MINING LANDS BRANCH

INTRODUCTION

During 1992, Mr. Marc Guiho carried out an exploration program on three (3) unpatented mining claims in Godfrey Township. The program consisted of a VLF-EM Survey covering the entire 3 claims on E-W grid lines at 100m line spacing and detailed prospecting on the same. Also, a "packsack" diamond drill hole was drilled to a depth of 115 ft. to test a quartz vein on claim No. 1132989.

The purpose of the program was to prospect the three claims to look for mineralization and or quartz veins such as the one recently discovered by Mr. C. Harrington. the VLF-EM survey was designed to locate any N-S mineralized zones which would most likely be in the form of disseminated sulphides as there is no Airborne EM anomalies on the claims. The drilling done consisted of extending a 13 ft. hold drilled by Mr. C. Harrington in 1991. (see Assessment report T-3453 by K. Filo, June 1991) The hole was extended to a depth of 115 ft.

LOCATION AND ACCESS

The Godfrey Township Property consists of three (3) contiguous unpatented mining claims in Godfrey Twp., Porcupine Mining Division, Ontario. More specifically, the property lies in the north central part of Godfrey Twp. approximately 18km north-west from the city of Timmins, Ontario.

Access to the property is via Hwy 101 west of Timmins, to Hwy 576 (Kamiscotia Lake Road) and north from here for approximately 12km to the turn off to the Kamiscotia Ski Resort. At this point you drive 0.5km to the resort which borders on the NW corner of the property. (see fig 5)

CLAIM STATUS

The Godfrey Township Property consists of three (3) contiguous, unpatented mining claims numbered 1155087, 1132988 and 1132989, located in the north half of Lot 7, Con. VI, Godfrey Twp. Porcupine Mining Division, Ontario. (see fig 6)

PREVIOUS WORK

A number of companies have held the subject property in the past with all recorded work having been done for base metal exploration. No drilling has been done for gold exploration including no drilling on the "Harrington Showing" in the NE corner of claim #1132989. The exception is a hole drilled by C. Harrington which is part of this report.

PROPERTY GEOLOGY

No detailed property geology is available to the author. However, O.G.S. Map No 2205 - Timmins-Kirkland Lake Geological Compilation Series, shows the area to be underlain by felsic metavolcanics. This seems to be substantiated by geological notes obtained by C. Harrington after property visits by Falconbridge Ltd., Rio Algom Ltd. and MNDM geologists.

SURVEY GRID

A total of 6.4km of grid lines were established consisting of a N-S baseline along the east boundary with lines running west at 100m intervals and pickets every 20m.

SURVEY PARAMETERS

Prospecting

The entire grid was prospected by Mr. Marc Guiho, mapping any outcrops encountered, topography etc. with six (6) bedrock samples taken, numbered (GMG-92-1) - (GMG-92-6) inclusive. (See Map No. 8) The sample locations are marked on Map No. 8. Assays for the six samples are included in this report as Appendix C .

VLF-EM Survey

A brief description of the VLF-EM Method and Theory is found in Appendix A in the back of this report. The specific parameters employed for the VLF survey follows:

Instrument - Geonics EM-16

Transmitting Station - Annapolis Md., USA

Frequency - 21.4 Khz

Parameter Measured - In-phase dip angle in percent
- Quadrature Phase in percent

Direction to Tx Station - approx. 150 degrees Azimuth

Data Presentation - Plan profiled map No 7, in phase
and quadrature
- scale 1:2500
- profile scale 1cm = 10%

All readings taken facing N60 degrees E

Diamond Drilling

A "pack sack diamond drill" hole was drilled to a length of 115 ft. using "E" size rods. The hole had been started previously by Mr. C. Harrington and abandoned at 13 ft.. During the current program the hole was extended to the final depth of 115 ft. The hole was collared approximately 100m south and 10m west of post #1, claim #1132989.(fig.7) The hole was drilled at an azimuth of 065 degrees and on an angle of -85 degrees. The purpose of the hole was to intersect a quartz vein discovered by Mr. C. Harrington. The core was split by Marc Guiho and six (6) samples were sent for gold assay. The assay results and intervals are found in Appendix D of this report.

SURVEY RESULTS

The current program on the Godfrey Township Property was successful in outlining several VLF-EM conductors and some bedrock samples indicating favourable geology. The results of the different surveys are discussed as follows:

DIAMOND DRILLING:

Hole No. HP-91-1 was successfully completed to a depth of 115 ft. The entire hole appears to be in felsic volcanics, "Rhyodacite Tuff" (from K. Filo log Appendix E). No significant mineralization was encountered. Of the six samples sent for assay, none were higher than 20 PPB Gold. A narrow, barren quartz vein was intersected from 38.5 ft. - 39.5 ft. Generally, the volcanics are felsic and appear altered. While nothing was encountered to suggest that there is a auriferous zone close by, the geology is certainly favourable for Volcanogenic Massive Sulphide type mineralization.

