JANUARY, 1986

S. TAYLOR

SUMMARY AND RECOMMENDATIONS

Horizontal loop EM, magnetic and VLF surveys were carried out over seven contiguous claims in Godfrey Township.

The horizontal loop EM survey outlined three north trending anomalies. None of these anomalies have previously been tested by diamond drilling. The strongest anomaly is on Line 3100 South at 1760 East. Anomaly width is narrow on the 444 Hz response, but much greater on the higher frequency data. This is the recommended location of a test hole, but any location along either anomaly B or C can be justified.

The magnetic results are dominated by north northwest trending linear features which are interpreted as diabase dike responses.

VLF results indicate several north northwest trending features, most of which correspond to magnetic features (ie. geological contacts), or HLEM anomalies.

INTRODUCTION

Horizontal loop EM, magnetic and VLF surveys were carried out in September and October 1985 over seven contiguous claims in Godfrey Township. These claims are located in S1/2 Concession III, W1/2 Lot 8, S1/2 Concession II, northeast corner Lot 9, S1/2 Concession II, northeast corner Lot 8 (Figure 1), N1/2 Concession II, E1/2 and southwest corner Lot 8. The following is a list of claims covered in this report:

P-833269

P-833641 - P-833643 inclusive

P-834023

P-834027

P-836903

The property is accessed via bush roads branching off Highway 576.

The geophysical survey crew included R. Daigle, B. Keen and B. Pigeon.

GENERAL GEOLOGY

The area consists of steeply dipping felsic and mafic volcanics which have been intruded by gabbroic units and north-south trending diabase dikes.

