PART A

EXECUTIVE SUMMARY:

The Four Corners Property located in Robb, Turnbull, Jamieson and Godfrey Townships consists of a group of 17 mining claim units in the Kamiskotia Area of Timmins, Ontario. An additional mining claim unit was staked on June 2, 2004.

The property is owned 100% by Messier Pat Gryba and Herman Daxl. The surface rights are owned by various land owners with the exception of one mining claims, P-3011006.

The project area is approximately 21.4 km (13.4 miles) northwest of the City of Timmins, Ontario. Timmins city center is approximately 21.8km (13.6 miles) west of Falconbridge Ltd. metallurgical site and approximately 467 km (290 miles) north of Sudbury, Ontario.

Four massive sulphide deposits hosted in the Kamiskotia Volcanic Complex have been mined for their copper-zinc +/-gold +/-silver content, namely the Kam-Kotia Mine, Jameland Mine, Canadian Jamieson Mine and the Genex Mine.

The Kamiskotia Gabbroic Complex (KGC) is a large deformed tholeiitic intrusive complex situated centrally in the Kamiskotia area. It is overlain by and in part gradational with metavolcanic rocks of the Kamiskotia Volcanic Complex (KVC) which includes basalt and rhyolite. Granitoid masses composed of hornblende +/- biotite tonalite to granite have intruded the stratigraphy.

The property has a large sill like gabbroic body intruded by several felsic porphyry dikes and a north-northwest trending diabase dike. Two notable porphyries in Jamieson Township contain gold mineralization which are the "North of Old Highway" gold showing and the "Rusty Bucket" gold showing hosted in a carbonated and quartz veined aplite to feldspar to quartz feldspar porphyry.

In the central portion of the property, near the junction of Jamieson, Turnbull and Godfrey Townships are 2 sub-parallel shear zones trending in a northeasterly direction. These shear zones host the Zinc No.1 and Zinc No.2 zones.

In the western portion of the property in Robb Township is a newly discovered copper-nickel mineralization hosted in the gabbroic body or dunite.

The due diligence property examination included prospecting and sampling by Kevin Keith and Dion Wade from May 14, 2004 to June 10, 2004, detail mapping and supervision of the chip and channel sampling by Kian A. Jensen, P.Geo. May 23, 2004 to June 9, 2004.

Geoserve Canada Inc. completed approximately 8.9 km of line cutting and an Induced Polarization (IP) surveying with an a spacing of 25 metres reading N=1 to N=6. Grid lines 800 North and 1000 North were also surveyed with Total Field Magnetic survey and Horizontal Loop Electromagnetic (HLEM) survey method with a coil separation of 150 metres. The grid and surveying commenced on May 23, 2004 and completed by June 15, 2004.

The highest seven gold values were obtain from the North of Old Highway showing ranging from 0.134 opt to 4.215 opt gold. These are followed by 0.121 opt gold from Zinc Vein No.1 and 0.104 opt gold from the Rusty Bucket gold showing.

The silver values ranged from 12 g/t up to 29 g/t silver from both the Zinc Vein No. 1 and Zinc Vein No.2 showings and a high of 12 g/t from the North of Old Highway gold showing.

The copper – nickel showing returned values ranging from 2835 ppm to 0.645% copper, 1523 ppm to 4448 ppm nickel and 115 to 332 ppm cobalt with elevated values from 3945 ppm to 8729 ppm titanium and 40 ppm to 73 ppm vanadium.

initially

The highest value of zinc was obtained from Zinc Vein No.2 with a value of 8.44% zinc and several values from 1.897% to 1.95% zinc. Zinc Vein No.1 due to the excellent exposure returned 5 of the highest values ranging from 1.814% zinc to 7.447% zinc, then <36% Zn, 4.24 g/t Au, 50 g/t Ag, over 40 cm (Page 32).

A program of channel sampling was conducted at the North of the Old Highway Gold Showing and Zinc Vein No.1.

LOCATION AND ACCESS:

The project area is approximately 21.4 km (13.4 miles) northwest of the City of Timmins, Ontario. Timmins city center is approximately 21.8km (13.6 miles) west of Falconbridge Ltd. metallurgical site and approximately 467 km (290 miles) north of Sudbury, Ontario as illustrated in Figure 1.

The property lies within NTS map sheets 42A/12 with the center of the property at approximately Latitude $48^{\circ} 32.5'$ and Longitude $81^{\circ} 35.75'$.

Access to the property is via Highway 101 West 8.3 km from Timmins city center and then northwestwards along Highway 576 for 16.8 km to the Robb and Jamieson Township boundary. Additional access is by a cut all terrain vehicle trail southwards to the No. 2 Zinc Vein, and walking trails to the "Rusty Bucket" gold showing, the No. 1 Zinc Vein and the Copper – Nickel showing. Access to the "North of the Old Highway" gold showing is via the former Highway approximately 900 metres before the Robb and Jamieson Township boundary.

