GEOPHYSICAL REPORT ON THE FRIPP PROJECT GRID
FRIPP, McARTHUR & PRICE TWPS., DISTRICT OF TIMISKAMING
PORCUPINE MINING DIVISION - NTS 42 - A - 6

1.0 SUMMARY

Northgate Exploration Limited holds, partly by staking and partly by option, a total of 149 claims extending southeast from the south end of Price Township through Fripp Township into McArthur Township. A grid was cut over 110 of these claims with base lines trending northwest and tie lines cut at 400 foot intervals perpendicular thereto. The grid totals 94.58 line miles and was cut between September and November 1981. Subsequently, a magnetometer survey was completed over the whole grid in November 1981. Plotting and interpretation of the magnetometer results was undertaken in April 1982.

The magnetic expression clearly distinguishes linear zones of sediments including iron formations from the extensive intermediate volcanic terrain. A unit with very low magnetic response is believed to be granitic terrain while several broad areas of higher magnetic relief are suspected as representing areas underlain by mafic or ultramafic units. Major dykes or structural breaks trend north-northwest, north and east-northeast.

2.0 LOCATION

The Fripp Option property, consisting of a narrow group of mining claims, stretches from Price Township in the north, southeastwards to McArthur Township. The mid-point of the group lies in the northeastern quadrant of Fripp Township and is 27 kms south-southwest of Timmins and approximately 570 air kms north of Toronto (Figure 1).

3.0 ACCESS

Major forest access routes, extending due south from Timmins (Pine Street) into the general area of the property are excellent and, although gravel, are well maintained and plowed during the winter months.

