SUMMARY

Mapping and lithogeochemical sampling commenced on the property July 5, 1991. To date a total of 35 days were spent mapping on the property. 145 lithogeochemical samples of representative rock types, including several carbonate zones and some gold bearing (?) quartz-carbonate shears were collected.

Geological maps were prepared at 1:10,000 and 1:5000 scale and comprise, outcrop geology, claim information, airborne and ground EM conductors from previous work, diamond drill locations from previous work etc. A 1:10,000 compilation of the First vertical derivative of government airborne magnetic data and selected information from the geological map was also prepared.

The geology comprises mostly massive rhyolite flows and voluminous quantities of Northwest-Southeast trending (120-130 degrees) pyroclastic flows, breccias and tuffs. The felsic package is the product of repeated episodes of Archean subaqueous caldera volcanism.

Local carbonate, sericite, chlorite and silica alteration are prevalent.

Genetically related mafic-intermediate intrusives occupy the eastern part of the property and probably represent part of a resurgent caldera dome.

Structurally the property is quite complex. Faults follow the main regional dyke directions and are strongly evident as offsets in the magnetic trends. Early structures that controlled volcanism are believed to follow these trends.

The main fold axes are represented by a strong East-West (95 degrees) to Northwest-Southeast (115-120 degrees) foliation. Stratigraphy for the most part dips steeply south.

At this time results of lithogeochemical sampling are not available. Final rock type classification and alteration interpretation remains pending. Classification at this time is limited to Chevron data for the central part of the property.

Outcrop textures combined with Chevron chemical data indicate a siliceous rhyolite dome with local K₂O enrichment in the central part of the property. The remainder of the felsic volcanics sampled appear rhyolitic but low in silica.

Economically mineralized zones have not so far been discovered however, the potential for a massive Copper-Zinc sulphide orebody remains excellent.

Diamond drilling by Granges, Conwest and Chevron intersected anomalous copper and zinc values in felsic tuffs/breccias in the North-West and North central parts of the property. However, drilling was done oblique to stratigraphy to intersect conductors parallel to the North-South dyke trends. The most interesting metal values are associated with a tuffaceous zone and hydrothermal breccia overlying massive felsic quartz-feldspar porphyry, a typical volcanogenic sulphide environment.

Drill core from only one drill hole has been found. An attempt should be made to find the 1988, Granges core, as this would provide additional geological information prior to further exploration drilling.

Outcrop in the Northeast corner of the property should also be mapped to provide additional geological and geochemical data.

An initial exploration program of linecutting, overburden drilling, and 2000 metres of diamond drilling accompanied by down-hole geophysics is recommended to test the above sulphide trend. This program will cost approximately \$375,000.

INTRODUCTION

At the request of Michel Gilbert of Cambior Inc. of Val D'Or, Quebec, White and Associates mapped and sampled the Four Corners property in Turnbull and Carscallen Townships, east of Timmins, Ontario and prepared this report.

Mapping commenced on the property on July 5, 1991. Approximately 35 days were spent on the property. Mapping was done by M. White and R. Sproule. R. Norman assisted with the mapping and sampling for 9 days. Two days were spent using an ATV trying to access outcrop in the Northeast part of the property. This attempt was unsuccessful due to poor terrain conditions.

Apart from the upper Northeast corner most of the outcrop on the property was map and sampled. Outcrops were located from previous work in the area and tied into previously cut lines and to claim lines.

The 1985 Chevron grid was found adequate for mapping however, considerable time was spent locating old pickets. A hip chain was used to measure from known picket locations. Outside the area of the old Chevron grid a (ProNav GPS 100) satellite positioning device was used to locate larger outcrops. These were tied into outcrop locations mapped by previous workers (Esso, etc.)

Maps have been prepared from field information and all available data from the assessment files, at 1:5000 and 1:10,000 scale.

Dykes and structures have, for the most part, been interpreted from the regional aeromagnetic data.

This report is based on mapping, interpretation of previous geological work and interpretation of government aeromagnetic data, Thematic Mapper satellite data and available airborne and ground EM data.

LOCATION AND ACCESS

The property comprises 1640 acres in 101 claims located in Turnbull and Carscallen Townships. Location and claim numbers are indicated on Fig. 2. The property lies 20 km west of the city of Timmins (Fig: 2)

Access is available by a gravel logging road that runs north from highway 101 and traverses the centre of the property.

A forestry skidder trail that traverses up to 2 claims north of the gravel road is the only other access. Trails outlined of earlier maps and Topo sheets no longer exist.

PREVIOUS WORK

Mapping and prospecting commenced in the general property areas as early as 1912 (ODM Reports 1912, 1927).

In 1952, Kennco Exploration performed mapping and sampling within the property area. Low gold and copper values were reported.