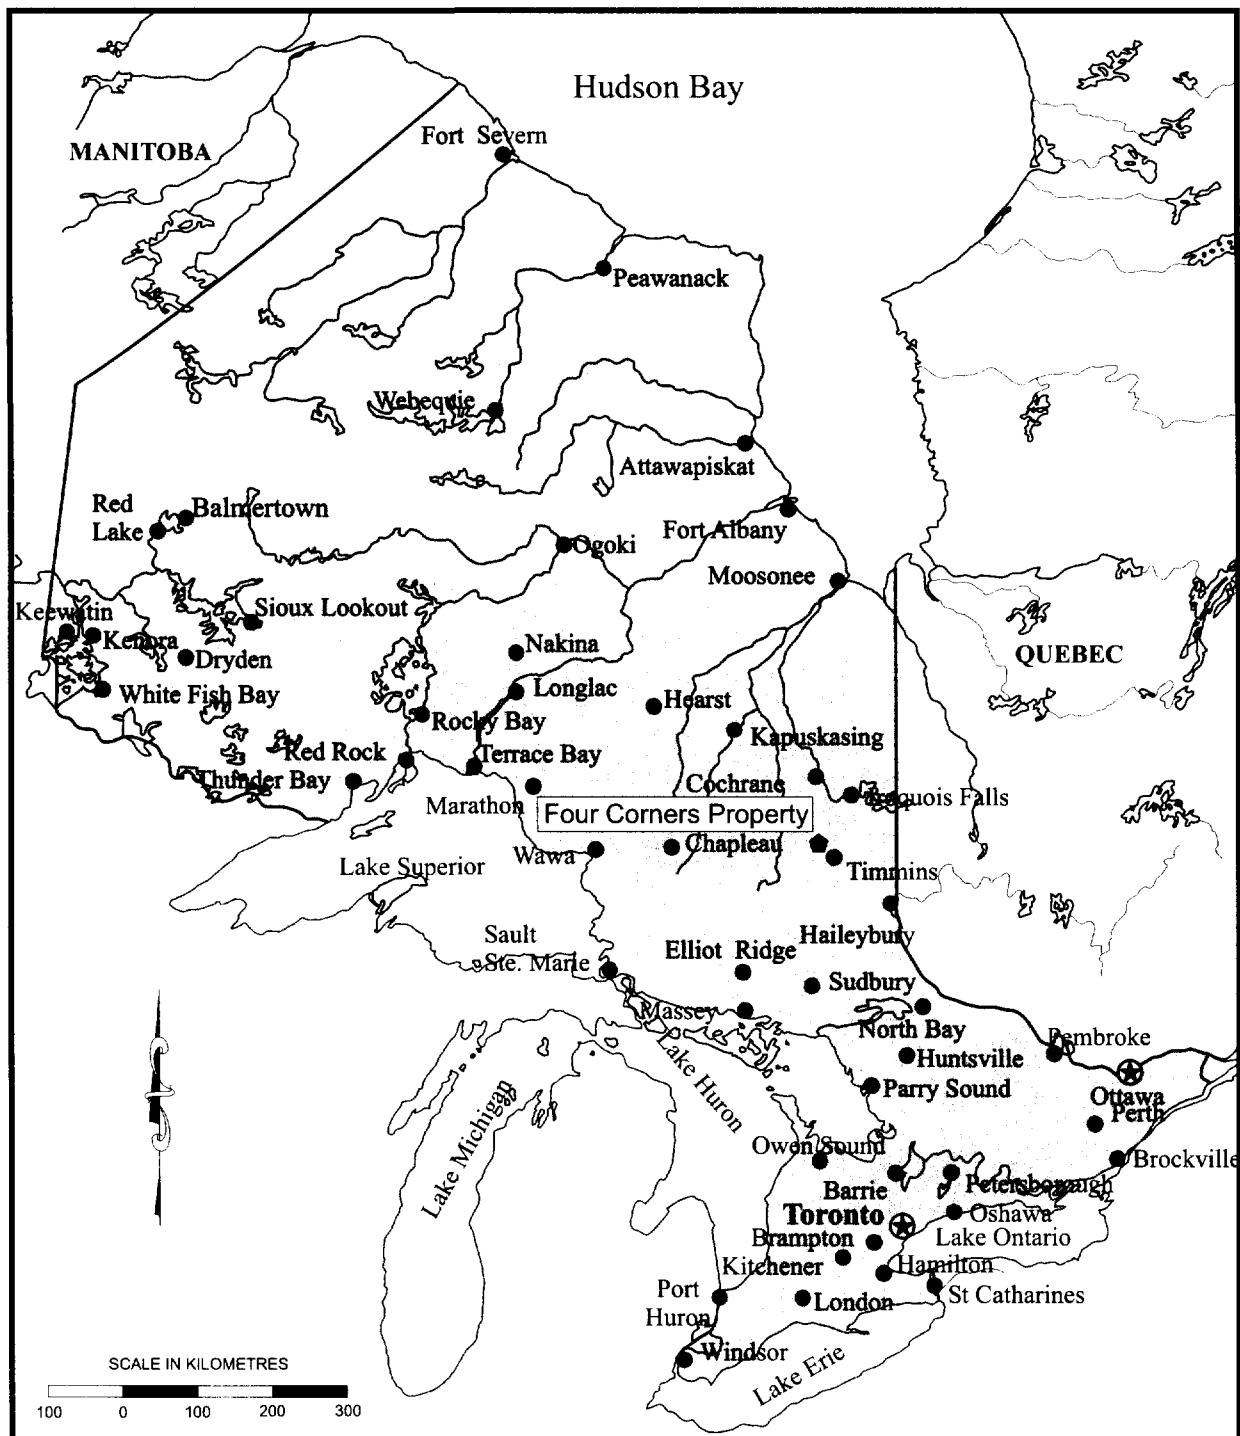

Figure 1: Location Map of the Four Corners Property with respect to Timmins, Ontario, Canada.

PROPERTY:

The property was originally staked in March, April and June, 2003. Prior to staking the property was part of the patent mining claims owned by Mr. George Jamieson, the founder of the Jameland and the Canadian Jamieson Mines.

Various individuals who own the surface rights have been contacted prior to the due diligence activities in accordance with the Mining Act of Ontario. Several of the surface rights have been offered for sale.

The property currently contains 11 staked mining claims consisting of 18 mining claim units as summarized in Table 1 and illustrated in Figure 2. The property consists of approximately 266 ha or 657 acres.

The property is owned 100% by Messier Pat Gryba and Herman Daxl.

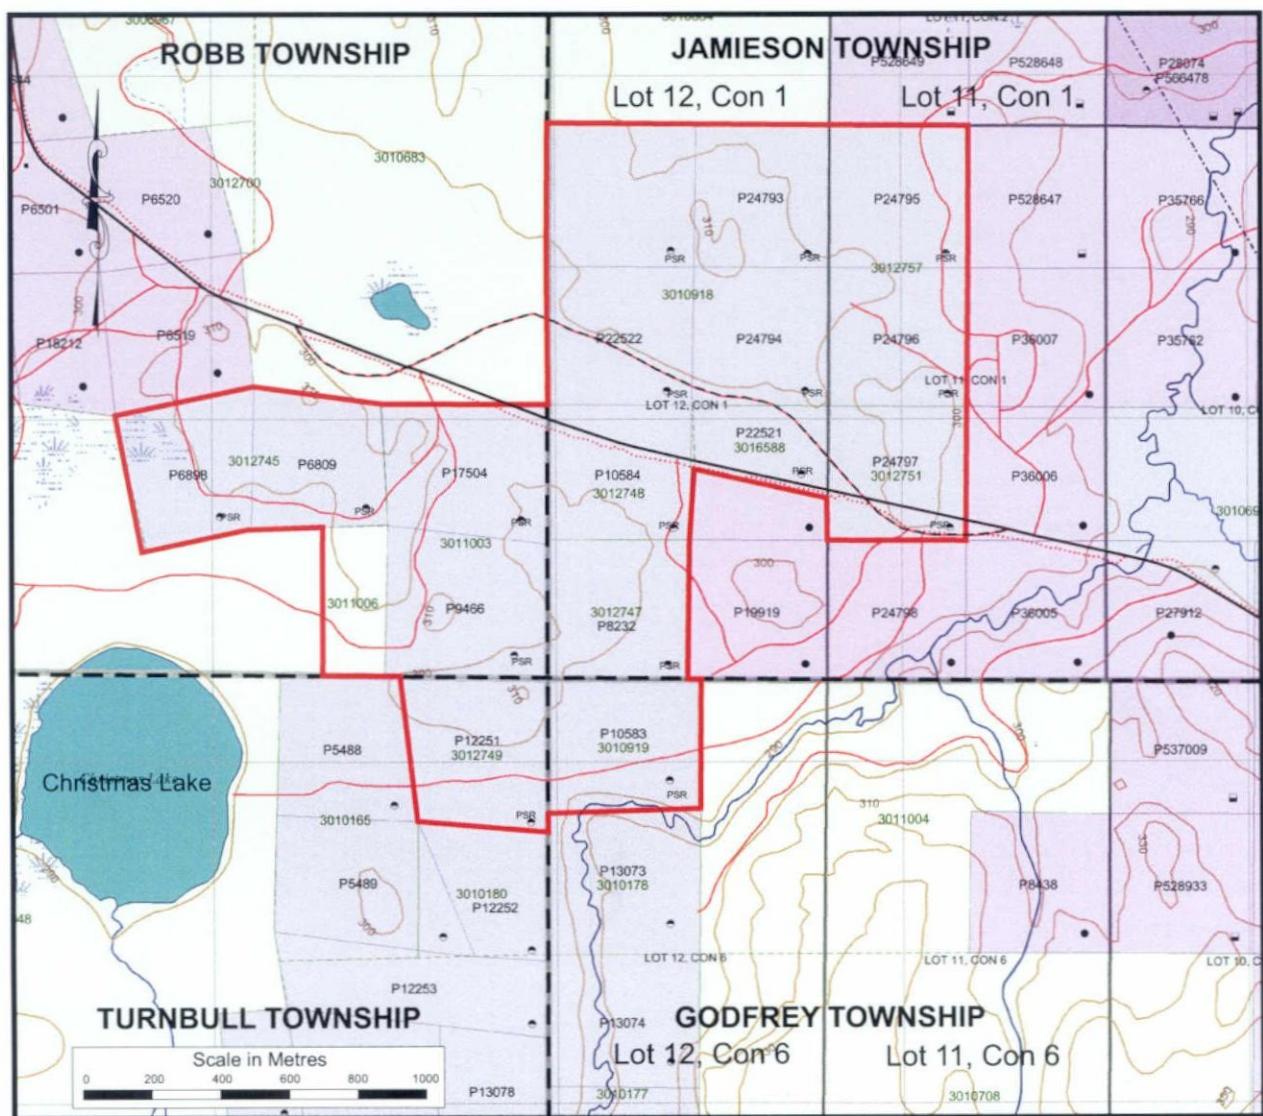

Figure 2: Mining Claim Map of the Four Corners Property in the Kamiskotia Area of Robb, Jamieson, Turnbull and Godfrey Townships, Porcupine Mining Division, District of Cochrane, Ontario, Canada.

HISTORY:

The majority of the property was staked and patented by George Jamieson in the early 1920's. Historical information regarding the current property is very limited and mainly found in ODM report by Berry (1944) and geological mapping by Nelson Hogg in 1949 (T-590, T324).

Mapping of Robb and Jamieson Townships were completed by Middleton at 1:31 680 (1973, Godfrey Township by Hogg (1954) and Turnbull and Godfrey by Middleton at 1:31 860 (1976). Ground magnetic survey compilation was completed for the four townships by Middleton (1969, 1970, 1971) and completed the report in 1973. Several authors have published information on specific topics or areas, which are of limited use regarding the current property.

Figure 3 illustrates the location of the property and the current and past producing base metal mines in the Timmins area.

