57.9	78.7	Ultramafic	Talc-Chlorite Rock Dark grey to green grey, fine-grained. Cataclastic structures - blocky core, much gouge. Similar to previous sections of ultramafic. 10% quartz-carbonate veining pervading the unit. Soft, talcose. Nonmagnetic.								
78.7	79.2	Mafic Dyke	Fine-grained, massive, distinct brownish cast. Appears carbonatized. Sharp contacts.								
79.2	82.7	Altered Mafic Volcanic	Contact alteration with ultramafic. Medium grey-green, medium-grained (alteration effects) - appearance of ultramafic but probably contact effect as rock in not soft or talcose. Coarse, blotchy texture, variably foliated but strong fabric for 10cm after upper contact. Uniform appearance to 82.7m where contact affect diminishes. Lower contact appears gradational over 10's of cm.								
82.7	110.7	Mafic Volcanics	Weak Alteration - Bleaching Effects (Quartz-Carbonate) Fine-grained, medium grey-green, foliated to massive appearance with fragmentation and fine intraflow breccia structures - local flow breccia. 92.7-93.1: Limonite stained water seam. 96.4-105.9: More pristine mafic section - moderately magnetic. Much darker colour - blackish grey-green, homogeneous appearance. Lower contact gradational - alteration increasing.