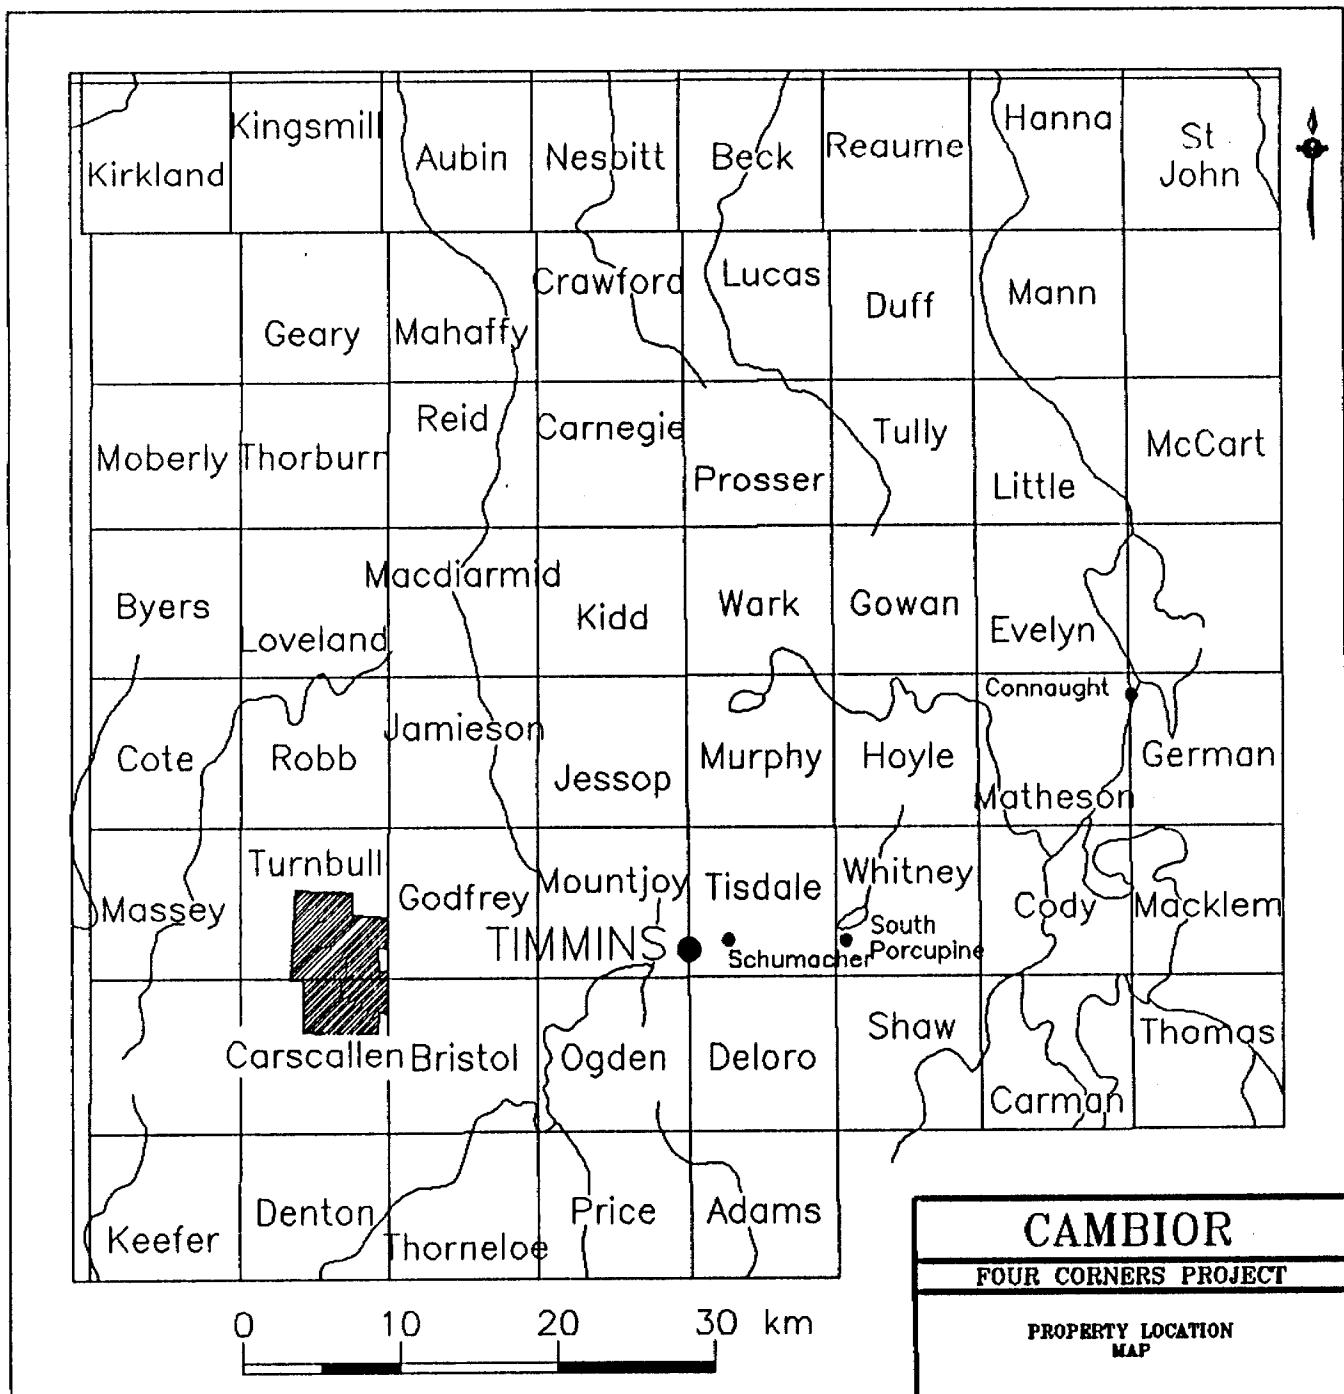

In 1962 Alsof Mines Ltd. mapped the property. Gold values ranging from 0.36 to 0.5 oz/ton Au in narrow quartz veins were reported.