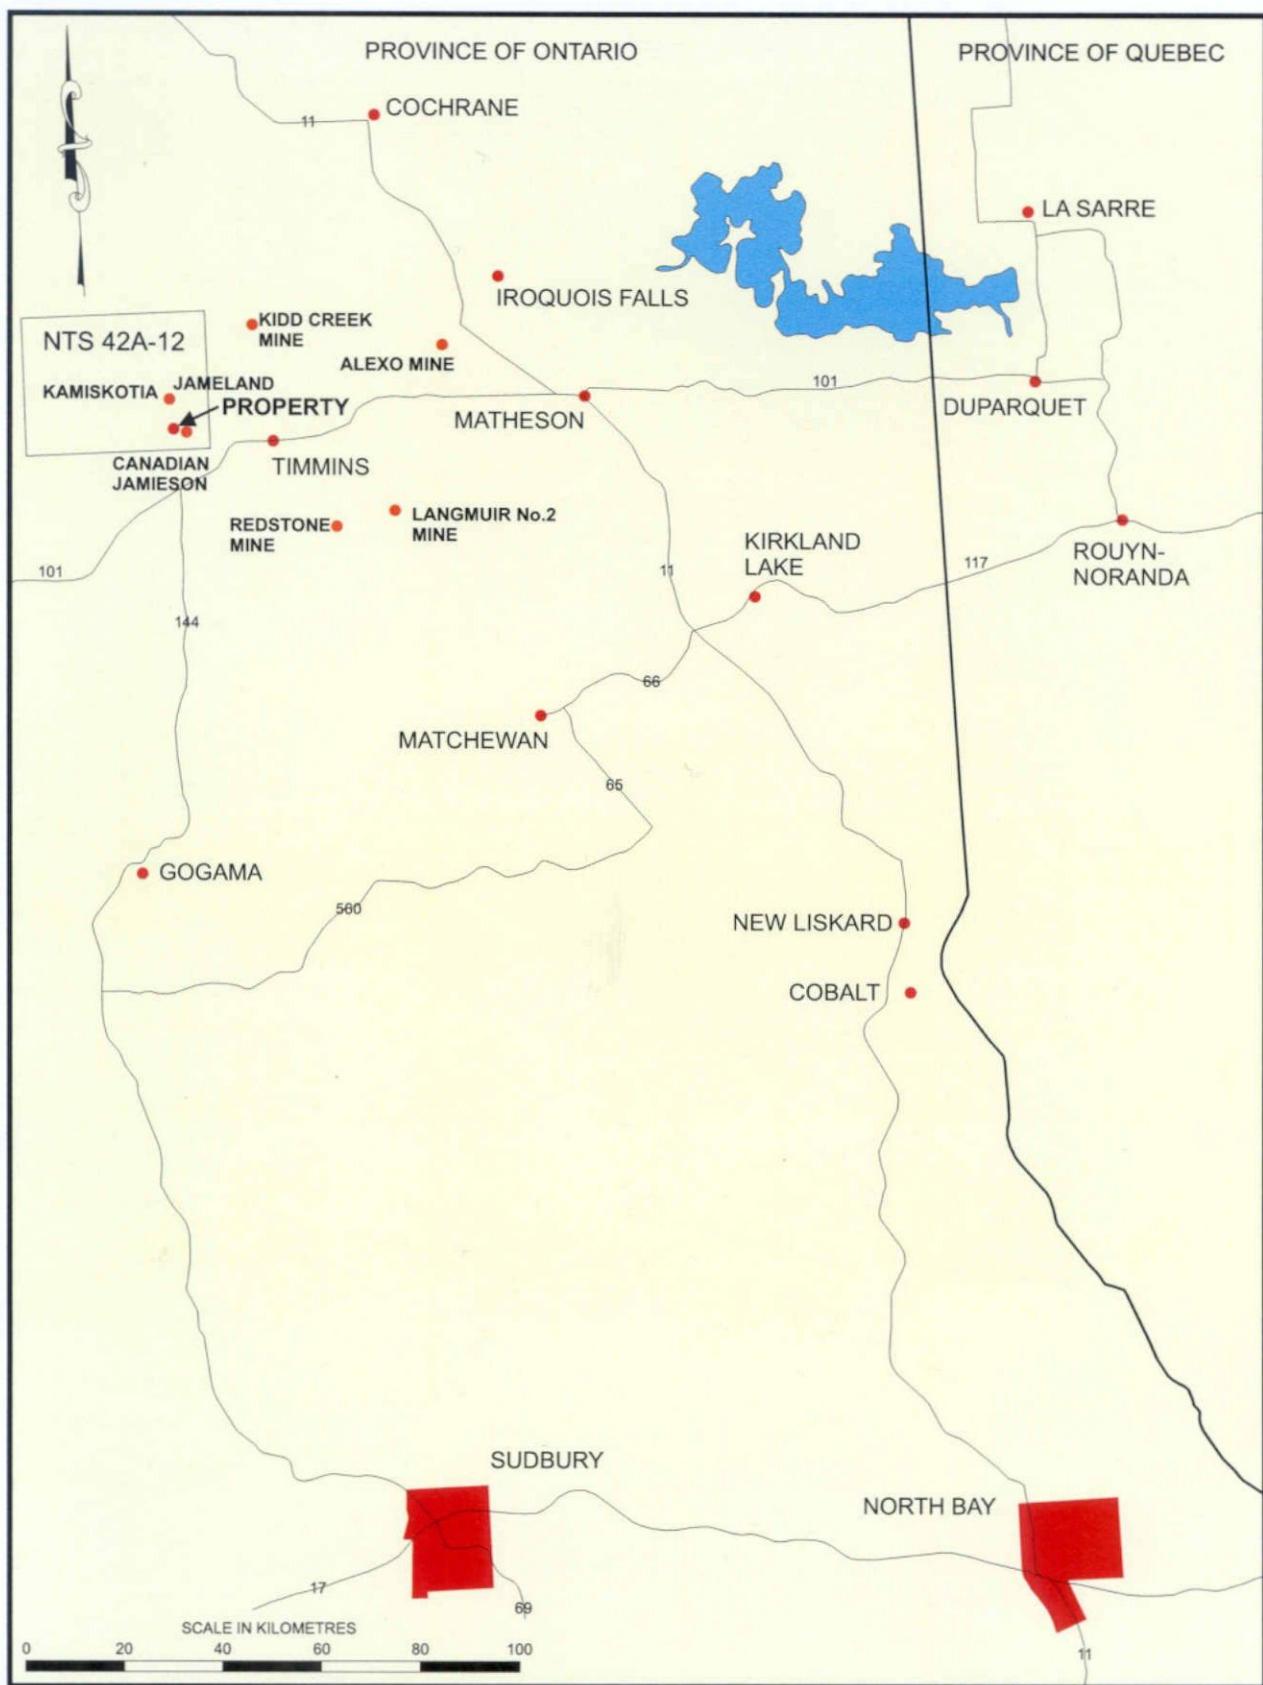

Figure 3: Property Location Map and the Current and Past Producing Base Metal Mines in the Timmins Area, Ontario.

Four massive sulphide deposits hosted in the Kamiskotia Volcanic Complex have been mined for their copper-zinc +/-gold +/-silver content, namely the Kam-Kotia Mine, Jameland Mine, Canadian Jamieson Mine and the Genex Mine.

The Kam-Kotia Mine produced 186,000 tones or 169,000 tonne during the Second World War. During 1961 to 1972 produced 6,436,000 tons or 5,840,000 tonne (this figure includes a minor production amount of ore from the Jameland Mine) with an average grade of 1.1% copper, 1.2% zinc, 0.1 ounce per ton silver and also 5,604 ounces of gold.