Within the claim block itself there are numerous connecting dirt and

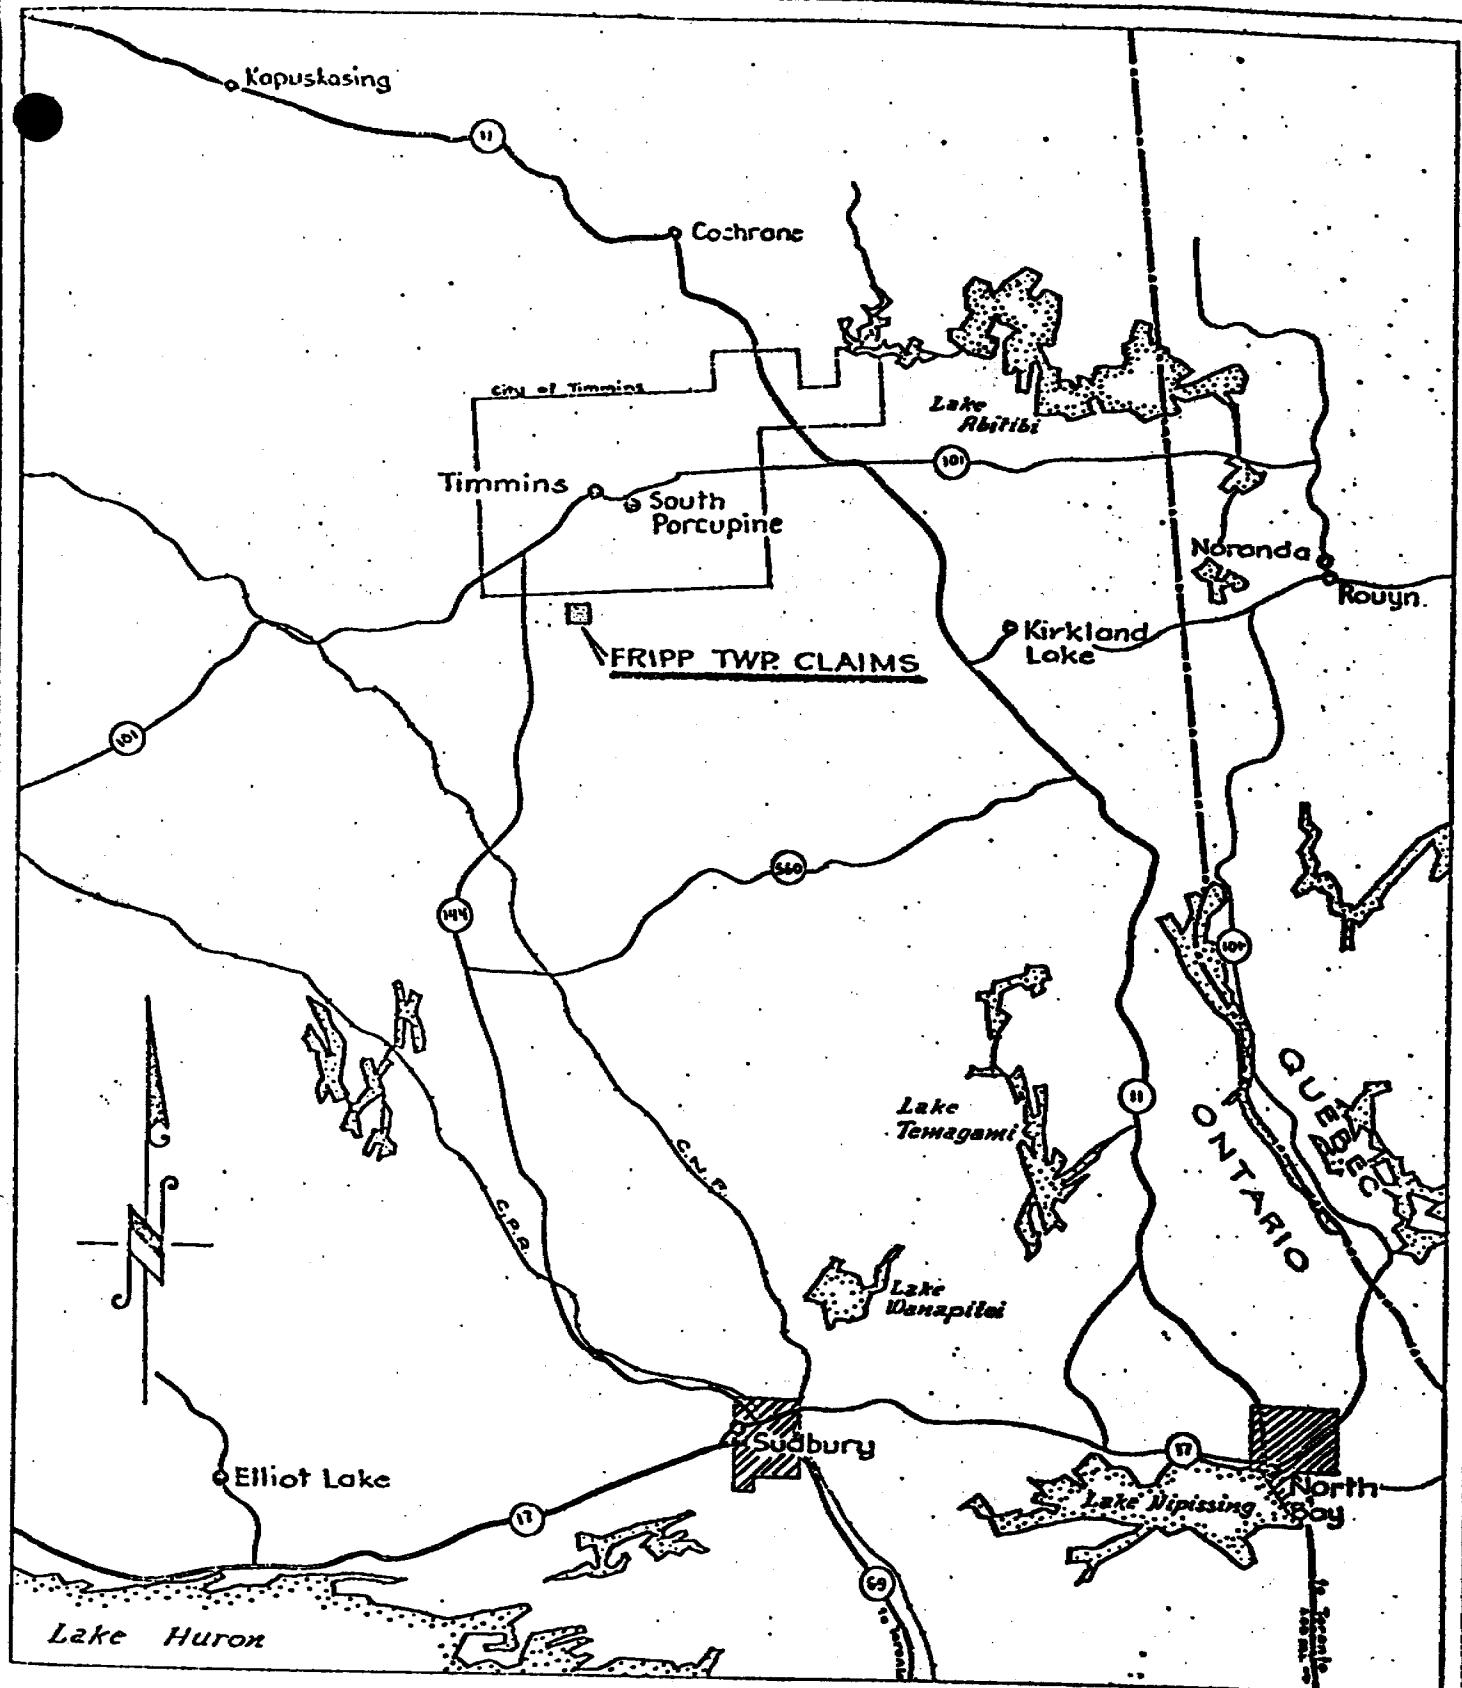

Figure 1
LOCATION MAP
showing
FRIPP TWP. CLAIMS

10 0 10 20 30 40 50
MILES

logging roads, however, they are not maintained and may become impassable during the winter and early spring.

Access to the northernmost claims is poor with the possibility of an old lumber road existing three quarters of a mile to the west. This route has still to be investigated.

The lack of sufficiently large lakes or rivers prohibits the use of fixed wing aircraft as an alternate source of transportation.

Water transport is also prohibitive, since most of the lakes and streams are not suitable for continuous navigation.

4.0 PHYSICAL FEATURES

4.1 TOPOGRAPHY

Price, Fripp and McArthur Townships are characterized by low, rocky hills, unconsolidated glacial deposits and poorly drained swamps. Rarely does the local topography exceed thirty metres in elevation which is typical of the Precambrian Peneplain.

Lakes in the general area are shallow, small and are usually the result of beaver dams. Many are intermittent and tend to evaporate during the summer months.

4.2 TIMBER

Forest cover in this area is relatively good with mature stands of poplar, birch, spruce and pine being common on the higher ground. The lower swampy areas are covered with alder saplings and moose maple.

Large scale harvesting does occur within the area, however, only small cleared areas exist on the property due to selective cutting.

4.3 CLIMATE

The Timmins area has a continental climatic pattern which is characterized by dry, cold winters and hot, humid summers.

Winter, which can begin as early as mid-October and continue until mid-May, experiences temperatures as low as -40°C over extended periods and snow cover to 5 feet in forested areas.

The summer months, on the other hand, have warm to hot temperatures which are sometimes accompanied by uncomfortable humidity.

Both spring and fall months have pleasant sunny days, but cool nights. These seasons, however, can be marred by freezing temperatures, frost and snow.

5.0 PROPERTY AND OWNERSHIP (Tables 1 & 2)