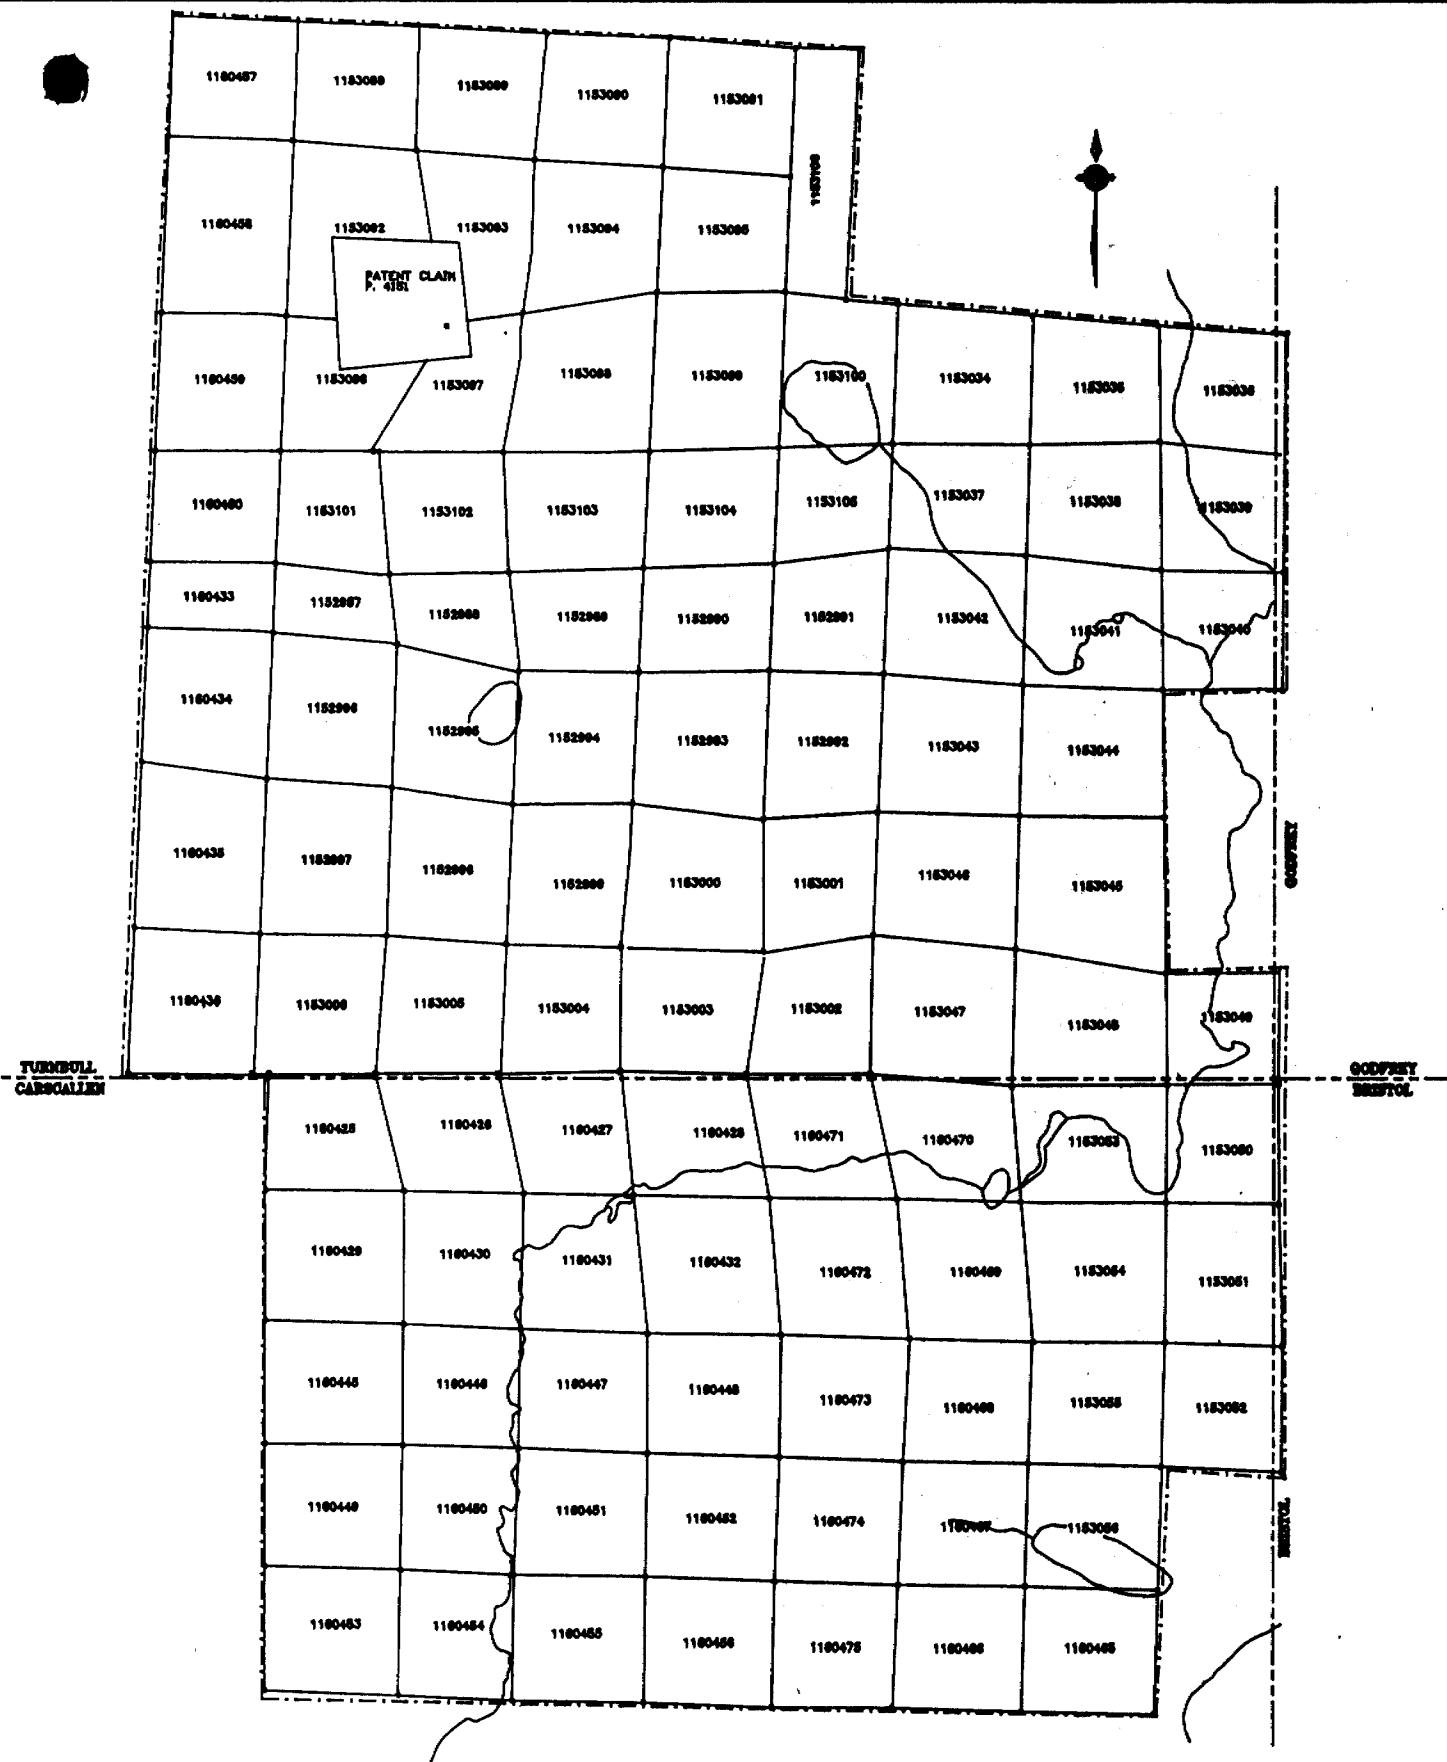

In 1965 Larchmont Mines performed mapping and geophysical surveys within the property area. Two holes were drilled immediately east of the Northeast corner of Carscallen Township with low Au values reported.

Between 1974 and 1976 Conwest performed exploration for massive sulphide within the property area. Airborne anomalies at the North west boundary of the claim block and in the North central part of the property were tested by 4 diamond drill holes. All holes intersected sulphide mineralization. Hole #3 intersected 79 feet of anomalous Cu (250-3300ppm). Hole #4 intersected 4 feet of 1300ppm Cu.

In 1984-1985 Chevron Canada Resources acquired an interest in a group of claims covering part of the property area.

Chevron comissioned a 2 direction Airborne Mag and EM survey, followed by linecutting, geological mapping, lithogeochem survey, a limited soil geochem survey and drilling of 2 DDH.

CAMBIOR

FOUR CORNERS PROJECT

**CLAIMS LOCATION
MAP**

The diamond drilling was done in the vicinity of Conwest's hole #5, and intersected massive and disseminated sulphides, exceeding 1% Cu-Zn.

In 1986 Esso Resources optioned a group of claims in Northeast Carscallen Township. The work undertaken by Esso consisted of linecutting, geological mapping, ground Mag, VLF and diamond drilling. No significant assays were reported.

In 1988 Granges Exploration Ltd. optioned a group of 37 claims in Southwest Turnbull Township. Two small grids were cut on the property and horizontal loop EM survey and diamond drilling were subsequently carried out.

A total of 6 diamond drill holes were completed. Two were collared on an old gold showing, with no results, and the remainder were spotted in the vicinity of Chevron's 2 diamond drill holes. Anomalous copper and gold values were reported.

REGIONAL GEOLOGY

Apart from the Timmins gold camp, outcrop areas and within the immediate area of massive sulphide deposits the geology of the Timmins area is very poorly known. Government geology maps are outdated and even though core from thousands of drill holes is stored in the Timmins Core Library this information has not been compiled.