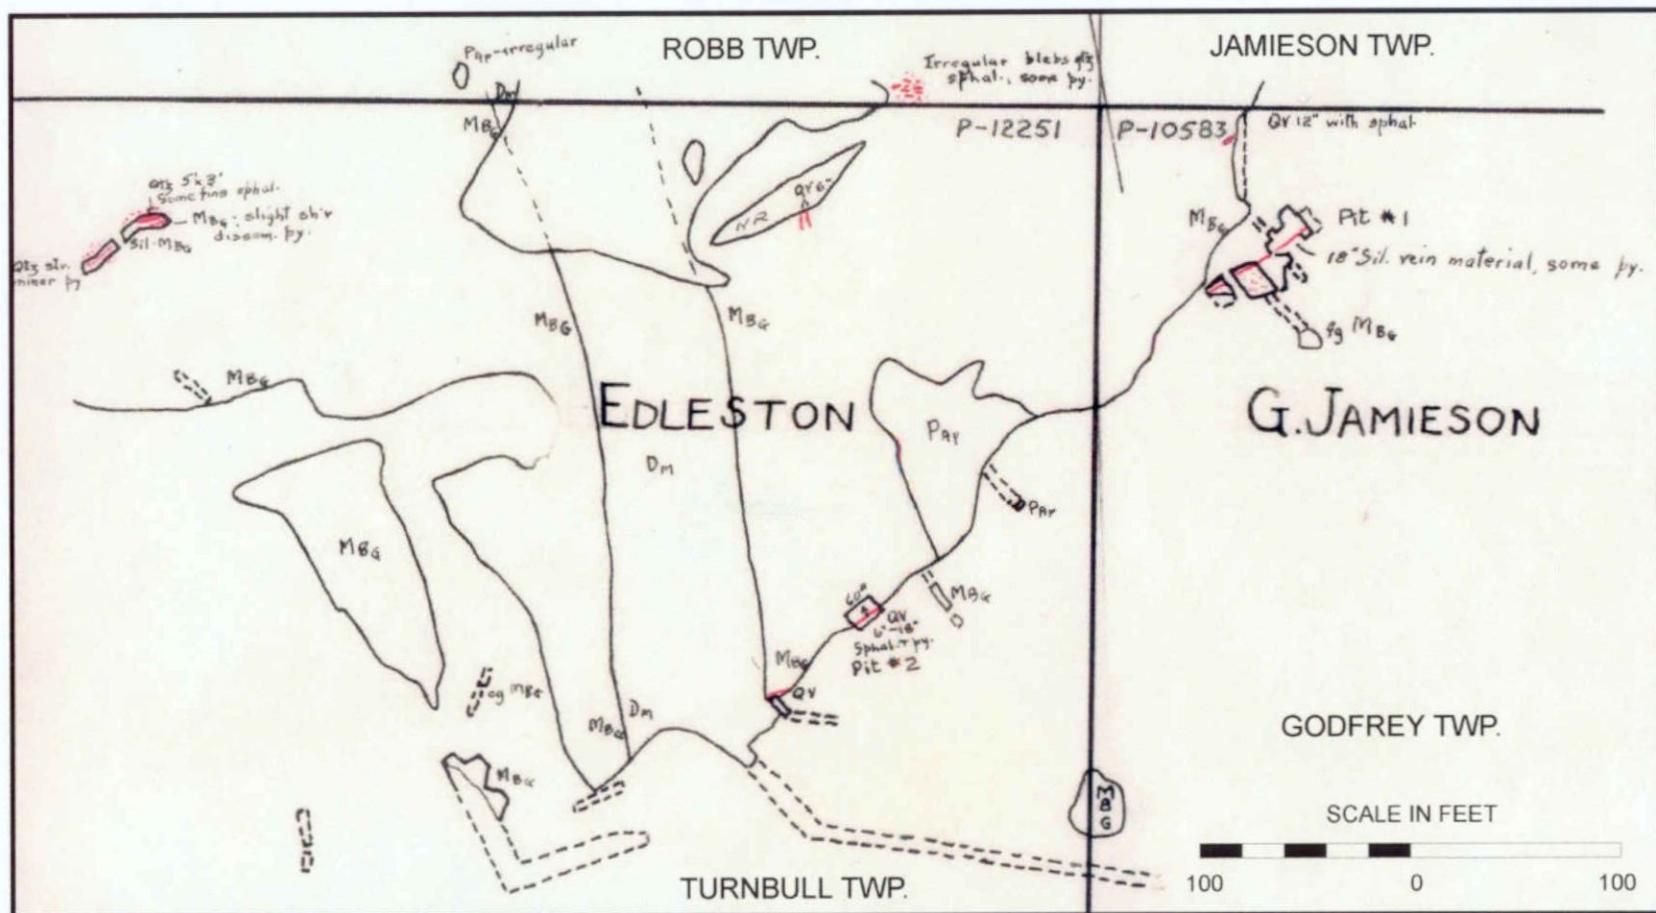

The Canadian Jamieson Mine operated from 1966 to 1971 producing 816,000 tons or 740,000 tonne of ore averaging 2.4% copper and 4.2% zinc.

The Genex Mine production was minor with approximately 120,000 tons or 109,000 tonne of ore averaging 2.2% copper.

The author has included the detail maps of Nelson Hogg regarding various portions of the property. Figure 4 illustrates the southern portion of Zinc Vein No.1. The quartz vein varies from 6 to 18 inches wide and contains disseminated sphalerite adjacent to a seam of massive sphalerite.

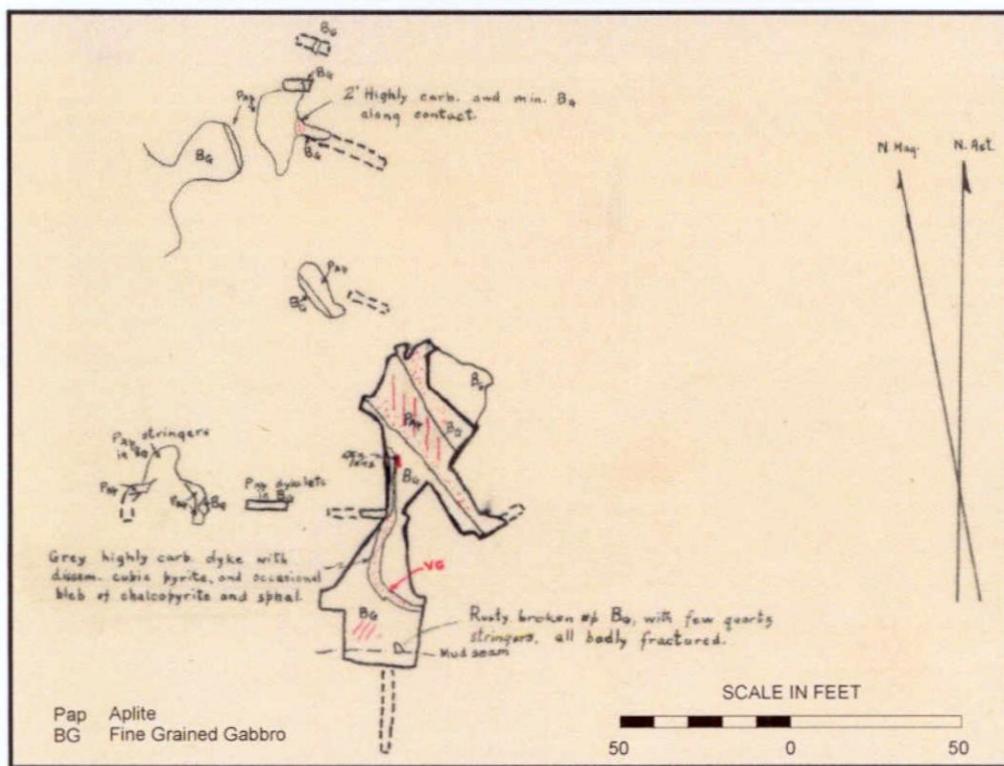

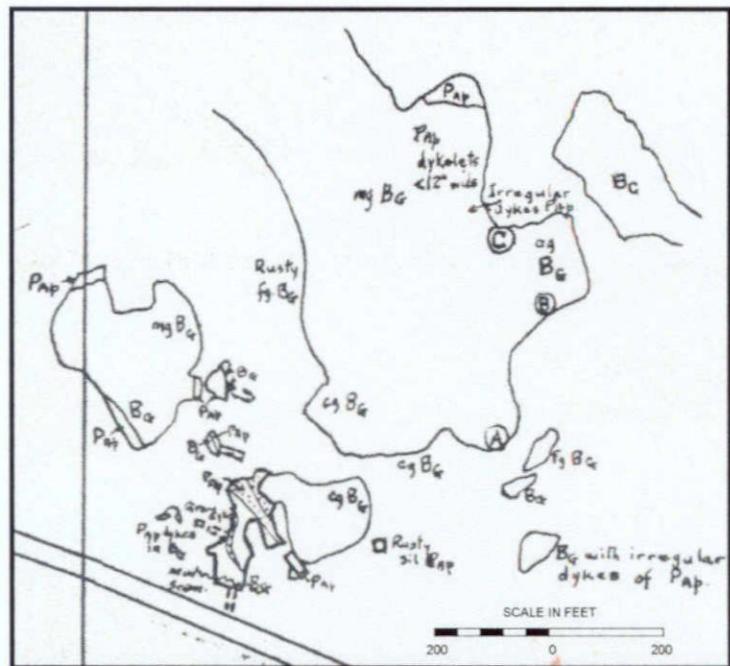

Figure 5a (top map) illustrates the general geology of Jamieson's Gold Showing, which is located north of the former position of Highway 576 and Figure 5b (bottom map) illustrates a detail plan map of the trenched area. The northerly trending quartz stringers located on the north side of the water filled pit was noted by Nelson Hogg to contain chalcopyrite, sphalerite and visible gold.

Due to the location of the Gold showing, Hogg convinced the provincial government to relocate Highway 576 in 1955 to its current position.

Nelson Hogg's sketch map of G.Jamieson's Zinc Showing and New Digby Dome Property, August 16, 1949(Assessment File T-590).

Figure 4: Southern extension of Zinc Vein No.1 in Godfrey and Turnbull Township.

Nelson Hogg's detail sketch map of G.Jamieson's Gold Showing, North of Original Highway 576, August 3, 1949(Assessment File T-324).