The Fripp Project property, as originally presented, consisted of a block of 74 unpatented mining claims, distributed in Price, Fripp and McArthur Townships. All claims were staked by Dennis Bordin of Timmins in the spring of 1981 and were in good standing.

Northgate Exploration Limited expanded this group in two phases, by staking an additional 75 claims. The first phase protected by the blocks' eastern boundary and to form one contiguous group with Westfield's claims in McArthur Township. The second phase extended part of the boundary southwards in Fripp Township to adjoin and partially surround five leased claims currently held by Hollinger-Argus, and containing a mineral deposit of approximately 165,000 tons averaging 3% copper.

The Fripp Project property now consists of 149 mining claims or about 6,000 acres (Figure 2).

6.0 REGIONAL GEOLOGY (Figure 3)

All of the rocks which underlie this area are of early Precambrian Age (Archaean) and have been capped by a mantle of Pleistocene and Recent unconsolidated deposits.

The Archaean rocks consist of two cycles of volcanism in which each cycle contains a basal ultramafic sequence of flows. Mafic metavolcanics overlie this unit and generally contain massive, as well as, pillow flows. These in turn are overlain by an upper unit of intermediate to felsic metavolcanics consisting of massive flows, but more commonly tuffs, lapilli tuffs, and breccia. It is within

CLAIMS LOCATION MAP

Scale 1 : 63,360

the upper unit that intercalated sedimentary beds occur including siltstones, grey-wackes, and iron formation.

The lower metavolcanic unit has been intruded by both felsic and mafic magmas which have formed small domes of quartz-feldspar porphyry in the felsic volcanics and gabbroic sills in the mafic volcanics, respectively.

A pre-tectonic age has been affixed to the gabbro while the porphyry is syntectonic and may be part of a feeder system for the felsic rocks.

Large emplacements of granitic magma late in the tectonic cycle formed the Adams Batholith and the poly-phase Peterlong Lake complex.

Numerous diabase dykes transect the area and are middle to late Precambrian in age.

