DIEPDAUME MINES LIMITED PROPERTY
Tisdale and Deloro Townships, Ontario

REPORT OF WORK PERFORMED
JANUARY 1 - DECEMBER 31, 1983

1. SUMMARY

A. The Property

The property is comprised of the former Preston East Dome Mines Limited, which produced gold from 1938 to 1968. During this period, the Preston East Dome mined 6,284,405 tons with an average grade of 0.24 oz gold per ton.

Located in Tisdale Township in the Porcupine Mining Division of Ontario, the property adjoins the south boundary of Dome Mines Limited which is in full production.

The mine was left in bad disorder and in an unsafe condition, and requires extensive rehabilitation to meet safe production standards.

This report also includes a group of claims in Deloro Township, adjoining the south boundary of the main mine property.

B. The Programme and Its Objectives

The Preston East Dome workings broke into the workings of the Paymaster Mine in the Midcamp Section of the Preston Mine.

The closing of the Paymaster Mine and its subsequent flooding ultimately forced the closing of the Preston East Dome which did not have the pumping capacity to handle the extra influx of water. Preston was faced with the problem of pumping 850 gallons of water per minute. This included 350 gallons per minute from the Paymaster and 90 gallons per minute from the Buffalo Ankerite Mine.

As a result, considerable tonnage of ore, which would be viable at the current price of gold, was left in place.

In the Midcamp Area of the Preston Mine there remain 350,000 tons of sulphide ore with an average grade of 0.15 oz gold per ton between the 18th level and the 10th level. The bulk of the Preston ore was free-milling and 60 percent of the gold was recovered on the jigs. The remainder was recovered by cyanidation.

However, there was no flotation circuit to handle the sulphide ore which caused the flouting of the mercury and prevented amalgamation. In addition, the chlorite from the sulphide ore clogged the filters and the pyrrhotite consumed large quantities of cyanide.

The present mill being constructed on the Diepdaume Property has a flotation system and can handle the sulphide ore.

Further, a minimum of 50,000 tons of ore with an average grade of approximately 0.5 oz gold per ton was developed on the Preston 14th level near the Dome boundary close to the Diepdaume Main (No. 2) Shaft. This was the highest grade ore ever encountered at the Preston East Dome. The rising water prevented it from being mined. It still remains in place.

In addition, ore from the Dome Mine strikes and dips onto the Diepdaume on its 19th level (Dome, 20th level). This represents a considerable tonnage on the Diepdaume Property, which has been partially developed but was not mined, due to the rising water.

Considerable tonnage was left in the walls of the large stopes in the Preston porphyry between the 9th level and surface. This would now be ore at current gold prices. Both Dome and Pamour (former McIntyre Mine) are now mining large tonnages of similar ore from the walls of their old stopes.

An estimated 100,000 oz of gold remains in the shaft pillar of the No. 2 Shaft, between the 4th and 7th levels.

During 1983, dewatering continued below the 600 level, accompanied by shaft rehabilitation. Four holes were diamond-drilled from the Dome 19th level to investigate the adjoining Diepdaume ground at that elevation.

Surface diamond drilling was conducted in four areas: north and south of Simpson Lake; on the west boundary of the Augdome property; and in an area 400 feet west of the Augdome boundary.

Extensive chip and channel samples were taken on the Deloro Township group, and grid sampling was conducted on a muck pile north of the No. 2 Shaft.

The surface sampling programme is outlined in Appendix 1.

During this period, reconstruction of the mill continued.

2. UNDERGROUND PROGRAMME

A. Rehabilitation

In 1983, the shaft was dewatered to a depth of 746 feet and was rehabilitated below the 6th level.

Below the 600 level, the manway was stripped and new ladders and landings were installed. Shaft timber was replaced and tight lining was renailed or replaced. The shaft safety bulkhead was removed and lowered.

A new dam was constructed in the shaft crosscut on the 600 level (Figure 1) and a 30 h.p. FLYGT pump was installed behind the 600 level dam to supply the 500 level dam.