Figure 5a (top) General Geology of Jamieson's Gold Showing.
 Figure 5b (bottom) is a detail plan map of the Trenched Area.

GENERAL GEOLOGY:

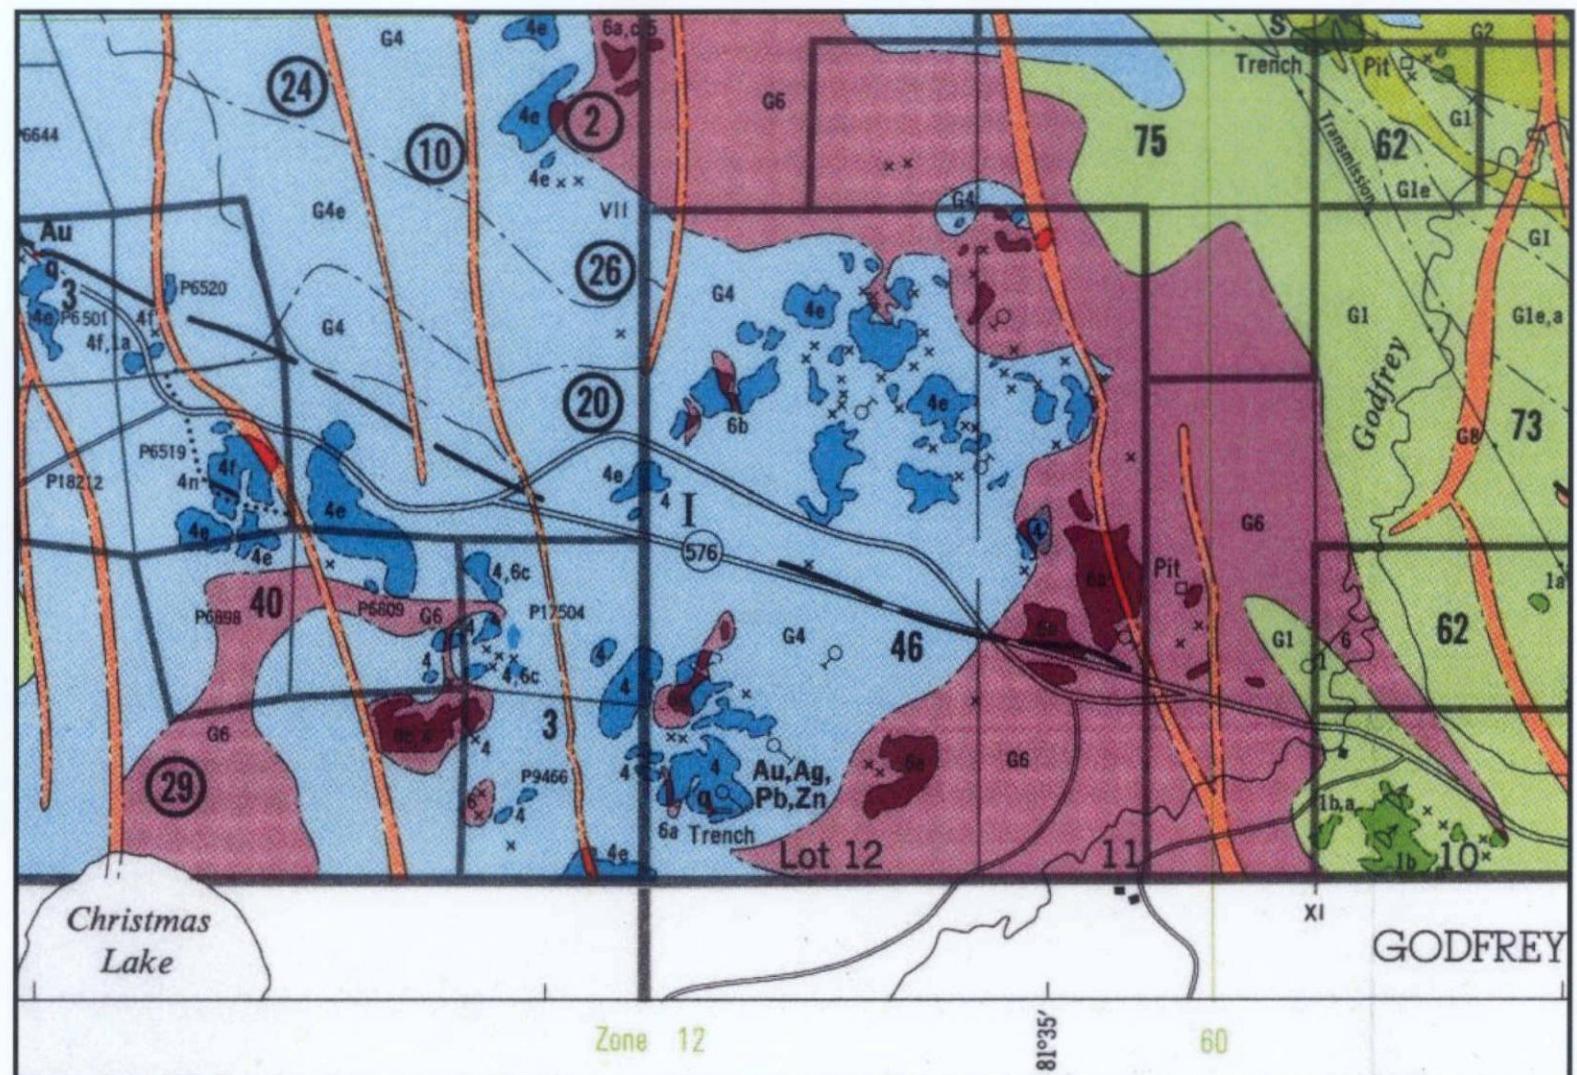

The author has included a portion of Middleton's geological map of Robb and Jamieson Townships (1973, Map 2255) as a reference to the area geology. The more recent OGS publication on the General Geology of the Kamiskotia Area is too generalized without indicating the outcrop coverage and the location of the Canadian Jamieson Mine is located on the wrong side of the Highway 576.

The Kamiskotia Gabbroic Complex (KGC) is a large deformed tholeiitic intrusive complex situated centrally in the Kamiskotia area. It is overlain by and in part gradational with metavolcanic rocks of the Kamiskotia Volcanic Complex (KVC) which includes basalt and rhyolite. Granitoid masses composed of hornblende +/- biotite tonalite to granite have intruded the stratigraphy.

The property has a large sill like gabbroic body intruded by several felsic porphyry dikes and a north-northwest trending diabase dike. Two notable porphyries in Jamieson Township contain gold mineralization which are the "North of Old Highway" gold showing and the "Rusty Bucket" gold showing hosted in a carbonated and quartz veined aplite to feldspar to quartz feldspar porphyry.

In the central portion of the property, near the junction of Jamieson, Turnbull and Godfrey Townships are 2 sub-parallel shear zones trending in a northeasterly direction. These shear zones host the Zinc No.1 and Zinc No.2 zones.

In the western portion of the property in Robb Township is a newly discovered copper-nickel mineralization hosted in the gabbroic body or dunite.

PROPERTY EXAMINATION:

Pat Gryba conducted the initial property inspection with Kian Jensen on May 6, 2004. Although there was still snow on the ground, enough bedrock was exposed at the mineralized locations.

Phase 1 – Initial Grab Sampling:

The due diligence property examination included prospecting and sampling by Kevin Keith and Dion Wade from May 14, 2004 to June 10, 2004, detail mapping and supervision of the chip and channel sampling by Kian A. Jensen, P.Geo. May 23, 2004 to June 9, 2004.

Table summarizes the initial grab samples from the “Rusty Bucket” gold zone and the copper-nickel showing, chip samples from Zinc Vein No.1 and No.2, and grab samples from several old trenches and mineralized outcrops throughout the property.

The highest seven gold values were obtain from the North of Old Highway showing ranging from 0.134 opt to 4.215 opt gold. These are followed by 0.121 opt gold from Zinc Vein No.1 and 0.104 opt gold from the Rusty Bucket gold showing.

The silver values ranged from 12 g/t up to 29 g/t silver from both the Zinc Vein No. 1 and Zinc Vein No.2 showings and a high of 12 g/t from the North of Old Highway gold showing.

The copper – nickel showing returned values ranging from 2835 ppm to 0.645% copper, 1523 ppm to 4448 ppm nickel and 115 to 332 ppm cobalt with elevated values from 3945 ppm to 8729 ppm titanium and 40 ppm to 73 ppm vanadium.

initially
The highest value of zinc was obtained from Zinc Vein No.2 with a value of 8.44% zinc and several values from 1.897% to 1.95% zinc. Zinc Vein No.1 due to the excellent exposure returned 5 of the highest values ranging from 1.814% zinc to 7.447% zinc, then < 36% Zn, 4.24 g/t Au, 50 g/t Ag, over 40 cm (page 32).

