1.0 Introduction and Summary

In November 1996, a series of four diamond drill holes totalling 1198 metres of BQ core were used to test geophysical and geological targets on the Timmins-Michie Property held by Royal Oak Mines Inc. (5501 Lakeview Drive, Kirkland Washington 98033 USA) under an option agreement from East West Resource Corporation and Cross Lake Minerals and Canadian Golden Dragon Resources Ltd.

The holes were designed to build up the geological database on the property initiated in early 1996 when Royal Oak drilled the first three holes on the property.

The first two holes were drilled on the main IP trend, the dominant geophysical feature on the surveyed portion of the property. This trend lies across the property at an azimuth of about 360° and is centred on Dougherty Lake. Hole TT96-4, at the south end of this feature, and Hole TT96-16, at the north end of it, both cored tuffaceous sediments and argillites similar to those seen in the first three holes drilled on the property. Disseminated sulphide mineralization within the argillites is the probable cause of the IP anomalies tested by these two holes. The final two holes were drilled underneath the massive sulphide and sericite schist zones which are adjacent to a 100m wide diabase dike. Both holes cored mafic volcanic pillow lavas and breccia, which are variably altered with silica, epidote and hematite, and contained intervals of sulphides in stringers and blebs. A total of 313 samples were taken from the drill core and analysed for gold at Swastika Labs.

2.0 Location and Access

The Timmins-Michie property consists of 25 claims in Timmins Township and 11 claims in Michie Township and totals 463 units or about 7328 ha in size. The property is located about 50 km south-east of Timmins and is accessed via the Gibson Lake Road by driving 30km south from Highway 101. Refer to Figures 1 and 2. Table 1 is the claim list for property.

3.0 Previous Work

Previous work on the property includes a 280km grid with complete coverage by a total field magnetic survey completed by East West Resource Corp. in 1994. East West, and later Royal Oak, had IP surveys completed on the central portion of the grid. Three holes were drilled on the property by Royal Oak during December 1995 and January 1996, results of which were detailed in a report written by the author and submitted for assessment credits on May 24, 1996.

4.0 Geology

The property covers about 15km of a 5km wide north-west trending volcanic sequence in Timmins and Michie Townships. The sequence is sandwiched between two granite batholiths and is truncated to the north by a third. North trending diabase dikes obliquely cut the volcanic sequence.

Geological knowledge on the property is hampered by thick overburden. The esker which extends south from Kettle Lakes Provincial Park covers the central and eastern portion of the property with a thick mantle of sand, and the western portion is dominated by spruce and tamarack swamp.

The only significantly large area of bedrock exposure lies south-west of Dougherty Lake on claim 1193700. Here an area about 800m x 400m reveals that the bedrock consists dominantly of mafic volcanics intercalated with felsic volcanics which have been structurally deformed and altered to sericite schists. These sericite schist zones trend at about 300° and dip 70° NE. Trenches and pits dating back several decades expose this geology, and locally quartz veining and semi-massive to massive pyrite within the sericite has been noted. Several diabase dikes trending at 345° are also exposed in this area.

Sediments and mafic volcanics were cored in the three holes drilled by Royal Oak as documented in a report by the author dated May 24, 1996. Sulphide mineralization, consisting of pyrite, pyrrhotite, sphalerite, chalcopyrite and galena were observed in the core occurring in quartz veins and fractures fillings within the sediments.

5.0 November 1996 Drill Program

Commencing on November 4 and finishing November 19 1996, NDS Drilling of Timmins completed four BQ drill holes totalling 1198m to test both geophysical and geological targets. All holes were drilled grid south and collared at -50°.

5.1 TT96-4

The first hole was collared on Line 20+00E at 2+35S to target an IP anomaly between 3+00S and 4+25S. The hole had 76m of sand overburden, and was drilled to a depth of 288.0m.