PROSPECTING:

There is a considerable amount of outcrop exposure on the property, approximately 30 percent. The prospecting showed the property to have basically 'only one "rock type", felsic metavolcanics. Six samples were sent for assay of gold, copper and zinc. The results are included in appendix C in this report. The best gold assay was from sample No. GMG-92-5 which assayed 365 PPB gold. This sample was taken approximately 400m SE of the

trench/drill/quartz vein area and as such time should be spent stripping in this area.

Samples GMG-92-1,2,3,4 all assayed moderately anomalous in zinc. However, copper assays are not as encouraging and the source (mobilization) of the zinc may be some distance away.

VLF-EM SURVEY:

The VLF-EM Survey outlined numerous N-S trending conductive zones. The strongest conductor is situated from L8S/10W - L0/160W, open to the north and south. This conductor appears to be coincident with the western limit of a cedar/balsam swamp shown on Prospecting Map No. 8. There could be some current channelling, however the In-phase readings are extremely high (off scale in some cases). Coupling with Annapolis Md. is not the best but it is within limits.

Without further collaboration from other geophysical survey such as Magnetometer and Horizontal Loop EM, it is difficult to prioritize any of the numerous conductors outlined. There is no obvious correlation with the "quartz vein area " in the NE corner of claim 1132989 and any anomalous VLF-EM response.

CONCLUSION AND RECOMMENDATIONS

The OPAP work on the Godfrey Township Property was successful in outlining several VLF-EM conductors. While the drill results were not positive, the drill core plus samples taken from various outcrops on the property indicate favourable geology for massive sulphide base metal deposition. To this end it is recommended that another look at the property be taken with an emphasis on base metal exploration. This should consist of a large cable (200m) max-min survey to cover the entire property. This would detect any mineralization within and approaching the depth capabilities of the Airborne EM survey conducted by the government. In light of recent activity at the "Jamieson Mine" and "Kam-Kotia Mine" by Falconbridge Ltd. it would be worthwhile doing a Deep Penetrating Electromagnetic Survey such as Large Loop Time Domain EM.

APPENDIX A

VLF - EM Survey

While VLF stands for Very Low Frequency, it is for mineral exploration purposes a very high frequency compared to other commonly used Electromagnetic Surveys. The commonly used frequencies are in the order of 18-20 kilohertz. The VLF-EM technique employs fixed transmitter stations located at various places around the world to facilitate navigation. Because of this, one has a limited choice as to what transmitter station that can be used, depending on distance from and azimuth to the transmitter station.

Very briefly, the transmitting station emits a concentric, circular wave pattern, expanding about the transmitter dipole. Being thousands of miles away from the transmitter, we deal with the tangent of this wave pattern which in this case would have a direction normal to the azimuth to the station. Thus any conductors having a general strike parallel to this azimuth would be intersected by this signal which induces a signal in the conductor which in turn opposes the primary signal from the transmitter station. This elliptically polarizes the resultant field enabling detection of the conductor using a receiver coil to determine the attitude of the resultant field at various points along the grid lines.

The resultant field dips away from the conductor axis on both sides of the conductor producing a cross-over on the conductor axis. For an EW conductor, a true cross-over would occur where the field dips south and changes to a north dip as you progress from south to north. For this survey, a +/- system is used where a (+) dip angle means the field is dipping to the south (indicating anomaly is to north) and a (-) dip angle means the field is dipping to the north (indicating anomaly is to south). This is the case only if all readings were taken facing north as per this survey.

The quadrature values, while not useful alone, can help distinguish between bedrock conductors which generally have a smaller out-of-phase response than overburden or short wavelength conductors. Also, the polarity of the quadrature is diagnostic, ie; if the polarity follows or is the same sense as the In-phase it gives more credibility to the conductor. Reverse quadrature often indicate overburden responses.

APPENDIX B

VLF EM

EM16

One of the most popular and widely used electromagnetic instruments, the EM16 VLF receiver makes the ideal reconnaissance EM. This can be attributed to its field reliability, operational simplicity, compactness and mutual compatibility with other reconnaissance instruments such as portable magnetometers and radiometric detectors.

The VLF method of EM surveying, pioneered by Geonics, has proven to be a simple economical means of mapping geological structure and fault tracing. The applications are many and varied, ranging from direct detection of massive sulphide conductors to the indirect detection of precious metals and radioactive deposits.