The Archaean volcano-sedimentary series has been compressed and warped about the granitic domes in Adam and Giekie Townships. The Bordin-NGX property lies on the western flank of this structure.

Numerous north to northwesterly faults traverse or follow the trend of the disturbed and infolded volcanic inliers.

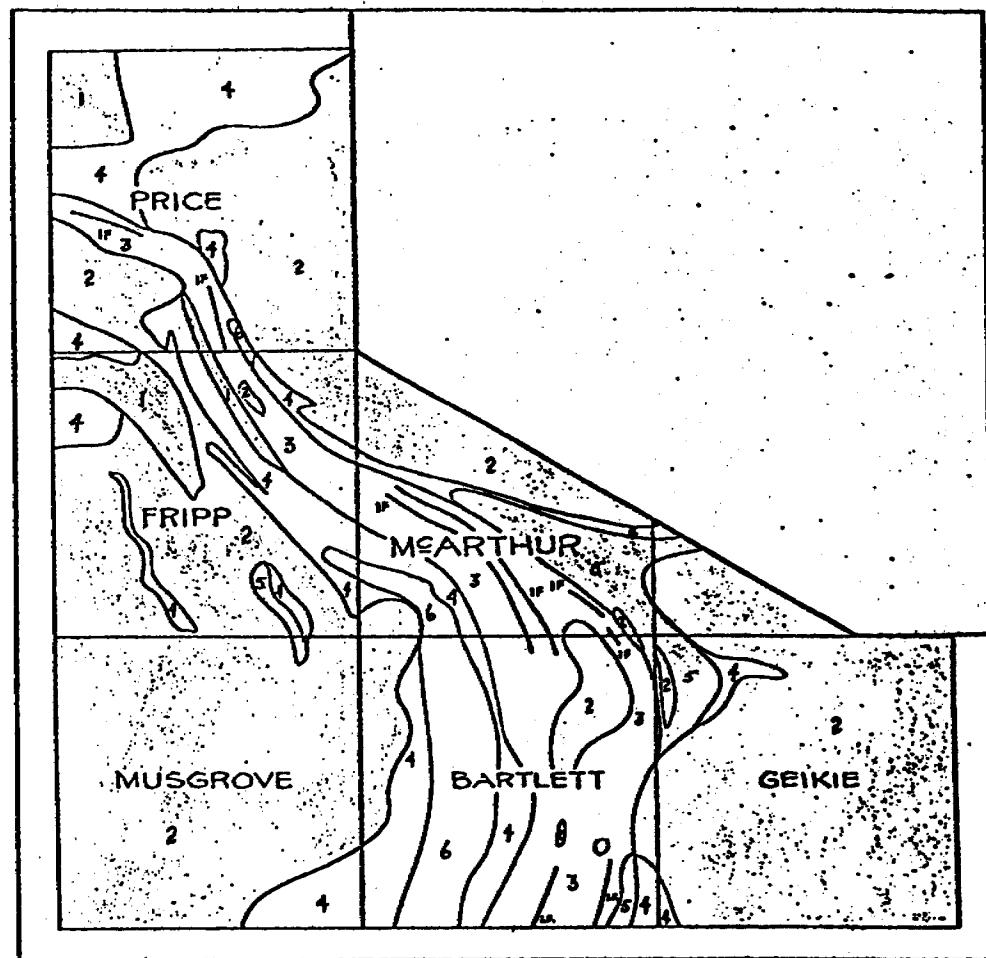

7.0 STRUCTURE

From previous mapping, the volcanic and sedimentary rocks strike in a northwesterly direction and have steep northeasterly dips. Pillow top determinations have confirmed this while northeast of Katoshaskepeko Lake tops indicate southwesterly dips suggesting that a synclinal fold axis trends southeasterly beneath the lake.

Very few faults have been recognized in outcrop and these have had small displacements. Lineaments from the aerial photos suggest major displacements masked in the warping evident in the margins of the granitic masses.

8.0 LINE CUTTING

Henry Gonzalez of Timmins, contracted to cut the required grid and completed

such during the period September 11th to November 20th, 1981. The grid comprises a main northwest trending base line down the centre of the claim block with subsidiary base lines at 27 and 53 South and 27, 47 and 52 North. Tie lines at right angles to the base lines were cut at 400 foot intervals and picketed every 100 feet. Claims have been tied into this grid and are shown with the grid on Figs. 4, 5, and 6, (in back pocket). Details of line cutters and line cutting are in Appendix I.