From 76.0 to 191.3m the hole cored tuffaceous sediments, a chlorite-biotite-garnet schist as was seen in the holes drilled earlier in the year. The sediments were intercalated with argillite from 76.0 to 82.3m, and quartz veinlets containing pyrite, pyrrhotite and sphalerite were noted here. Sulphides are also common as fine dustings on bedding planes through the argillite.

The interval between 191.3 and 205.1m contained lapilli tuff, argillites and chert (exhalite), locally mineralized with disseminated and bedded pyrite. An 8.5m diabase sill was located near the bottom part of this sequence.

The hole ended in tuffaceous sediments similar to those near the top of the hole, but they were silicified and contained feldspar phenocrysts. The probable cause of the IP anomaly is the mineralized lapilli tuff, chert and argillite sequence between 191.3 and 205.1m.

5.2 TT96-16

The second hole drilled was on Line 4+00E at 19+00N, had 85m of sand overburden, and was drilled to 301m.

Bedrock between 85.0 and 136.0m was typical, chloritic tuffaceous sediments. Between 136.0 and 148.4m, the hole cored a crystal tuff, an ash tuff, and a chert exhalite horizon. The tuffs were locally mineralized with pyrite and pyrrhotite stringers, and a 10cm long interval of massive pyrite was cored within the chert exhalite between 148.0 and 148.1m.

From 148.4m to the end of the hole, a thick argillite package was drilled. The argillite was generally well laminated, and variations within it were due to changing amounts of graphite and local silicification. The entire package contained 5-50 % of a 1mm sized white, angular crystalline mineral throughout which gives the unit a "snowflake" texture. This mineral is thought to be some type of a carbonate. Sphalerite mineralization, occurring in low angle quartz veins and fractures, is common throughout the argillite, and is best seen at 167.7-173.4m (a fault zone), 184.0-185.5, and 235.0-255.0m. Chert beds intercalated with the argillite are common between 242.9 and 253.5m, and sphalerite occurs on the chert interbeds at 252.0-253.5m.

5.3 TT96-14

The third hole was drilled on Line 2+00E at 5+10N, at the edge of the area of outcrop south-west of Dougherty Lake, and went to a depth of 311.0m. Historic trenches in the area near Line 1+00E at 4+00N have exposed sulphide mineralization in this area which also has a weak IP response.

The hole cored amygdaloidal pillow lavas to 116.0m, altered with biotite and chlorite, and contained intervals of silicification. Between 116.0 and 118.0m was a sulphide zone, containing stringers and blebs of pyrrhotite and pyrite with a siliceous pillow breccia/fragmental horizon. Below the sulphide zone are amygdaloidal pillow lavas, altered with chlorite, biotite and containing albite phenocrysts. Local variations in this unit between 118 and 231.5m include intervals of 1-5% disseminated pyrite, lapilli tuff, and narrow, fine grained diabase.

Between 231.5 and 241.5m, the pillow lavas are brecciated, and show a strong epidote alteration and contain 2-3% pyrite. Pyrite-epidote "stringers" 1-2cm wide, envelop the fragments. At 237.4 to 240.1m a red fine grained syenite dike cuts the volcanics.

The large, coarse grained diabase observed in outcrop near the historic trenching was cored between 241.5 and 298.6m.

From 298.6 to the end of the hole at 311.0m, the hole cored silica-epidote altered mafic volcanics with trace - 5% pyrite, which is similar to that cored on the north side of the dike.

5.4 TT96-15

The fourth and final hole of the program was collared on Line 3+00E at 1+90N, and collared in the diabase cored in TT96-14.

From 40.9-47.5m, at the "out" contact with the diabase, the hole cored siliceous mafic volcanics with pyrite-epidote stringers similar to that seen adjacent to the diabase in hole TT96-14. The interval from 47.5 to 79.0m had similar, but progressively weaker alteration compared to that seen closer to the diabase. From 79.0m to the end of the hole at 298.0m, the hole cored amygdaloidal pillow lavas, with moderate chlorite-biotite alteration. Intervals of 2-3% disseminated pyrite occur at 100.0 to 103.0m and 121.0 to 128.0m. A narrow feldspar porphyry dike was cored between 203.7 and 204.4m, and an interval of shearing and fault gouge material was seen between 204.4 and 215.0m.