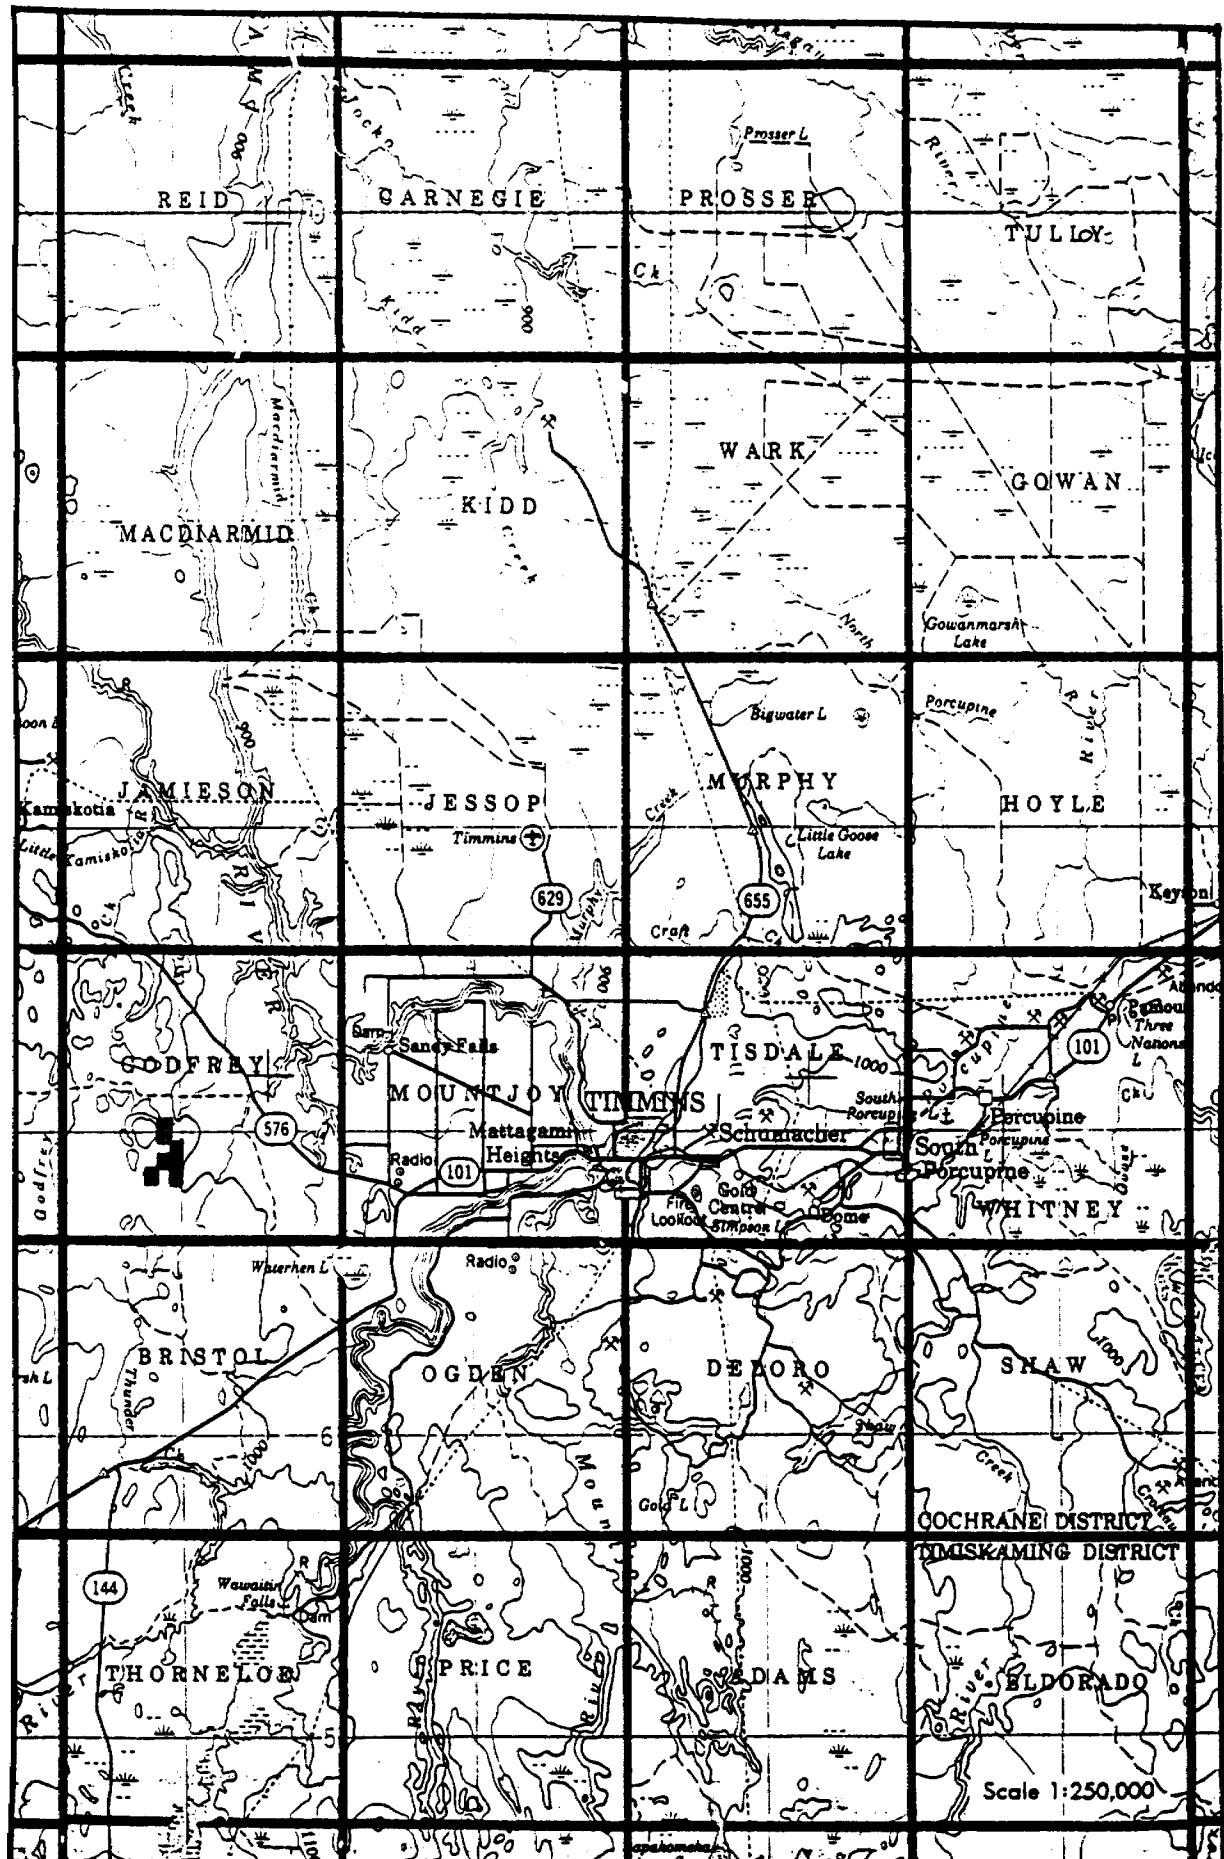

FIGURE 1: LOCATION MAP

PREVIOUS WORK

Several companies have conducted geophysical surveys over all or part of the seven claims covered in this report. These companies include Broulan Reef Mines (dip angle survey, 1955), Maple Bay Mines (EM, 1961), Utopia Mines (EM and mag, 1962; IP, 1963), Consolidated Sannorm Mines Ltd. (IP, 1963), Mespi Mines (airborne EM and mag, 1964), Tex-Sol (VLF, 1971), Conwest Exploration Ltd. (Turam, mag, AEM, 1974). The data collected in these surveys is available from assessment files in Timmins. Airborne EM (INPUT) and magnetic surveys were flown for Texasgulf Sulfur in 1981 by Questor Surveys.

In addition to geophysics, Samim mapped and carried out lithogeochemical analysis over the area in 1982.

Eight holes are known to have been drilled on these seven claims. Utopia Mines drilled four holes (two in 1962, one in 1963, one in 1964). The first three holes were drilled to test an east-west trending EM conductor. Holes were located in N1/2 of claim P-836903. All holes intersected minor pyrite; one hole intersected chalcopyrite. The fourth hole was drilled approximately 300 m north and was inclined to the east. This hole also intersected pyrite. In 1965, Consolidated Sannorm Mines Ltd. drilled an IP anomaly. The hole was collared at

approximately 2400 South 1700 East and inclined to the west. The source of the anomaly was not intersected. In 1974, Conwest Exploration Ltd. drilled a hole to test a Turam anomaly. The collar of the hole is not on the grid (approximate location 3450 South, 