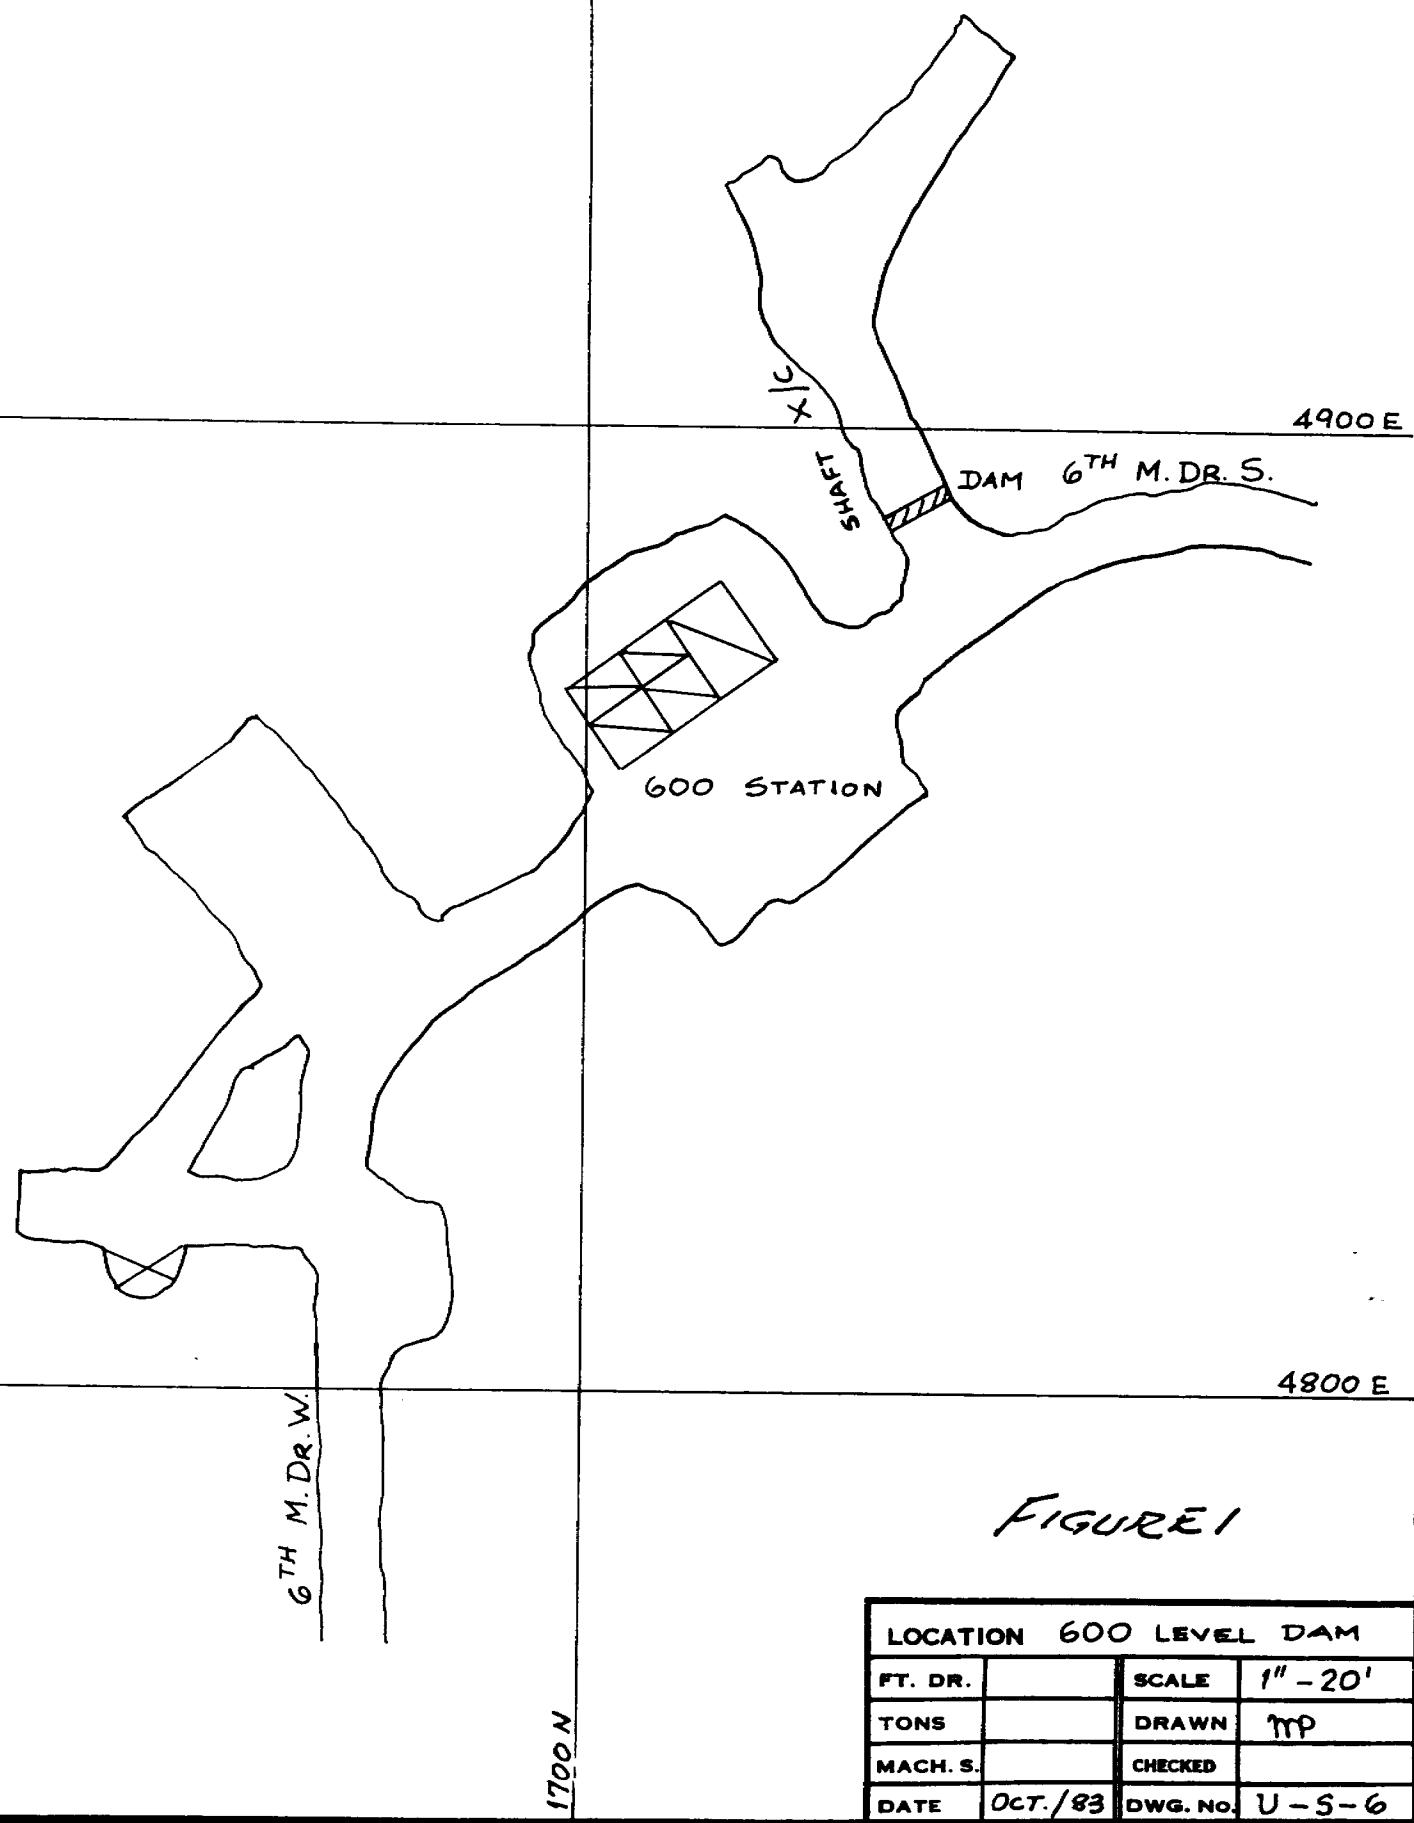

FIGURE 1

LOCATION 600 LEVEL DAM			
FT. DR.		SCALE	1"-20'
TONS		DRAWN	MP
MACH. S.		CHECKED	
DATE	OCT. / 83	DWG. NO.	U - S - 6

The 30 h.p. FLYGT pump that was installed in the shaft was lowered to continue the dewatering programme. The 140 h.p. FLYGT pump, located on the 500 level, was removed and sent for repair.

Rehabilitation and re-timbering continued on the 500 and 600 levels to provide access to the stopes on these levels.

B. Underground Diamond Drilling Programme

Arrangements were made with Dome Mines Limited to diamond drill 4 holes from their 1922 #6 Drift East to test for gold values in the Preston Porphyry on the Diepdaume property at this elevation. Since this is not close to the developed ore on the Diepdaume property at this elevation, these were, essentially, exploratory holes investigating a new area of considerable potential.

Morissette was the contractor on this drilling project which was supervised by the staff of Dome Mines.

The first of these holes, No. 20.946, was completed to a depth of 386 feet in December 1983. Gold values intersected in this hole were low, with the best intersections 0.049 oz gold per ton across 5 feet from 240.4 feet to 245.4 feet, and 0.051 oz gold per ton across 3.5 feet from 282.0 to 285.5 feet. See Figures 2 and 3, Appendix 2.

Appendix 2 contains log, assays, plan and section of drill hole 20.946, along with Dome's check assays of some Diepdaume results. Appendix 2 also includes Figures 4 and 5, which are sections of drill holes 20957, 20962 and 90969, which were drilled in 1984 and, hence, are not detailed in this report of 1983 activities.