5.5 Assay Results

The drill core was extensively sampled, and in all a total of 313 samples of both sawn core and grab samples were taken from the four holes and sent to Swastika Labs for analysis. Assay results were disappointing, despite significant pyrite and base metal mineralization, the best assay returned from the program was 0.004 opt Au/1.5m from hole TT96-4 at 77.5 to 79.0m.

6.0 Conclusion and Recommendations

The drill program was successful in expanding the geological knowledge of the property and explaining some of the IP anomalies occurring on it. Additionally, two holes were drilled to provide a complete geological section under the historic trenches which expose base-metal and gold mineralization.

Gold assays were disappointing, however the extensive base metal mineralization seen in veins and fracture fillings containing sphalerite and galena within the sediments, along with chert interbeds within these sediments, matrix silicification, and indications of hydrothermal alteration, suggest a nearby base-metal deposit.

Further work is therefore recommended, directed towards locating a base-metal deposit, and would include electromagnetic surveys (ground or airborne), continued IP surveys both north and south of the existing coverage, as well as diamond drilling on selected geophysical targets.

Statement of Qualifications

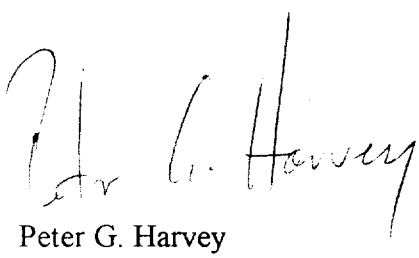
I, Peter G. Harvey, of Timmins, Province of Ontario, do hereby certify that:

1. I received a B. Sc. degree (Honours) in Geology from Lakehead University, Thunder Bay, Ontario, in 1985.

2. I have been employed as a geologist by various mining companies in Ontario since 1985.

3. I am the author of this report.

4. I have no direct interest, nor do I have any shares of any company exploring the properties described in this report, nor on any adjacent properties.



Peter G. Harvey
Project Geologist
Eastern Canada Exploration
Royal Oak Mines Inc.

Appendix

Legend

Drill Hole Plan Maps, Logs and
Assay Certificates

Drill Hole Sections

GENERAL PROCEDURES

Orient core and list footage intervals for each box. This list should be given to Al Lacroix for tagging purposes.

MAJOR CATEGORIES ON LYNX COMPUTER LOG

DIST (Distance at bottom of interval)

Sample intervals should not exceed 5 feet (1.5m). Other intervals may be longer. When resampling is required, add the sample distance, description, etc., to the bottom of the log. New sample intervals can be inserted in the appropriate spot on the log in the computer.

ID (Identification)

These two spaces can be used to put numbers/codes corresponding to rock name/possible faults/structure, etc., which can be referred to at a glance.

RQ-RQD

RQD is an estimated percentage of pieces of core in a sample length which are as long or longer than: AQ = 3", 7.5 cm; BQ = 4", 10 cm; NQ = 5", 12.5 cm. This should represent only natural breaks.

ROCK DESCRIPTION

COM (Competency)

M	Massive, will not break without considerable effort
S	Breaks roughly on shear planes
SS	Breaks easily
SSS	Breaks in hands without effort
B	Broken/blocky
F	Fractured
G	Gouge/fault

GRS (Grain Size)

VFG	Very fine grained	
FG	Fine grained	aphanitic
FMG	Fine medium grained	aphanitic
MG	Medium grained	aphanitic
MCG	Medium coarse grained	aphanitic
CG	Coarse grained	phaneritic
VCG	Very coarse grained	phaneritic

TEXT (Texture)

