEN BENETEAU by email at steve.beneteau@ndm.gov.on.ca or by phone at (705) 670-5855.

Yours Sincerely,

Ron Gashinski
Senior Manager, Mining Lands Section