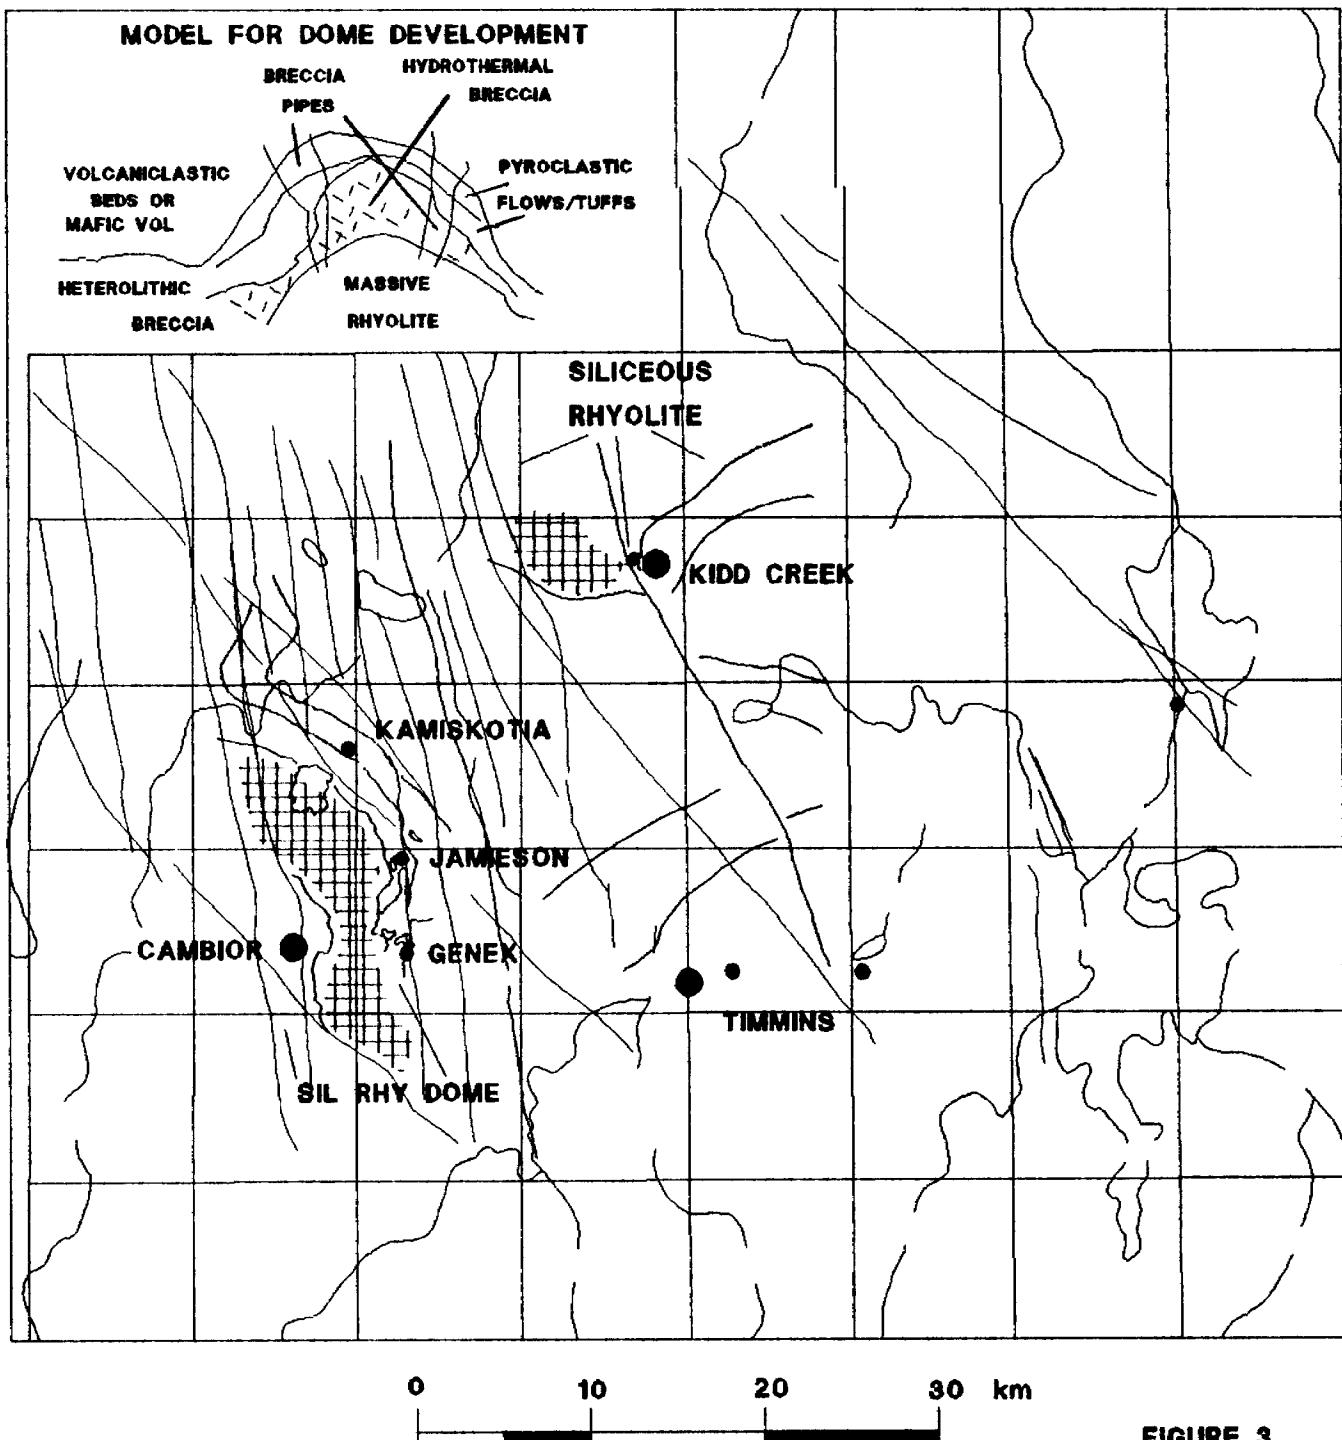

Generally ultramafic and basaltic volcanics underlie the area. These are in turn overlain by massive and pyroclastic rhyolites that again are overlain by basalts and volcaniclastic sediments.

The volcanics are the products of rift related volcanism (bimodal mafic, ultramafic and rhyolitic volcanics) and caldera volcanism (extensive pyroclastic-ignimbrite sequences).

Structurally the area is extremely complex. Major North-South structures in places offset the stratigraphy by up to several kilometres. Compilation of magnetic and EM data suggests complex folding along generally East-West fold axes.

Massive sulphide deposits in the area occur associated with siliceous rhyolite domes and pyroclastic breccias. The distribution of known siliceous felsic volcanics is illustrated in Fig.3 (based on WR lithogeochemistry). The writer believes positioning of the felsics to be controlled by an Archean rifting and submarine caldera or failed caldera development. Intersections of rifting and crosscutting faults controlled the emplacement of rhyolite domes and subsequent massive sulphide deposition.

Mineralization was accompanied by intense hydrothermal alteration resulting in silica (80-90%), potash (5-13%) enrichment and local chlorite alteration (chlorite pipes).

**FIGURE 3**

PROPERTY GEOLOGY

The property is underlain by predominantly caldera related felsic volcanics comprising massive lava flows, fragmental pyroclastic flows and tuffs and less common agglomeritic breccias. Massive mafic to intermediate (diorite and quartz diorite) intrude the felsic volcanics and late gabbro and/or diabase dykes cross cut the property in Northwest-Southeast and North-South directions.

Felsic volcanic sequences appear to be repetitive but this may be structurally related.

Stratigraphy generally trends at approximately 120 degrees and dips steeply south. Massive rhyolites and coarse breccias represent proximal source areas. These appear most common in the southern part of the property.

Felsic Lavas

These rocks are generally massive fine grained grey to white felsic rocks, locally flow banded. Locally they are autobrecciated. Quartz phenocrysts or quartz and feldspar phenocrysts are common.

Rocks are mostly of rhyolitic composition.

Massive lava flows are distinguished from pyroclastic flows by the general lack of lithic fragments though recognition of distinguishing textures is difficult to determine on the weathered outcrop surface, unless the matrix is more altered than the fragments.

Pyroclastic Flows/Tuffs

Pyroclastic flows vary from fine grained quartz feldspar rocks with occasional lithic inclusions to pyroclastic breccias with abundant lithic fragments from 1 cm to 10 cm in size. Tuffaceous interbeds are common. Lithic fragments may be of variable composition and are generally angular to rounded and elongate parallel to the regional foliation.

Locally coarse breccias with angular blocks up to one metre in size suggest proximity to volcanic vents.