An angular siliceous porphyry float located near the porphyry - gabbro contact north of the Copper-Nickel showing returned a value of 0.473% copper, 0.094 ppm gold, 7 ppm silver, 19 ppm cobalt, 48 ppm nickel, 21 ppm lead, and 435 ppm zinc.

Phase 2 – Geophysical Surveying:

Richard Daigle of Geoserve Canada Inc. completed approximately 8.9 km of line cutting and an Induced Polarization (IP) surveying with an a spacing of 25 metres reading N=1 to N=6. Grid lines 800 North and 1000 North were also surveyed with Total Field Magnetic survey and Horizontal Loop Electromagnetic (HLEM) survey method with a coil separation of 150 metres. The grid and surveying commenced on May 23, 2004 and completed by June 15, 2004.

Figure 7 illustrates the cut grid, IP anomalies, the initial grab sample locations, generalized geology, outcrop coverage and the locations of the mineralized Zones.

IP anomaly K401 (high chargeability and low resistivity increasing at depth) may be related to either an overburden condition as it is at the edge of the swamp and outcrop or probably contact sulphide mineralization. It should be noted that in this area there are several small quartz veins with sphalerite mineralization and the K401 anomaly requires additional exploration activities.

It appears that the IP anomalies K402 (high chargeability and very high resistivity), K403 (moderate chargeability and weak resistivity) and K407 (weak chargeability and near surface low resistivity) are probably associated with the edge effects of the north-northwest trending diabase dikes. The IP grid line 800N did not detect the southern extension of Zinc Vein No.1 as the grid line was following the axis of the diabase dike.

IP anomaly K404 (weak chargeability and very low resistivity) and may be related to a contact located at or very near to the property boundary.

IP anomaly K405 (moderate chargeability and at the flank of a very high resistivity contact), K406 (moderate chargeability and moderately deep low resistivity) and K408

(weak chargeability and high resistivity) are located in the swamp areas and may be related to sulphide mineralization at or near the contact of the gabbro and felsic intrusive to the southwest of the copper-nickel showing.

The IP survey on Line 1450E at approximately 1050N was just east of the Cu-Ni mineralization and indicated very weak chargeability response with an increasing resistivity response at depth.

IP anomaly K409 (two weak chargeability and a broad resistivity anomaly) is located on the northwest and southeast side of the North of Old Highway gold showing. The survey line was at or very near to the contact of the gabbro (southwest) and the quartz feldspar porphyry (northeast). The western anomaly is near surface and may be related to sulphide enrichment in the gabbro. The North of Old Highway gold showing is probably related to the moderate resistivity and contact mineralization between 1800E and 1900E and probably plunges in a southeasterly direction at depth..

IP anomalies K410 (moderate chargeability and high resistivity both near surface) is located just west of the southern portion of Zinc Vein No.1 and may have either located a parallel to sub parallel structure similar to the vein or are a result of the side seeking effect of the IP survey. K411 (high chargeability at moderate depth and high resistivity near surface) may be related to Zinc Vein No.1 or a parallel structure to the shear zone and vein. K412 (moderate chargeability and high resistivity both near surface) and appears to be related to the overburden and outcrop affect. The IP survey on Line 2000E between K410 and K411 indicates that the tongue of the felsic intrusive to the east may extend further westerly than previous known.

IP anomalies K413 (weak chargeability with no resistivity effect) appears to be structurally south of the northerly trending quartz vein that is exposed on the north side of the water filled pit in the North of Old Highway gold showing. This anomaly may be

related to this vein structure and since the vein and associated sulphide mineralization is approximately 4 feet wide may not be detected with an IP spacing of 25 metres.

IP anomalies K414 (high chargeability and high resistivity) is located at the end of Line 2000E in an area of small outcrops and may be related to a felsic intrusive or siliceous zone. Previous mapping indicates that gabbroic rocks underlie the area. This particular anomaly requires additional exploration activities.

At or near the junction of Line 2000E and Line 1000N, the area is underlain by a very high resistivity with no chargeability anomaly and may indicate a large felsic intrusive body.

See also IP Addition Daxl - Exsics in Attachments with IP sections.

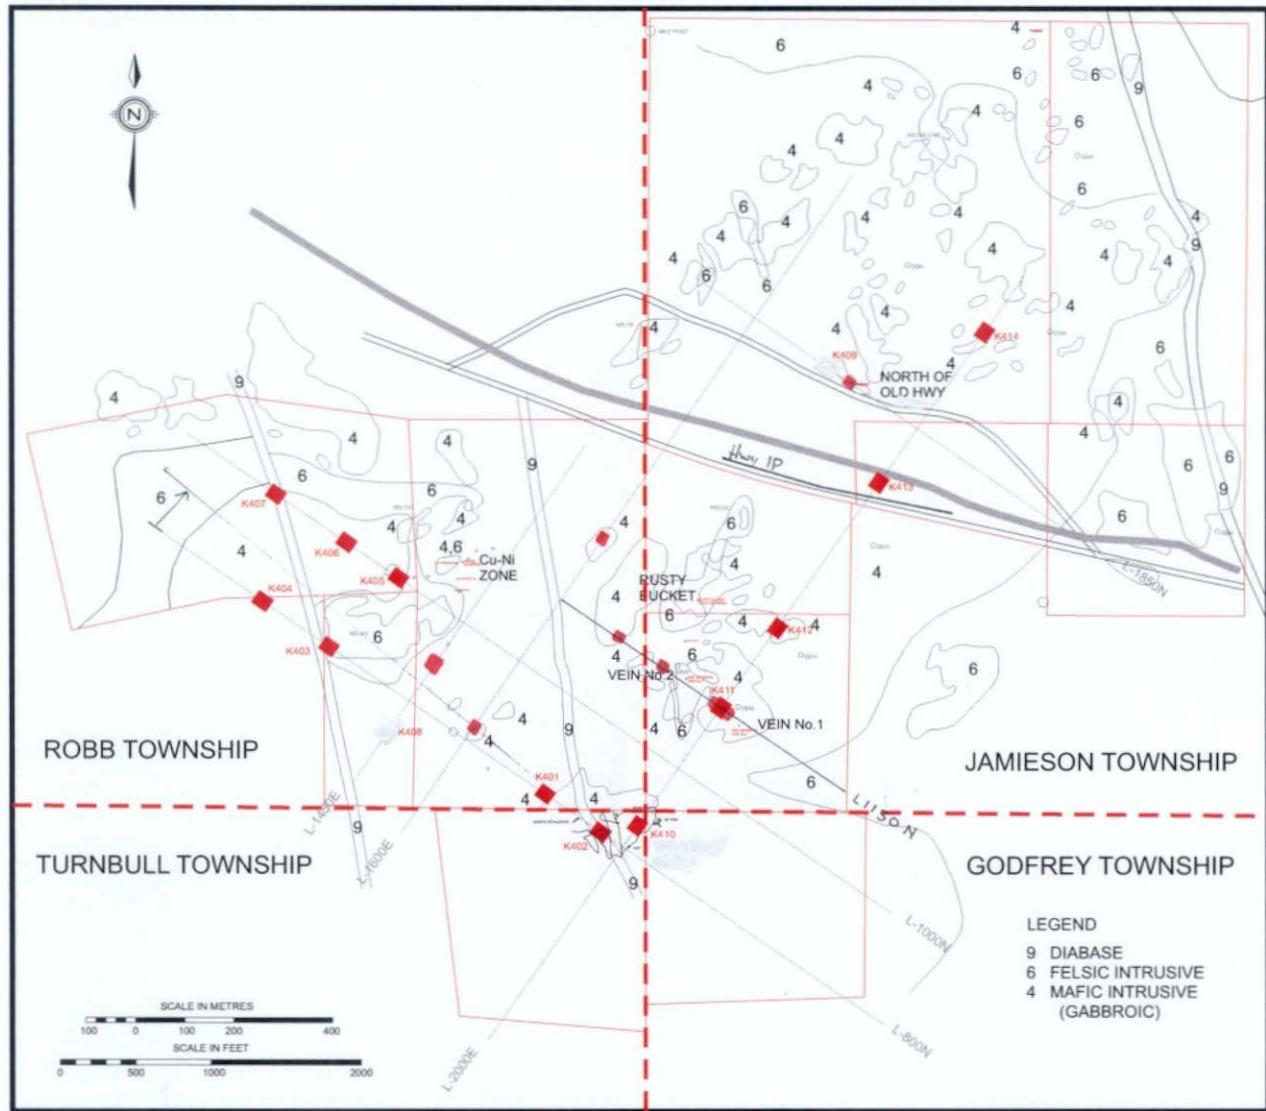

Figure 7: Compilation Map Illustrating the 2004 IP Grid and Anomalies, Initial Grab Sampling Locations and Mineralized Zones.

