GEOPHYSICAL REPORT

MACKLEM & BOND TOWNSHIPS PROPERTY
GOLDEIDT EXPLORATIONS INC.

RECEIVED

MAR 11 1983

MINING LANDS SECTION

November 17, 1982

INTRODUCTION

During the months of July and October 1982, electromagnetic (VLF-EM) and magnetometer surveys were conducted over two claim blocks held by Goldeidt Explorations Inc. Linecutting was performed during July 1982 on the claims by Mid-Canada Explorations Ltd., a Timmins contracting firm. The geophysical surveys were carried out by Goldeidt personnel.

Survey results and claim block locations are shown on maps accompanying this report.

LOCATION & ACCESS

The properties comprise blocks of 30 and contiguous claims, some 22 miles east of Timmins, Ontario in the eastern part of MacKlem Tp. and western part of Bond Township and the central part of MacKlem Tp. Access is easily provided by Highway 101 and the Gibson Lake Road which crosses through the main claim block.

OWNERSHIP

The claim blocks are owned by:

Goldeidt Explorations Inc.
c/o R. Sibthorpe
P. O. Box 25
Toronto-Dominion Centre
TORONTO, Ontario M5K 1B5

Contracting services employed were:

Mid-Canada Exploration Services Ltd.
8-251 Third Avenue
TIMMINS, Ontario

This report has been prepared on behalf of Goldeidt Explorations Inc. by Mr. Robert Sibthorpe. The writer graduated in 1973 with a B.Sc. (4-year, Hons.) in geological sciences from the University of Toronto and has been engaged in the mining industry since that date. The writer also spent one full year in the Timmins area performing and interpreting geophysical sciences from the University of Toronto and has been engaged in the mining industry since that date. The writer also spent one full year in the Timmins area performing and interpreting geophysical surveys for a major Canadian mining company and personally supervised the work outlined in this report.

CLAIM NUMBERS

P486658 - P486677	P530615 - P530618
P530623 - P530626	P530631 - P530632
P530652 - P530653	P530660 - P530661
P530668 - P530669	P530676

GENERAL GEOLOGY

The grid area is covered by a thick mantle of glacio-fluvial sediments and no outcrop was noted on either grid. ODM Map 2222, Nighthawk Lake Area, indicated that the claim block is underlain by Archean mafic to intermediate volcanics. Airborne magnetic surveys indicate the presence of a diabase dike traversing the northwest corner of the easternmost claim block.

PREVIOUS WORK

A survey of the Ontario assessment work files did not disclose any record of previous work on the area covered by the claims.

RESULTS & CONCLUSIONS

Magnetometer Survey - Eastern Block

The survey confirmed the presence of a northeasterly trending dike in the northwest corner of the claim block and detected the presence of another in the west-central portion. Elsewhere the magnetic relief show relatively minor variation other than a gradual decline in values towards the Southeast. A local magnetic anomaly was found in the south central part of the grid and is attributed to either a change in underlying rock type or a local reduction in the depth of overburden which covers the entire grid.

- Western Block

Very little magnetic variation was noted on these claims.

Electromagnetic Survey

The results of the EM-16 very low frequency survey were negative over both claim blocks in that no definite conductive zones were revealed. Several weak non-persistent conductors were found but these response are likely due to overburden effects since the area is believed to be underlain by 100-200 feet of sand and clay.

INSTRUMENT & SURVEY DATA

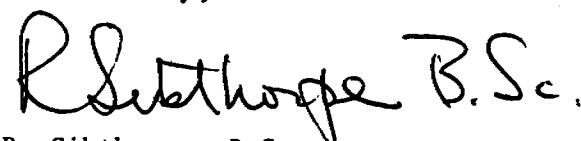

The surveys were carried out over a newly established grid. Lines were cut in a north-south direction every 400 feet with stations every 100 feet. A total of 26.1 miles were cut over the eastern claim block and 5.7 miles on the western block.

The magnetometer survey was carried out using two Geometrics G-816 Magnetometers capable of measuring variations in the vertical component of the earth's magnetic field to ± 1 gamma. Readings were taken every 50 feet. A daily curve of the diurnal was recorded by repeating control points at convenient intervals during the day. A total of 1,584 readings were taken on the eastern grid and 353 on the western grid.

The electromagnetic survey employed a Geonics EM-16 V.L.F. unit designed to measure in-phase and quadrature components of the anomalous field from electrically conductive zones. A total of 1,367 and 353 readings were taken on the eastern and western grids respectively.

Stations were read at 100 foot intervals reading north. The method uses the radiation from a military radio transmitter at low frequencies. The station used in this survey is located at Cutler, Main. The instrument has two receiving coils measuring the vertical in-phase component (tilt angle) and the vertical out-of-phase component (quadrature). The interpretation of the results uses the relative measurements of these two parameters to outline and define conductors.

Dear Sir:

We have received reports and maps for a Geophysical (Electromagnetic & Magnetometer) Survey submitted under Special Provisions (Credit for Performance and Coverage) on Mining Claims P 486658 et al in the Townships of Macklem and Bond.

This material will be examined and assessed and a statement of assessment work credits will be issued.

We do not have a copy of the report of work which is normally filed with you prior to the submission of this technical data. Please forward a copy as soon as possible.

Yours very truly,

E.F. Anderson