9.0 MAGNETOMETER SURVEY

9.1 FIELD METHOD AND INSTRUMENTATION

The survey was undertaken by Geophysical Technician, Mr. A. McParland, a recent graduate of Haileybury School of Mines, during the period November 7th to 24th, 1981. A total of 12 man days were required to complete coverage of the grid. Mr. McParland operated from a trailer camp established on the property with support provided from Northgate's Timmins office at 107 Wilson Street, Timmins. (Mr. McParland's address is also c/o Northgate Exploration Limited, 107 Wilson Street, Timmins, Ontario P4N 2S8.)

Readings were taken at the 100 foot picketed intervals on all lines with a Scintrex Proton Magnetometer, model MP 2 (for details, see Appendix II). A Scintrex MBS-2 Field Magnetic Base Station, which is compatible with the MP 2, was installed at the trailer camp to provide records for diurnal corrections.

Data plotting, contouring and interpretation were subsequently undertaken in Northgate's Toronto office in April 1982. The results are presented on Figs. 4, 5, and 6 (in the back pocket), which detail lines, claims and corrected magnetic readings Figs. 7, 8, and 9 show contoured results and interpretation is superimposed on Figs. 10, 11, and 12.

The line cutting and magnetometer field survey were supervised by Northgate's Project Geologist, Mr. P. A. Dadson, who was present on the property most of the period and was engaged in an initial geologic reconnaissance and detailed examination of several pre-existing showings of massive sulphide style mineralisation.

Massive sulphide deposits are the primary objective of the exploration

program and the line cutting and magnetometer survey are the first regional surveys of the claims.

The overall project and, in particular, the interpretation of the magnetic survey results was supervised by Dr. Gerald Harper, Chief Geologist of Northgate Exploration Limited.

9.2 DISCUSSION AND INTERPRETATION OF RESULTS

Fripp Township has not been mapped yet at township scale by the Ontario Geological Survey, but it is known, from prior prospecting, reconnaissance and extrapolation from adjacent townships, to be underlain by a relatively narrow belt of north to northwest trending Archaean metavolcanics and metasediments flanked to the east and west by granite - gneiss terrain. O.G.S. Map 2455, the Precambrian Geology of the Timmins Area; Scale 1:50,000, suggests the predominant rock type to be expected besides granite to be intermediate volcanic flows and tuffs, felsic volcanics and chemical sediments including iron formations. Along the east flank of the volcanic belt, mafic to ultramafic volcanics and intrusives are to be anticipated as they outcrop intermittently in neighbouring townships adjacent to the edge of the Adams Pluton, the granitic batholith forming the eastern boundary of the Fripp Township volcanic belt. Later dykes traverse the area primarily along north and east-northeast trends.

Eight more or less distinct magnetic units can be interpreted:

<u>Unit</u>	<u>Magnetic Range</u>	<u>Magnetic Character</u>
1a	+3,000 - +20,000&	Narrow linear zones striking from north-northwest in the north to northwest in the south.
1b	+1,500 - +3,000&	Narrow linear zones paralleling and forming extensions to 1a.
2a	+500 - +3,000&	Broad linear zones characterised by considerable internal local magnetic relief. Striking north-northwest, they only occur in the northern part of Fripp Township and in Price Township.

<u>Unit</u>	<u>Magnetic Range</u>	<u>Magnetic Character</u>
2b	+500 - +2,000γ	Broad linear zones characterised by very minor internal local magnetic relief. They only occur southeast of 2a and are mainly along the east side of the area as oval pods generally elongated northwesterly.
3	+200 - +1,000γ	Broad areas of moderate internal magnetic relief. Such trends as can be distinguished tend to follow those of 1a.
4	-200 - +200γ	Irregular shaped areas of the lowest magnetic relief recorded which are distributed throughout the area, but concentrated on the east and west sides and in the centre of the belt between lines 40 and 80 W. Predominant orientations of these zones are northwest and north-northwest with a few trending north.
5	+500 - +1,500γ	Narrow linear zones of relatively short length trending north in the north end and north-northwest in the south.
6	+800 - +2,000γ	A broad linear zone striking east-northeast across the centre of the area.

On the basis of magnetic character, extrapolation of regional geology and detailed geology of old prospects, the magnetic units can be equated with geologic units as follows:

<u>Magnetic Unit</u>	<u>Lithology</u>
1a	Chemical sediments with a high proportion of minerals such as magnetite or pyrrhotite, typically iron formation.
1b	Less magnetic versions of 1a.
2a	Mafic to ultramafic rocks -- probably flows.