VAR	Variolitic - globular structures of devitrified glass (basic)
SPH	Spherulitic - globular structures of devitrified glass (acid)
POIK	Poikilitic - small grains floating in one large grain
OPH	Ophitic - euhedral/subhedral feldspar embedded in pyroxene xtal
DIA	Diabasic/doleritic - lath-like feldspar with pyroxene between
POR	Porphyritic - large phenocrysts in fine-grained matrix
GLOM	Glomeroporphyritic - phenocrysts occur in clusters
SERI	Seriate - complete grain range from matrix to phenocryst
AMYG	Amygdaloidal - vesicle filled with minerals

ALIG	Alligator	MOTL	Mottled
BLOT	Blotchy	NED	Needled
BND	Banded	SHD	Sheared
BRX	Brecciated	SPT	Spotted

13 IRON FORMATION

IFo	Oxide
IFs	Sulphide (py-po)
IFc	Carbonate
IFj	Jasper
BIF	Banded iron formation
IFchl	Chlorite-rich
IFgr	Graphitic

These abbreviations are used after a lithology name, if desired ("Nam" column must be limited to 5 characters). Allows alteration to be shown with name when drill hole is plotted.

3m,s	Would denote a massive calc-alkalic mafic volcanic which is sericitized
chl	Chloritic
chty	Cherty
s or ser*	Sericitic
sil	Silicified
ank	Ankerite
cc	Calcite
c	Carbon
cb	Carbonate
h	Hematite
alb	Albitized
fu	Fuchsitic
mt	Magnetite
sh	Sheared
tcb	Talc carbonate schist
tcs	Talc chlorite schist
gr	Graphitic
arg	Argillaceous
sch	Schist
gt	Garnet
oxd	Oxidized
bl	Bleached
epd	Epidote
serp	Serpentinized

* where computer space permits, use **ser**

Note: In addition to the percentage of quartz veins being indicated, one should indicate in the Comments column whether the veining is tensional (i.e. cutting foliation) or of the strike variety (i.e. parallel to foliation) or both. For example "10% qtz (t)" or "15% qtz (t + s)".

SULPHIDES

DS	Disseminated sulphides
SS	Stringer sulphides
MS	Massive sulphides
SMS	Semi-massive sulphides

OXIDES

Mt	Magnetite (80-100%)
QAV	Quartz ankerite veining

NAM2

This column has been added to accommodate future changes in geology names.

FORM

A formation column has been added to accommodate extensive geological naming practices. FORM will be used to plot geology, and must be limited to a maximum of eight names or numbers (for the 8 plotter pens).

STRUCTURE

B/S	S	Schistosity	C	Contact
	F	Foliation	V	Vein (primary if more than one occurs)
	B	Bedding		

J/F	J	Joint Plane
	V	Vein (secondary if more than one occurs)
	F	Fault Plane/Fracture

A1/A2

Measurement of above with respect to core axis (C.A.)

MINERALS

GANGUE

ACT	Actinolite	GAR	Garnet
ANH	Anhydrite	HBL	Hornblende
ANK	Ankerite	LEU	Leucoxene
BIO	Biotite	MUS	Muscovite
CC	Calcite	PYR	Pyroxene
CAR	Carbonate	QC	Qtz Carbonate
CHL	Chlorite	QTZ	Quartz
DOL	Dolomite	SER	Sericite
EPD	Epidote	SPR	Serpentine
FSP	Feldspar	TOU	Tourmaline
FUC	Fuchsite		

METALLIC

ASP	Arsenopyrite
CPY	Chalcopyrite
GN/GA	Galena
GRA	Graphite
HEM	Hematite
PO	Pyrrhotite
PY	Pyrite
SID	Siderite

S	Sludge

COMMENTS

Standard abbreviations should be used where possible so that anyone can refer to this "dictionary" and clearly read the logs. If abbreviations are being used that are not included on this list, please add them.