Intermediate Intrusions

Depending on the degree of chlorite alteration these rocks vary from dark green to greenish white. Rocks are generally medium grained. Locally carbonate (calcite-ankerite) alteration is common. Quartz eyes attest to the more intermediate composition of the rocks. Composition range from diorite to quartz diorite.

Diabase

Two ages of diabase are present crossing the property an earlier Northwest-Southeast trending phase and a late North-South trending phase. Regional magnetic trends reflect the dyke locations. Dykes tend to reflect the predominant structural trends.

Alteration

Visible alteration comprises chlorite, carbonate, sericite and local areas of silicification. Felsic lava and pyroclastic flows are variably altered. Sericite alteration is locally pervasive giving the rocks a greenish yellow tinge.

Chlorite-ankerite alteration is also locally pervasive especially in the matrix of some fragmental flows and within the intermediate intrusives. The fragmental nature of pyroclastic felsic rocks is more easily recognized as less altered siliceous fragments stand out in the altered matrix.

Intense chlorite alteration also occurs in the vicinity of a Cu, Zn massive sulphide stringer zone intersected in the north central part of the property by earlier Granges and Chevron drilling.

STRUCTURAL GEOLOGY

Stratigraphy generally trends Northwest-Southeast (120-130 degrees) and dips steeply South (70-80 degrees). A subparallel regional foliation (95-120 degrees) reflects the predominant structural (fold axis) trend.

Crosscutting structures trend parallel to regional dyke directions. Both structures and dyke directions are reflected by the magnetics.

LITHOGEOCHEMISTRY

At this time results of the Cambior lithogeochemical sampling have not been received. Some revision of hydrothermal alteration and rock classification can be expected from this data.

Geochemical analyses from the central part of the property are available from the Chevron work. This data indicates a siliceous volcanic dome in the central part of the property area with local potash enrichment. Local potash enrichment also occurs in the Northwest central part of the property.

Further comment on this subject is reserved until all the data can be analysed.

GEOPHYSICS

1:10,000 scale geology and magnetic maps illustrate compilation of available geophysical data. Airborne and ground EM predominantly trends North-South at margins of diabase dykes. This may reflect remobilization of sulphides within the stratigraphy by dyke intrusion.

ECONOMIC GEOLOGY

To date no economic mineralization has been found on the property. However, anomalous gold and base metal values and rock types that typically host volcanogenic sulphides indicate the potential of the property.

Known gold values occur in the intermediate intrusives and are related to narrow quartz veinlets, local shearing and carbonate alteration. Potential major structures have never been tested.

Volcanic base metal mineralization has been detected in previous drilling by Conwest, Chevron and Granges. The most obvious massive sulphide potential occurs in the northern part of the property trending along strike (120 degrees) from a mineralized (Cu-Zn) silicified tuff-breccia horizon and chloritic massive sulphide stringer zone. Silicified tuffs and breccias with anomalous base metal values overly a massive quartz-feldspar porphyry; a typical volcanogenic sulphide environment. Previous drilling on the property has been generally East-West testing conductors that trend parallel to

North-South dykes. Potential stratiform targets have therefore been inadequately tested.

EXPLORATION MODEL

Volcanogenic sulphides can be expected to have formed from hydrothermal activity accompanying the emplacement of massive rhyolite domes. Hydrothermal alteration is reflected in intense silica and potash enrichment. Felsic rocks show compositions up to 90% SiO₂ and 13% K₂O. Local chloritic alteration is also characteristic.

Dome development would be expected to occur at intersecting structures, particularly with early rift zones.

Known siliceous rhyolite horizons and a general expected volcanic model are illustrated in Fig. 3 . These trends probably outline zones of rifting and subsequent submarine caldera formation and will likely control any economic massive sulphide deposits.

RECOMMENDATIONS

The most immediate target is the potential massive sulphide that extends across the north central part of the property. The area previously tested is dissected by several diabase dykes represented by a magnetic high and also intersected by drilling. Core from only one of the previous drill holes has been located in the Timmins Core Library. An attempt should be made to try and locate 1988 Granges drill core as this could enhance the geological picture in the area prior to additional drilling.

At least 2000 metres of drilling is recommended to test the volcanic stratigraphy for geology and massive sulphide mineralization. Pulse EM should be considered to test drill holes for proximity to massive sulphides.

Overburden drilling may be considered to get a better handle on the geology and locate possible mineral trains in the glacial till. Overburden drilling may better locate areas for diamond drilling.

Sufficient linecutting should be considered to locate drill holes and to map outcrop in the Northeast part of the property.

An initial program costing \$375,000 is outlined below.

ESTIMATED BUDGET

Linecutting 50 km @ \$400.00/km	\$ 8,000.00
Overburden Drilling 50 holes @ \$3,000.00 average 30 m depth	\$50,000.00
Diamond Drilling 2000 metres @ \$70.00/m	\$140,000.00
Geologist 2 months @ \$6,000.00/month	\$ 12,000.00
Supervision 2 months @ \$4,000.00/month	\$ 8,000.00
Lithogeochem Assays 200 samples @ \$30.00/each WR, Au, Cu, Zn	\$ 6,000.00
Downhole Geophysics	\$ 10,000.00
Drafting and Report	\$ 5,000.00
Miscellaneous supplies	\$ 2,000.00
	<hr/>
	\$341,000.00
Administration- Contingency 10%	\$ 34,000.00
	<hr/>
	\$375,000.00

CERTIFICATE OF QUALIFICATION

I, Richard M. Sproule, of the city of Timmins, in the Province of Ontario, do declare that:

1. I am a consulting geologist presently associated with M.V.White & Associates Ltd.
2. I am a graduate of Dalhousie University having received a B.Sc. in 1979.
3. I have been working as a geologist full and part time since 1975 and am a fellow of the Geological Association of Canada
4. I was present and assisted in the mapping of property discussed in this report.
5. I have no interest either directly or indirectly in the property described in this report or the securities of Cambior Inc.