<u>Magnetic Unit</u>	<u>Lithology</u>
2b	Mafic to ultramafic rocks -- probably intrusives as a more homogeneous internal character than 2a.
3	Undifferentiated intermediate rocks probably largely of volcanic origin.
4	Felsic intrusives of granitic character.
5	Dykes. Diabase?
6	Dykes. Olivine Diabase?

The overall picture, therefore, is of a volcanic belt of largely intermediate volcanics with some mafic to ultramafic units along the east side and a series of narrow bands of chemical sediments interbedded within the intermediate volcanics. Granites form the east and west flanks of the belt and have invaded the belt in the central section. Later dykes cut all other rock types. Dips of units are steep to vertical.

Several structural breaks are evident trending north, north-northwest, east-northeast and east-southeast. Intrusive units have tended to follow these trends, but are also truncated or offset in several instances suggesting repeated fault movement over considerable time.

9.3 CONCLUSIONS AND RECOMMENDATIONS

The magnetic survey has been successful in defining the trends and distribution of units of chemical sediments including iron formation which are believed to be favourable hosts for massive sulphide mineralisation. Follow-up should be directed at those units to isolate conductive sulphide masses by electromagnetic means.

In addition, the survey has identified areas of possible mafic to ultramafic rocks which may have potential for Ni, Cu mineralisation. Geologic mapping should be undertaken in those areas to confirm the existence of such rock types, in particular, in the north where Unit 2a has a series of local magnetic highs along its west contact.

CERTIFICATE

I, Gerald Harper, of 26 Orchard Crescent, Toronto, Ontario M8Z 3E1, hereby certify that,

- 1) I hold a Bachelor of Science degree in Geology from the University of Rhodesia and a Doctor of Philosophy degree in Geology from the University of London, England.
- 2) I am a Registered Professional Engineer in good standing, in the Province of Ontario.
- 3) I have practised my profession in exploration continuously for the past 16 years, since graduation.
- 4) I am presently Chief Geologist for North American Exploration for Northgate Exploration Limited of P. O. Box 143, 1 First Canadian Place, Toronto, Ontario M5X 1C7.
- 5) I have based conclusions and recommendations contained in this report on knowledge of the area, my previous experiences with the geophysical technique used and on the results of the field work conducted on the property in the last quarter of 1981 which was carried out under my supervision.

G. Harper, Ph. D.

Magnetics - Ground

MP-2 Portable Proton Precession Magnetometer

The MP-2 is a portable one gamma proton precession magnetometer for field survey or base station use. The optimized design of sensor and circuitry using the latest COS/MOS components has resulted in a very light weight, low power consumption, rugged and reliable magnetometer.

1 gamma sensitivity and accuracy over range of 20,000 to 100,000 gammas.

Operates in very high gradients, to 5,000 gammas per meter.

Weighs only 3.7 kg.

Up to 25,000 readings from only 8 D cells.

Battery pack isolated from electronics for corrosion protection.

Battery pack easily extended for winter use.

Light emitting diode digital display, with complete test feature.

Reads out in only 3.7 seconds.

Unique no-glare polarized reflector permits easy reading in bright sunlight.

Indicator light warning of excessive gradient, ambient noise or electronic failure.

Digital readout of battery voltage.

Rugged all metal housing for rough field use at all temperatures.

Automatic recycling or external trigger features permit ready conversion to base station use in the MBS-2 model.

Magnetismo - Terrestre Magnétisme - Au sol

MP-2 Magnetómetro Portátil de Protones

MBS-2 Total Field Magnetic Base Station

The MBS-2 is a compact, portable, self powered, total field magnetic base station which incorporates the MP-2 Portable Proton Precession Magnetometer. It is designed and constructed to operate for extended periods at remote locations under a variety of environmental conditions.

The MBS-2 may be used as a base station for ground and airborne magnetic surveys, in observatories as well as for land, air and sea mobile surveying.

One gamma sensitivity and accuracy over the range of 20,000 to 100,000 gammas.

Operates in very high gradients, to 5,000 gammas per meter.

Internal D cell power supply allows approximately 80 hours of operation. Alternatively, external power sources can be used.

Analog recording output is switch selectable at 10, 100 or 1,000 gammas full scale.

Digital output for interfacing with cassette or computer compatible magnetic tape recorders.

Automatic sampling intervals are variable from two seconds to ten minutes. Alternatively, manual or remote clock commands can be used for any sampling interval greater than two seconds.

Timing pulses are automatically shown each ten minutes on the analog strip chart.

Automatic stepping ensures no off scale analog traces.