1700 East) but it was drilled westward onto the property. The hole intersected graphite and minor sulfides. In 1982, Samin Canada Ltd. drilled a hole collared at approximately 1870 South, 1670 West. This hole was drilled northward at -55° . Minor gold was recorded.

SURVEY DETAILS

A north-south baseline was established and crosslines were cut at 100 m intervals. Lines were picketed every 20 m (Figure 2).

The horizontal loop EM survey was carried out with an Apex Parametrics Max Min II using a coil separation of 120 m. The in-phase and quadrature components of the secondary field were measured as a percentage of the primary field. Readings were taken every 20 m at frequencies 444 Hz and 1777 Hz. A total of 459 stations were sampled along 9.52 km of line.

The magnetic readings were taken with a Scintrex IGS-2/MP-4. This instrument is a proton precession

- weak

magnetometer which measures the earth's total magnetic field to an accuracy of \pm 0.1 gamma. The diurnal drift was monitored every 30 seconds with a Scintrex MP-3 base station magnetometer located at 1600 East on Line 1700 South. The base value was set at 59,107 gammas. A total of 769 readings were taken along 13.33 km of line.

A Scintrex IGS-2/VLF-4 was used in the VLF-EM survey. Parameters measured include the horizontal field strength and the in-phase and quadrature components of the vertical field normalized to the horizontal field. The transmitter station used was Annapolis, Maryland which transmits at a frequency of 21.4 kHz. Seven hundred and seventy readings were taken along 13.35 km of line.