Phase 3 – Detail Geological Mapping and Channel Sampling:

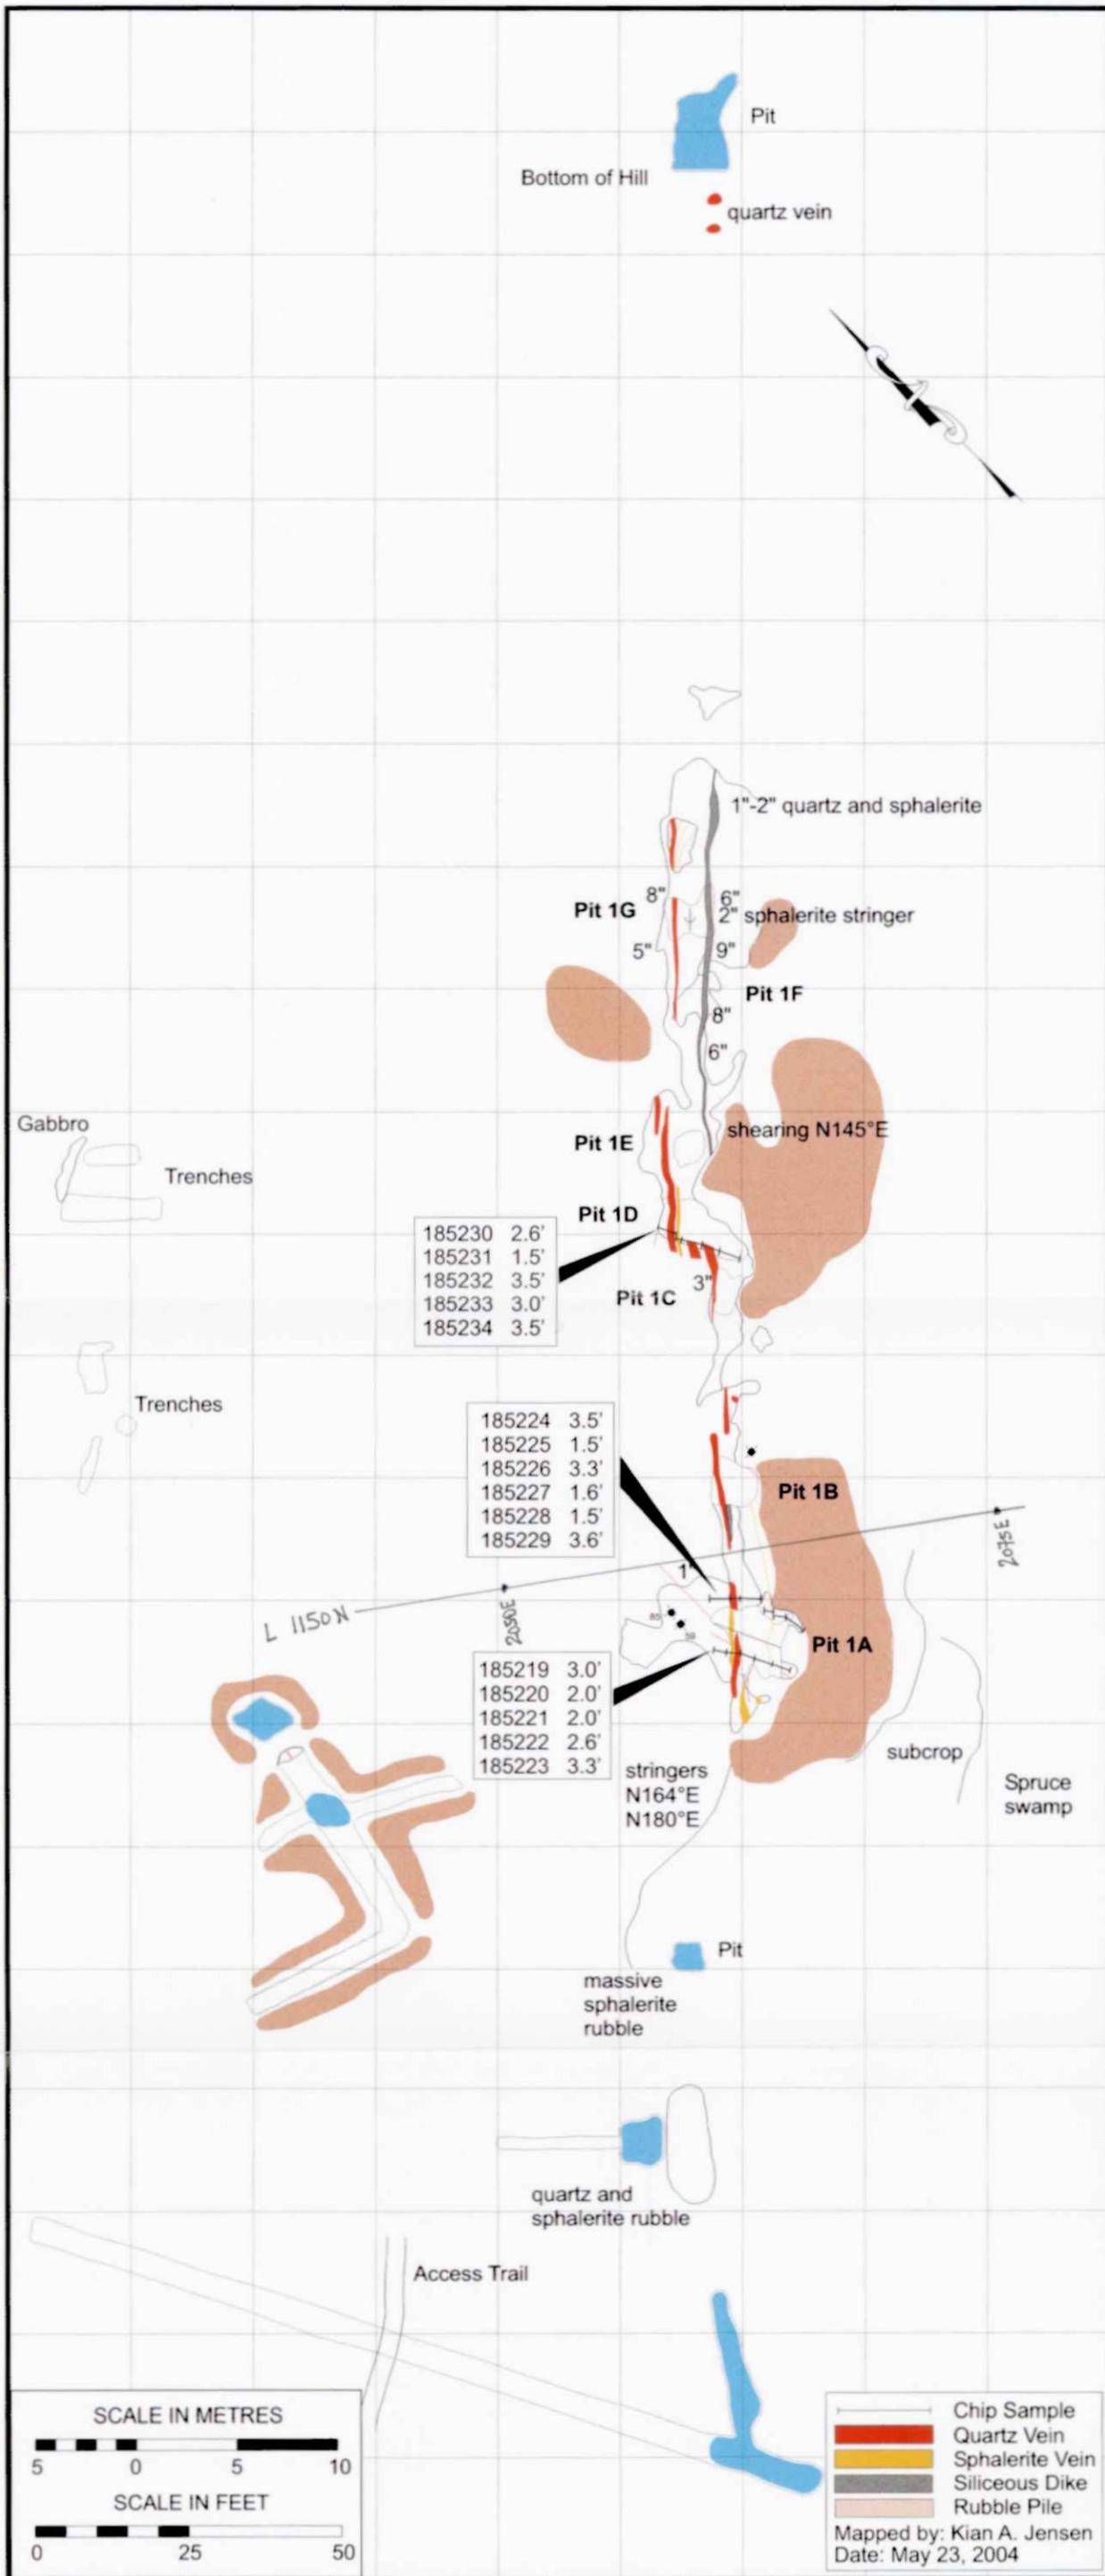

The author conducted detail mapping of 4 areas: Zinc Vein No. 1, Zinc Vein No.2, the Rusty Bucket Gold Zone, and North of the Old Highway Gold Zone.