September 10, 1991

Richard M. Sproule

M.V.W. WHITE & ASSOCIATES LTD.**CERTIFICATE**

I certify that:

- (a) My name is Michael V.W. White with office address at 637 Algonquin Blvd. E., Timmins, Ontario, P4N 7N2.
- (b) I am a graduate of McMaster University, Hamilton, Ontario with a BSc in geology and chemistry and McGill University, Montreal, Quebec with an MSc in petrology and economic geology. I am a fellow of the Geological Association of Canada. I have been practising my profession continuously for twenty four years.
- (c) I am the writer of this report dated September 10, 1991.
- (d) I have no interest, direct or indirect, in this property or in Cambior Inc., for whom this report is written, nor do I expect to receive any interest at a future date.

A 45915	112	Medium grey/green felsic tuff w/ quartz eyes and tr. carb.
A 45916	113	Grey/green Quartz porphyry fine grained

SAMPLE IDENTIFICATION AND DESCRIPTION

Assay Sample Number	Grab Sample Number	Rock Description
A 45917	114	Quartz feldspar porphyry
A 45918	115	" " "
A 45919	116	" " "
A 45920	117	" " "
A 45921	118	Medium grey green fine grained Quartz feldspar porphyry
A 45922	119	Medium grey tuffaceous felsic fragmental w/ tr. cpy, Py Zn?, and carb
A 45923	120	Medium grey felsic tuff
A 45924	121	Medium grey felsic tuff w/ <1% very fine grained Py.
A 45925	122	Medium grey green Quartz feldspar porphyry w/ tr. Py and carb
A 45926	123	Medium grey green felsic tuff w/ carb & tr. Py.
A 45927	124	Dark-medium green/grey felsic Quartz eye tuff w/carb
A 45928	125	Medium grey green Quartz feldspar porphyry w/ carb (tuffaceous)
A 45929	126	Medium green Quartz eye tuff (felsic) w/ sericite & tr. Py.& carb.
A 45930	127	Medium green Quartz feldspar porphyry tuff
A 45931	128	Pale grey green Quartz eye tuff w/ tr. Py. & hematite on fractures
A 45932	129	Dark-medium green felsic tuff w/ tr. carb
A 45933	130	Medium-pale green felsic Quartz eye tuff w/ carb
A 45934	131	Medium grey/brown felsic Quartz eye tuff (rhyolitic)
A 45935	132	Light grey very fine grained (rhyolitic) tuff w/ quartz eye and carb
A 45936	133	Medium grey green Rhyolitic tuff w/ carb
A 45937	134	Medium grey felsic tuff w/ carb
A 45938	135	Buff-pale grey felsic tuff w/qtz eyes & tr. carb.
A 45939	136	Medium green felsic tuff (rhyolitic) w/ tr. Py.
A 45940	137	Light grey felsic tuff w/ carb
A 45941	138	" " " " " "
A 45942	139	lost sample
A 45943	140	Pale grey green tuffaceous rhyolite w/ tr. carb

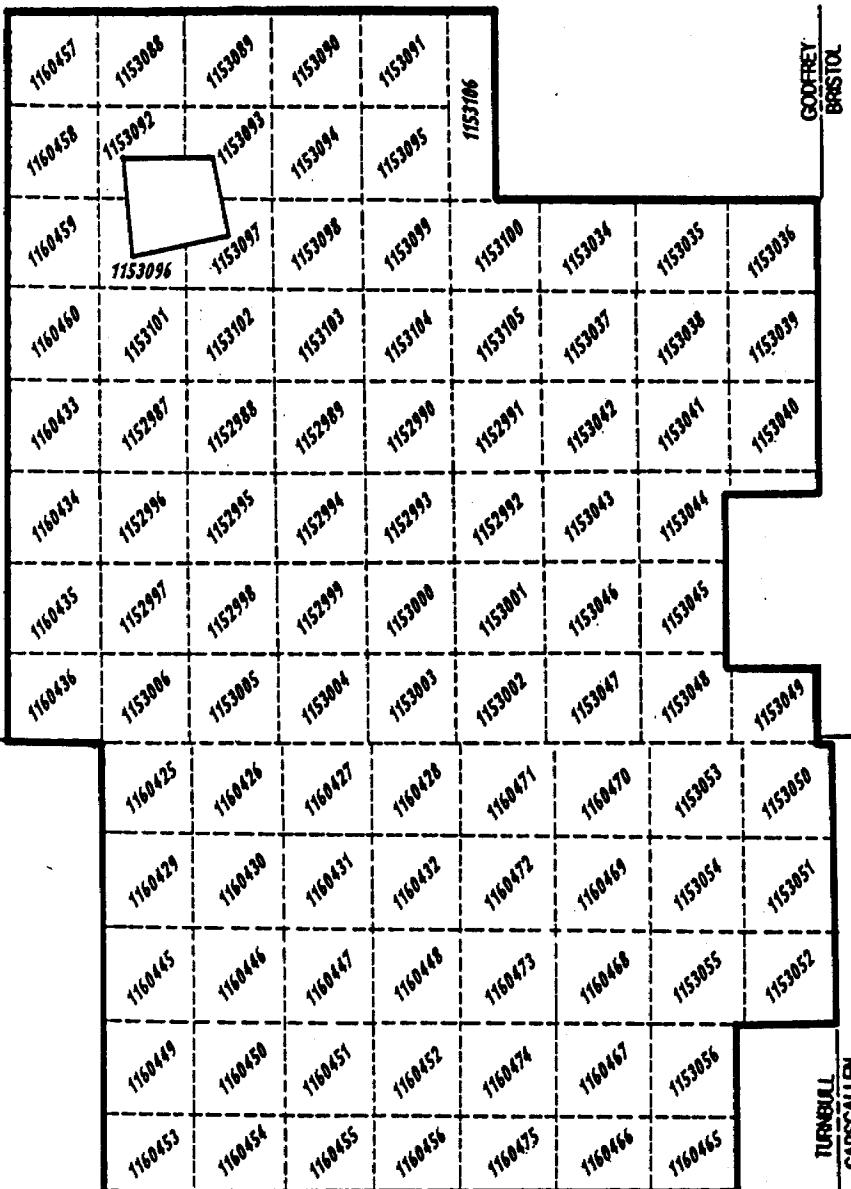

SAMPLE IDENTIFICATION AND DESCRIPTION

Assay Sample Number	Grab Sample Number	Rock Description
A 45944	141	Pale grey green tuffaceous rhyolite w/ tr. carb
A 45945	142	Grey green massive rhyolite
A 45946	143	Buff-pale green felsic tuff with minor carb and tr. sericite
A 45947	144	lost sample
A 45948	145	Pale grey green tuffaceous rhyolite w/carb