3. SURFACE EXPLORATION

As mentioned in the Summary, surface exploration consisted of diamond drilling in 4 areas and sampling programmes in 2 locations. The sampling programmes are detailed in Appendix 1.

The surface drilling programme consisted of 1320 feet in 14 holes.

A. Area on North Side of Simpson Lake

The logs, assays, plan and sections are included in Appendix 3. Figures 6, 6a,b,c,d.

Four holes, DW-1, -2, -3 and -4, a total of 380.6 feet, were bored to check possible extensions of a gold zone intersected in a hole (#9) drilled in 1937,

which averaged 0.130 oz gold per ton across 35.4 feet. No significant gold-bearing structure was intersected by the holes which cut sporadic gold values.

Hole DW-2 intersected 0.336 oz gold per ton across 1.3 feet in a narrow quartz vein.

Hole DW-3 cut 0.03 oz gold per ton across 15.2 feet.

Hole DW-4 cut 0.058 oz gold per ton across 4.0 feet.

B. Area on South Side of Simpson Lake

For logs, assays, plan and sections, see Appendix 3 and Figures 7, 7a, 7b.

A 1937 drill hole (#4) intersected 0.385 oz gold per ton across 5.0 feet.

Four holes, DW-5, -6, -7, -8, failed to intersect comparable values. A total of 385.2 feet was drilled here.

Hole DW-5 cut 0.131 oz gold per ton across 4.4 feet. and 0.039 oz gold per ton across 5.0 feet.

Hole DW-7 cut 0.085 oz gold per ton across 6.2 feet from 6.5 to 12.7 feet.

C. Area on West Side of Augdome Property

Five holes, DW-9, -11, -12, -13, -14, were bored a total of 434.5 feet to check the upward extension of the gold ore zone reported on the adjoining Augdome property. See Appendix 3 for logs, assays, plan, sections - Figures 8, 8a, c, d, e, f.

Low gold values were cut in quartz porphyry, but these holes failed to reach the projection of the Augdome ore zone. A heavier drill is required to test this area adequately.

Hole DW-9 cut 0.11 oz of gold per ton across 20 feet from 30.0 feet to 50.0 feet or 0.17 oz gold per ton across 10.0 feet from 40.0 - 50.0 feet.

Hole DW-12 cut 0.052 oz gold per ton across 8.3 feet from 24.2 to 32.5 feet.

Hole DW-13 cut 0.046 oz gold per ton across 10.0 feet from 20.0 to 30.0 feet.

Hole DW-14 cut 0.05 oz gold per ton across 5 feet from 30.0 to 35.0 feet and 0.06 oz gold per ton across 5.0 feet from 45.0 to 50.0 feet.

Further drilling, employing a heavier drill, is indicated for this area.

D. Area 400 Feet West of Augdome Boundary

One hole, DW-10, 120 feet in length, was drilled in this area to investigate values cut in 1937 drilling. See Figures 8 and 8b. Logs, assays, plan and sections are included in Appendix 3.

Hole DW10 cut 0.143 oz gold per ton across 5.0 feet from 100.0 to 105.0 feet.

Again, further drilling is indicated for this sector.

4. COSTS INCURRED

A total of \$512,779.00 was expended on the property during the period.

A breakdown of the apportioned costs accompanies the Application for the Ontario Mineral Exploration Programme Grant.

H.A. Pearson
H.A. Pearson, P.Eng.

APPENDIX 1

APPENDIX 1

THE SURFACE SAMPLING PROGRAMMES

Surface sampling was conducted in two locations: on the Deloro Township claims, and on a muck pile north of No. 2 shaft.

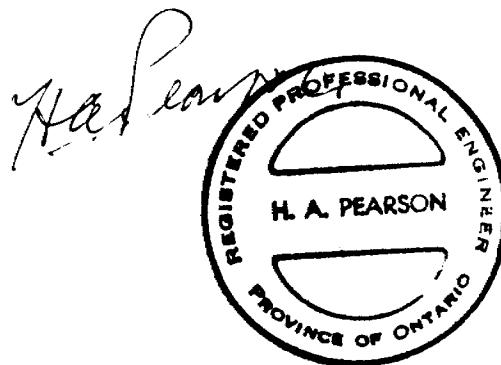

A. Deloro Township Sampling (See Figure 9)

Sampling on the Deloro Township group consisted of 41 channel samples (185 feet), samples D-1 to D-41, and 3 grab samples 4529, 4530, 4531.

These samples were taken on silicified iron formation and a few quartz veins. Gold values were insignificant.

B. Muck Pile North of No. 2 Shaft (See Figure 10)

A grid was established here and 111 representative muck samples were taken at 10-foot intervals, in indicated in Figure 10. Gold values were negligible, with 0.061 oz gold per ton the highest assay.