MBS-2 Estación Base Magnética de Campo Total

El MBS-2 es una estación base magnética, de campo total, portátil, compacta y auto-energizada que incluye al Magnetómetro Portátil de Precesión de Protones MP-2. Está diseñada y construida para operación durante largos períodos y en localidades remotas, bajo diversas condiciones climáticas.

La unidad MBS-2 puede ser usada como una estación base para trabajos magnéticos de tipo aéreo y terrestre, sea en observatorios o trabajos móviles en aire, mar o tierra.

Tiene una precisión y sensibilidad de 1 gamma en todo el rango desde 20,000 hasta 100,000 gammas.

Opera en condiciones de alto gradiente magnético, hasta de 5,000 gammas por metro.

Una fuente interna de energía con baterías de tipo D permiten aproximadamente 80 horas de operación. Puede usarse una fuente de energía externa, alternativa.

La salida para registro analógico puede seleccionarse entre 10, 100 o 1,000 gammas para escala total.

La salida digital puede interconectarse a registradores magnéticos tipo cassette u otro registro magnético compatible con un computador.

Los intervalos de muestreo automático pueden seleccionarse desde 2 segundos hasta 10 minutos. Como alternativa, pueden utilizarse comandos manuales o de reloj para un muestreo superior a dos segundos.

Salidas de pulsos de tiempo son automáticamente grabadas en la banda de papel de registro, cada 10 minutos.

Un escalonado automático permite trazas analógicas siempre dentro de escala.

MBS-2: Station magnétique fialemente

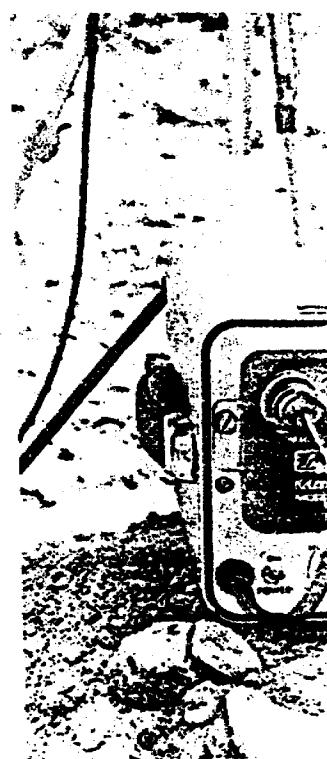

L'appareil MBS-2 est une station magnétique de champ total, compacte, portative, à propre qui incorpore le magnétomètre de précession de protons portable de type MP-2 et construit pour fonctionner pour de longues périodes de temps dans des lieux éloignés des conditions d'environnement variées.

L'appareil MBS-2 peut être utilisé en station fixe pour des levés magnétiques terrestres, aériens, dans les observatoires ainsi que pour des levés mobiles, au sol, aériens et en mer.

Une sensibilité et une précision de 1 gamma sur une gamme de 20.000 à 100.000 gamma.

L'appareil opère dans des gradients jusqu'à 5.000 gamma par mètre.

L'alimentation interne à piles "D" permet une opération de 80 heures environ. Ainsi, des alimentations externes peuvent être utilisées.

MBS-2: Station magnétique fixe à champ total

L'appareil MBS-2 est une station magnétique fixe à
champ total, compacte, portative, à alimentation
propre qui incorpore le magnétomètre à précision
de protons portable de type MP-2. Il est conçu
et construit pour fonctionner pour de longues
périodes de temps dans des lieux éloignés et dans
des conditions d'environnement variées.

L'appareil MBS-2 peut être utilisé en tant que sta-
tion fixe pour des levés magnétiques au sol et
aériens, dans les observatoires ainsi que pour des
levés mobiles, au sol, aériens et en mer.

Une sensibilité et une précision de 1 gamma sur
une gamme de 20.000 à 100.000 gamma.

L'appareil opère dans des gradients très élevés
jusqu'à 5.000 gamma par mètre.

L'alimentation interne à piles "D" permet une
opération de 80 heures environ. Alternativement,
des alimentations externes peuvent être utilisées.

Le calibre de sortie d'enregistrement analogique
choisi par sélecteur est de 10, 100 ou 1.000 gamma.

Une sortie numérique pour liaison avec des
enregistreurs à cassette ou à ruban magnétique
compatible avec un ordinateur.

Les intervalles de mesure automatiques sont
variables de deux secondes à dix minutes. Alter-
nativement, des commandes d'horloge manuelles
ou à distance peuvent être utilisées pour tout inter-
valle de mesure plus long que deux secondes.

Des impulsions de synchronisation sont automati-
quement marquées chaque dix minutes sur le
papier millimétré.