ANH	Anhedral
BLB	Blebs
BL-QTZ	Blue Quartz
CA	Core Axis
CV	Carbonate Vein
DEFMD	Deformed
DIS	Disseminated
EUH	Euhedral
EXT	Extensive
FOL	Foliation
FUCH	Fuchsite
GRND	Ground (core)
>	Greater Than
IC	In Contact
IVC	In Vein Contact
IRR	Irregular
<	Less Than
MAG	Magnetic
MNR	Minor
MOD	Moderate(ly)
NOD	Nodules
OCC	Occasional
OC	Out Contact
OVC	Out Vein Contact
PLL	Parallel
QCV	Qtz-Carb Vein
QV	Quartz Vein
RXN	Reaction
STR	Strong
STK	Stockwork
STG	Stringer
SUB	Subhedral
TR	Trace
TW	True Width
VNS/VN/V	Veins
VLETS	Veinlets
W	With
WO	Without
WK(LY)	Weak(ly)

ASSAY

Suggested usage for assay columns

AU1	PPB
AU2	Fire Assay (use **FA1** column if available)
ASSAY3, etc	To be used if there is a need to show a relationship with gold, otherwise geochemical analysis is available on other systems

I, _____ (Print Full Name), do hereby certify that the above work credits are eligible under subsection 7 (1) of the Assessment Work Regulation 6/96 for assignment to contiguous claims or for application to the claim where the work was done.

Signature of Recorded Holder or Agent Authorized in Writing	Date
Pete Harvey	Dec 20 '96

6. Instructions for cutting back credits that are not approved.

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- ☑ 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- ☑ 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- ☐ 3. Credits are to be cut back equally over all claims listed in this declaration; or
- ☐ 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.

Transaction Number (office use): W9660.00843

Personal information collected on this form is obtained under the authority of subsection 6(1) of the Assessment Work Regulation 6/96. Under section 8 of the Mining Act, the information is a public record. This information will be used to review the assessment work and correspond with the mining land holder. Questions about this collection should be directed to the Chief Mining Recorder, Ministry of Northern Development and Mines, 6th Floor, 933 Ramsey Lake Road, Sudbury, Ontario, P3E 6B5.

Work Type	Units of Work Depending on the type of work, list the number of hours/days worked, metres of drilling, kilometres of grid line, number of samples, etc.	Cost Per Unit of work	Total Cost
Diamond Drilling	1198 m	$ 56.84/m	$ 68,089
Swastika Labs	313 samples	$ 12.31/each	$ 3,851
Labor - sampling etc.	10 man days	$ 150/day	$ 1,500
Supervision, report etc.	30 man days	$ 225/day	$ 6,750
Associated Costs (e.g. supplies, mobilization and demobilization).			
200 Core boxes		6.69/box	$ 1,337
Core storage, saw blade etc.			$ 800
Transportation Costs			
Truck, gas etc			$ 750
Food and Lodging Costs			
		Total Value of Assessment Work	$ 83,077

Calculations of Filing Discounts:

1. Work filed within two years of performance is claimed at 100% of the above Total Value of Assessment Work.
2. If work is filed after two years and up to five years after performance, it can only be claimed at 50% of the Total Value of Assessment Work. If this situation applies to your claims, use the calculation below:

TOTAL VALUE OF ASSESSMENT WORK × 0.50 = Total $ value of worked claimed.

Note:
- Work older than 5 years is not eligible for credit.
- A recorded holder may be required to verify expenditures claimed in this statement of costs within 45 days of a request for verification and/or correction/clarification. If verification and/or correction/clarification is not made, the Minister may reject all or part of the assessment work submitted.

Certification verifying costs:

I, Peter G. Harvey (please print full name), do hereby certify, that the amounts shown are as accurate as may reasonably be determined and the costs were incurred while conducting assessment work on the lands indicated on the accompanying Declaration of Work form as Project Geologist (recorded holder, agent, or state company position with signing authority) I am authorized to make this certification.