FEATURES

- The EM16 is the only VLF instrument that measures the quad phase as well as the in-phase secondary field. This has the advantage of providing an additional piece of data for a more comprehensive interpretation and also allows a more accurate determination of the tilt angle.
- The secondary fields are measured as a ratio to the primary field making the measurement independent of absolute field strength.
- The EM16 is the only VLF receiver that can be adapted to measure VLF resistivity.

Specifications

MEASURED QUANTITY	In phase and quad phase components of vertical magnetic field as a percentage of horizontal primary field. (i.e. tangent of the tilt angle and ellipticity)
SENSITIVITY	In phase : $\pm 150\%$ Quad phase : $\pm 40\%$
RESOLUTION	$\pm 1\%$
OUTPUT	Nulling by audio tone. In phase indication from mechanical inclinometer and quad-phase from a graduated dial.
OPERATING FREQUENCY	15-25 kHz VLF Radio Band. Station selection done by means of plug-in units.
OPERATOR CONTROLS	On/Off switch, battery test push button, station selector switch, audio volume control, quadrature dial, inclinometer.
POWER SUPPLY	6 disposable 'AA' cells
DIMENSIONS	42 x 14 x 9 cm
WEIGHT	Instrument : 1.6 kg Shipping : 5.5 kg

VLF RESISTIVITY METER

EM16/16R

The EM16R is a simple, button on attachment to the EM16 converting it to a direct reading terrain resistivity meter. The EM16R interfaces a pair of potential electrodes to the EM16 enabling the measurement of the ratio of, and the phase angle between, the horizontal electric and magnetic fields of the plane wave propagated by distant VLF radio transmitters.

The EM16R is direct reading in ohm-meters of apparent ground resistivity. If the phase angle is 45° , the resistivity reading is the true value and the earth is uniform to the depth of exploration (i.e. a skin depth). Any departure from 45° of phase indicates a layered earth. Two layer interpretation curves are supplied with each instrument to permit an interpretation based on a two layer earth model.

This highly portable resistivity meter makes an ideal tool for quick geological mapping and has been used successfully for a variety of applications.

- Detection of massive and disseminated sulphide deposits
- Overburden conductivity and thickness measurements
- Permafrost mapping
- Detection and delineation of industrial mineral deposits
- Aquifer mapping

Specifications EM16R ATTACHMENT

MEASURED QUANTITY	• Apparent Resistivity of the ground in ohm-meters • Phase angle between E_x and H_y in degrees
RESISTIVITY RANGES	• 10 — 300 ohm-meters • 100 — 3000 ohm-meters • 1000 — 30000 ohm-meters
PHASE RANGE	0-90 degrees
RESOLUTION	• Resistivity : $\pm 2\%$ full scale • Phase : $\pm 0.5^\circ$
OUTPUT	Null by audio tone. Resistivity and phase angle read from graduated dials.
OPERATING FREQUENCY	15-25 kHz VLF Radio Band. Station selection by means of rotary switch.
INTERPROBE SPACING	10 meters
PROBE INPUT IMPEDANCE	100 Ω in parallel with 0.5 picofarads
DIMENSIONS	19 x 11.5 x 10 cm. (attached to side of EM16)
WEIGHT	1.5 kg (including probes and cable)

CERTIFICATION

I, Raymond Meikle of Timmins, Ontario hereby certify that:

1. I hold a three year Technologist Diploma from the Haileybury School of Mines, Haileybury, Ontario obtained in 1975.
2. I have been practising by profession since 1973 in Ontario, Quebec, NWT, Manitoba, New Brunswick, Nova Scotia for Teck Exploration Ltd., Metallgesellschaft Canada Ltd., Rayan Exploration., and Sabina Industries Ltd.
3. I was not present for any of the surveys and did not have any input in to the design and implementation of the program.
4. I have based conclusions and recommendations contained in this report on knowledge of the area, my previous experience, and on the results of the field work conducted on the property during 1992 which was carried out by Marc Guiho using an OPAP grant.
5. I hold no interest, directly or indirectly in this property other than professional fees, nor do I expect to receive any interest in the property.

Dated this 14th day of December 1992

Credits you are claiming in this report may be cut back. In order to minimize the adverse effects of such deletions, please indicate from which claims you wish to prioritize the deletion of credits. Please mark (✓) one of the following:

1. Credits are to be cut back starting with the claim listed last, working backwards.
2. Credits are to be cut back equally over all claims contained in this report of work.
3. Credits are to be cut back as prioritized on the attached appendix.

In the event that you have not specified your choice of priority, option one will be implemented.

Note 1: Examples of beneficial interest are unrecorded transfers, option agreements, memorandum of agreements, etc., with respect to the mining claims.

Note 2: If work has been performed on patented or leased land, please complete the following:

I certify that the recorded holder had a beneficial interest in the patented or leased land at the time the work was performed.