Les décalages automatiques assurent des traces
analogiques en-dedans de l'échelle.

Re: Your Ref. No. 2.4765 & 2.4766

Dear Sir:

Please find enclosed the signed maps for your file No. 2.4765.

As for file No. 2.4766 I have included the Assessment Work Breakdown and the claims to which the tags are to be applied (I believe you mentioned during our conversation that you didn't see an attached claims list). Time sheets are discarded after one year so exact dates of the work are not available; however it was all in Nov.-Dec. 81.

If anything else is missing from the file, please don't hesitate to call me.

Yours truly

NORTHGATE EXPLORATION LIMITED

Dear Sir:

RE: Geophysical (Magnetometer) Survey submitted on
Mining Claims P 591928 et al in the Townships
of Price, Fripp & McArthur.

Enclosed are the Magnetometer plans (in duplicate) pertaining to the above mentioned report. Please sign each map and return them to this office. We note that the work was recorded with the Porcupine Mining Recorder on May 19, 1982, under the Man Days method. Please, therefore, complete and return the enclosed forms, providing us with a Man-Days assessment work breakdown.

For further information please contact Mr. F.W. Matthews at 416/965-1380.

Yours very truly,

E.F. Anderson

Dear Sir:

We have received reports and maps for a Geophysical (Magnetometer) Survey submitted under Special Provisions (credit for Performance and Coverage) on Mining Claims P 591928 et al in the Townships of Price, Fripp, and McArthur.

This material will be examined and assessed and a statement of assessment work credits will be issued.

Yours very truly,

E.F. Anderson

A standard linear barcode is positioned horizontally across the page, consisting of vertical black bars of varying widths on a white background.

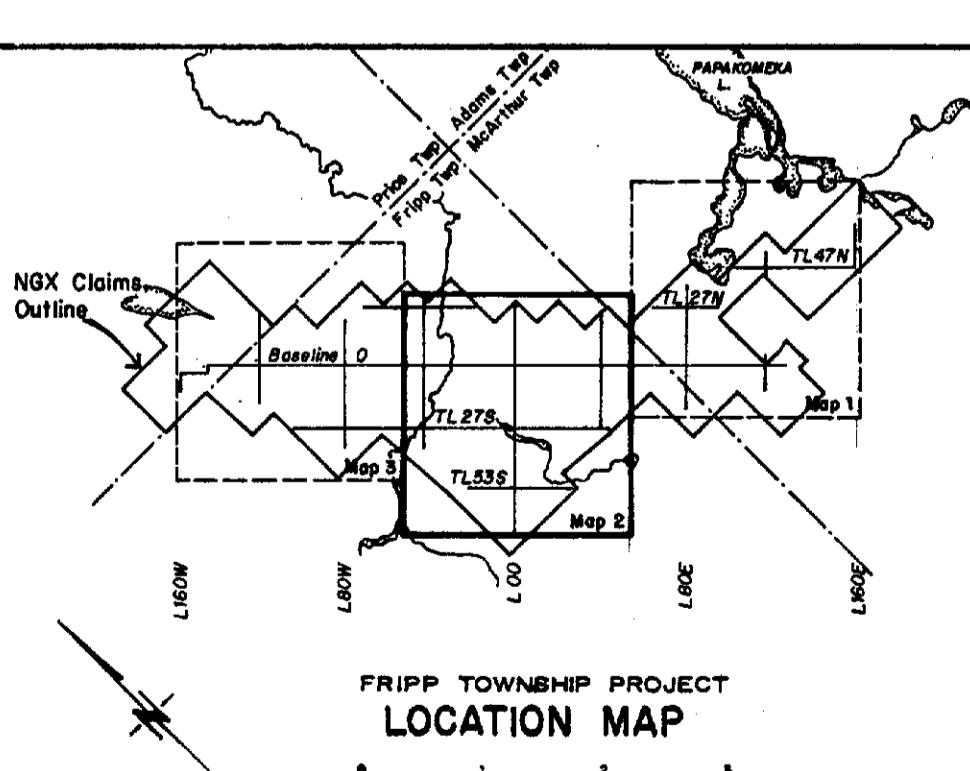

Note: Add 59,000 gammas on all readings

Scale 1: 4800

The scale bar consists of two horizontal lines. The top line is labeled "FEET 500" at the left end and "1000 FEET" at the right end. The bottom line is labeled "METERS 150" at the left end and "300 METRES" at the right end. Both lines have tick marks every 10 units, with "0" explicitly labeled at the center of each line.