Loi sur les mines

Les renseignements personnels contenus dans la présente formule sont recueillis à toute question sur la collecte de ces renseignements au chef provincial des terrains 4^e étage, Sudbury (Ontario) P3E 6A5; téléphone : (705) 670-7284.

42A05NE0100 2.14402 TURNBULL

900

Directives : - Dactylographier ou écrire en lettres moulées.

- Se reporter à la Loi sur les mines et aux règlements d'évaluation ou consulter le registrateur de claims.
- Remplir une formule pour chaque groupe de travaux.
- Joindre à la présente formule deux exemplaires des rapports techniques et des cartes.
- Joindre à la présente formule une esquisse indiquant les claims ayant fait l'objet des travaux.

Statement of Costs for Assessment Credit

État des coûts aux fins du crédit d'évaluation

Mining Act/Loi sur les mines

Transaction No./N° de transaction

W9160.00246

Personal information collected on this form is obtained under the authority of the Mining Act. This information will be used to maintain a record and ongoing status of the mining claim(s). Questions about this collection should be directed to the Provincial Manager, Minings Lands, Ministry of Northern Development and Mines, 4th Floor, 159 Cedar Street, Sudbury, Ontario P3E 6A5, telephone (705) 670-7264.

Les renseignements personnels contenus dans la présente formule sont recueillis en vertu de la Loi sur les mines et serviront à tenir à jour un registre des concessions minières. Adresser toute question sur la collecte de ces renseignements au chef provincial des terrains miniers, ministère du Développement du Nord et des Mines, 159, rue Cedar, 4^e étage, Sudbury (Ontario) P3E 6A5, téléphone (705) 670-7264.

MAIL OCT 28 1991			
3:20 pm			

Note: The recorded holder will be required to verify expenditures claimed in this statement of costs within 30 days of a request for verification. If verification is not made, the Minister may reject for assessment work all or part of the assessment work submitted.

2. Indirect Costs/Coûts indirects

** Note: When claiming Rehabilitation work Indirect costs are not allowable as assessment work.
Pour le remboursement des travaux de réhabilitation, les coûts indirects ne sont pas admissibles en tant que travaux d'évaluation.

Type	Description	Amount Montant	Totals Total global
Transportation Transport	Type Hélicoptère 2 voyages/ Cambior inc. Supervision/ administration	625,00 355,00 1300,00	
			2280,00
Food and Lodging Nourriture et hébergement		483,36	483,36
Mobilization and Demobilization Mobilisation et démobilisation			
Sub Total of Indirect Costs Total partie des coûts indirects		2763,36	
Amount Allowable (not greater than 20% of Direct Costs) Montant admissible (n'excédant pas 20 % des coûts directs)		7527,33	
Total Value of Assessment Credit (Total of Direct and Allowable Indirect costs)		Valeur totale du crédit d'évaluation (Total des coûts directs et indirects admissibles)	40400,00

Note : Le titulaire enregistré sera tenu de vérifier les dépenses demandées dans le présent état des coûts dans les 30 jours suivant une demande à cet effet. Si la vérification n'est pas effectuée, le titulaire peut rejeter tout ou une partie des travaux d'évaluation présentés.

Filing Discounts

- Work filed within two years of completion is claimed at 100% of the above Total Value of Assessment Credit.
- Work filed three, four or five years after completion is claimed at 50% of the above Total Value of Assessment Credit. See calculations below:

Total Value of Assessment Credit	Total Assessment Claimed
x 0.50 =	

Certification Verifying Statement of Costs

I hereby certify:
that the amounts shown are as accurate as possible and these costs were incurred while conducting assessment work on the lands shown on the accompanying Report of Work form.

that as _____ I am authorized
(Recorded Holder, Agent, Position in Company)

to make this certification

Remises pour dépôt

OCT 28 1991

- Les travaux déposés dans les deux ans suivant leur achèvement sont remboursés à 100 % de la valeur totale susmentionnée du crédit d'évaluation.
- Les travaux déposés trois, quatre ou cinq ans après leur achèvement sont remboursés à 50 % de la valeur totale du crédit d'évaluation susmentionné. Voir les calculs ci-dessous.

Valeur totale du crédit d'évaluation	Evaluation totale demandée
x 0,50 =	

Attestation de l'état des coûts

J'atteste par la présente :
que les montants indiqués sont le plus exact possible et que ces dépenses ont été engagées pour effectuer les travaux d'évaluation sur les terrains indiqués dans la formule de rapport de travail ci-joint.

Et qu'à titre de _____ technicien senior _____ je suis autorisé
(titulaire enregistré, représentant, poste occupé dans la compagnie)

à faire cette attestation.

Dear Sir:

**SUBJECT: APPROVAL OF ASSESSMENT WORK SUBMITTED ON MINING CLAIMS
P 1152987 ET AL TURNBULL & CARSCALLEN TWP.**

The deficiencies within your report of work (W9160-00246) have been rectified.

The Assessment Work Credits for the Geological Survey, section 12 and Assays section 17, Mining Act Regulations, submitted on the above work report have been approved as of March 9, 1992.

The enclosed assessment credit form supersedes the one filed as part of the Notice of Deficiency dated January 23, 1992.

Please indicate this approval on your records.

Yours sincerely,

A handwritten signature in black ink, appearing to read "Ron C. Gashinski".