HLEM RESULTS

The results of a horizontal loop EM survey indicate three conductive zones striking north to northwest (Maps 1 and 2).

Anomaly A, located between 1900 and 2100 South, suggests the presence of a moderately conductive source (Table 1). The response width is narrow except on Line 2000 South at high frequency.

Anomaly B is located only on Lines 2900 and 3000 South. The source is also narrow, but of higher conductivity than

ANOMALY A: 444 Hz, 120 m COIL SEPARATION

Line	Anomaly Center	Anomaly Width	Indicated Depth	I. P Max.	O. P Max.	Response Parameter	Conductivity Thickness	Remarks
1900 S	1700 E	narrow	42m	-2	-4		4.5	assume dip = 90°
2000 S	1800 E	narrow	12m	-1	-3		1.5	very weak response
2100 S	1810 E	narrow	66m	-2	-2		11	

ANOMALY B: 444 Hz, 120 m COIL SEPARATION

Line	Anomaly Center	Anomaly Width	Indicated Depth	I. P Max.	O. P Max.	Response Parameter	Conductivity Thickness	Remarks
2900 S	1680 E	narrow	43	-8	-7		19	
3000 S	1680 E	narrow	35	-3	-6		5	

ANOMALY C: 444 Hz, 120 m COIL SEPARATION

Line	Anomaly Center	Anomaly Width	Indicated Depth	I. P Max.	O. P Max.	Response Parameter	Conductivity Thickness	Remarks
3100 S	1760 E	narrow	46m	-7	-6		19	
3200 S	1740 E	narrow	46m	-6	-6		16	
3300 S	1785 E	10 m	49m	-3	-4		7	

Anomaly A. The average depth to the conductor is 40 m (Table 2). The anomaly width appears to be greater on high frequency data, but interpretation is hindered by Anomaly C interference.

Anomaly C, located between Lines 3000 and 3300 South, is the strongest of the three anomalies, and lies at depth of 45-50m (Table 3). Anomaly width varies from narrow to 10 m on low frequency data and up to 30 m on high frequency.

None of the three anomalies have been previously tested by diamond drilling. The recommended target for drilling is Anomaly C on Line 3100 South. Conductivity is highest here and width is 30 m on high frequency data. Drilling along any part of either Anomaly B or C can also be justified, based on conductor conductivity and width calculations.

A weak anomaly is present at 2130 East on Line 2600 South in the high frequency data (Map 2). It can be seen as a weak quadrature response on adjacent lines. This anomaly appears to be stronger on the EM survey conducted by Utopia Mines, and it is possible that the conductor is stronger at depth. A PEM survey would determine if this is true.

MAGNETIC RESULTS

The results of a magnetometer survey (Map 3) indicate north northwest trending features. The linear nature of

these anomalies suggests the sources are diabase dikes. The large magnetic high, located on map 3, is a broad linear feature which could represent several closely spaced diabase dikes. HLEM Anomaly A is located on the southern flank of this anomaly. Anomalies A and B are located between two dikes. The anomalies do not appear to have an associated magnetic response.

VLF RESULTS

VLF results (map 4) indicate north northwest trending features. With the exception of a few localized anomalies, the anomalies can be correlated to magnetic features (ie. geological contact) or HLEM conductors. The results of all surveys are compiled in Figure 2.

Dear Sirs:

RE: Mining Claims P 833269, et al,
in Godfrey Township

I have not received the reports and maps (in duplicate) for Geophysical (Magnetometer, Electromagnetic and VLF) Surveys on the above-mentioned mining claims.

As the assessment "Report of Work" was recorded by the Mining Recorder on November 19, 1985 the 60 day period allowed by Section 77 of the Mining Act for the submission of the technical reports and maps to this office will expire on January 18, 1986.

If the material is not submitted to this office by January 18, 1986 I will have no alternative but to instruct the Mining Recorder to delete the work credits from the claim record sheets.

For further information, please contact Mr. Arthur Barr at (416)965-4888.

Yours sincerely,

S.E. Yundt