Figure 8 is the sketch map of Zinc Vein No. 1 showing the location of the original chip sampling. This area has a higher gold ratio to silver. It has been reported that high tungsten values are obtained from the quartz veining associated with the shear zone. Sampling conducted by a previous company has been report to return values averaging 25% Zn, 7 g/t Ag, approx. 0.5% Cu and 1% W. Vein No. 1 has scattered patches of malachite straining and may have been mobilized by ground water and precipitated out. This may indicate the presence of copper mineralization and associated higher gold values at depth.

Figure 9 is the sketch map of Zinc Vein No. 2 showing the location of the channel sampling and the grab samples of the higher-grade material. This area has been reported to have higher silver ratio to gold. Berry reports that this area has yielded silver values up to 32.7 opt silver. This vein in the vicinity of the felsic dike has been report to contain up to 14.44% lead associated with the high silver values. Native silver has been reported in this area, but the author has not been able to verify this information with new sampling, mainly due to overburden coverage.

Figure 10 illustrates the initial grab sampling of the “Rusty Bucket” gold zone. This area has been reported to return higher gold values up to 1.29 opt gold, but the sampling has not detected areas of higher values.

Figure 8: Zinc Vein No.1 General Geology and the Initial Chip Sampling Location. Scale: Each Square is 20 feet.

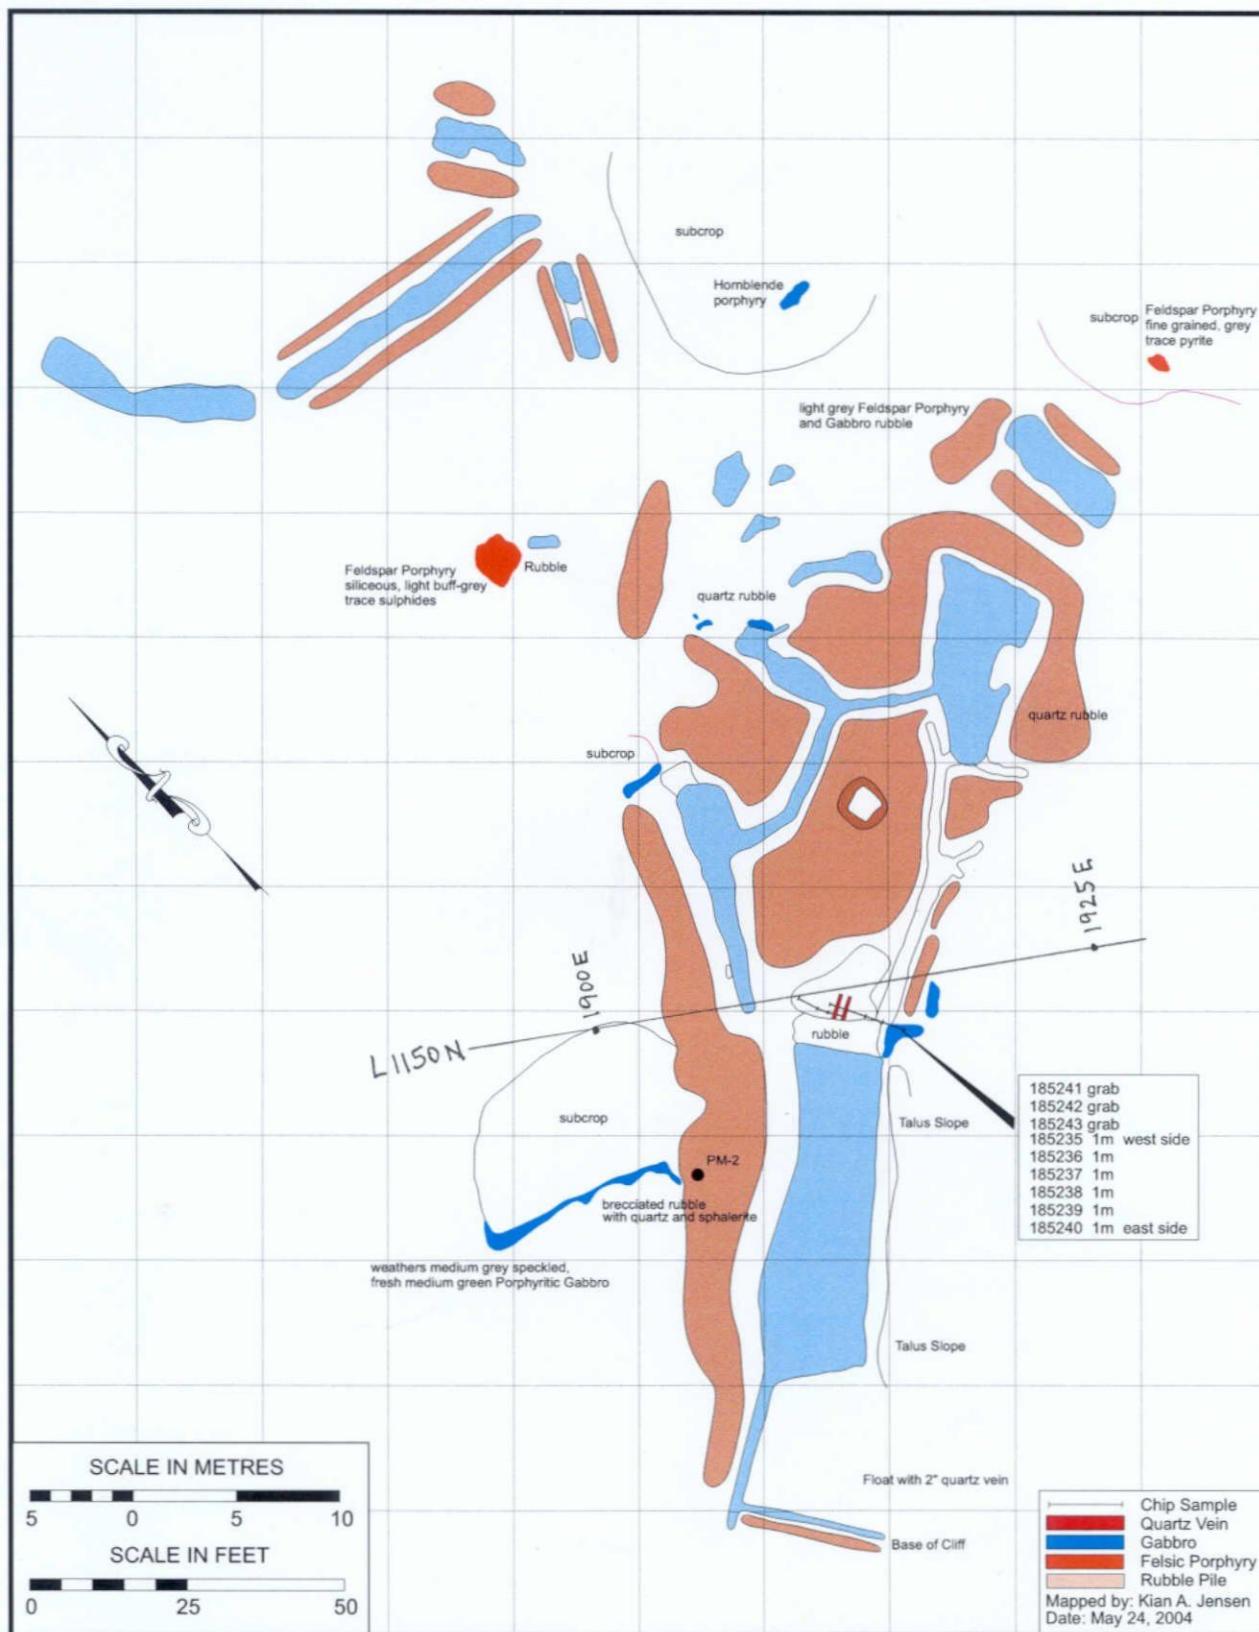

Figure 9: Zinc Vein No.2 General Geology and the Initial Chip Sampling Location.
Scale: Each Square is 20 Feet.

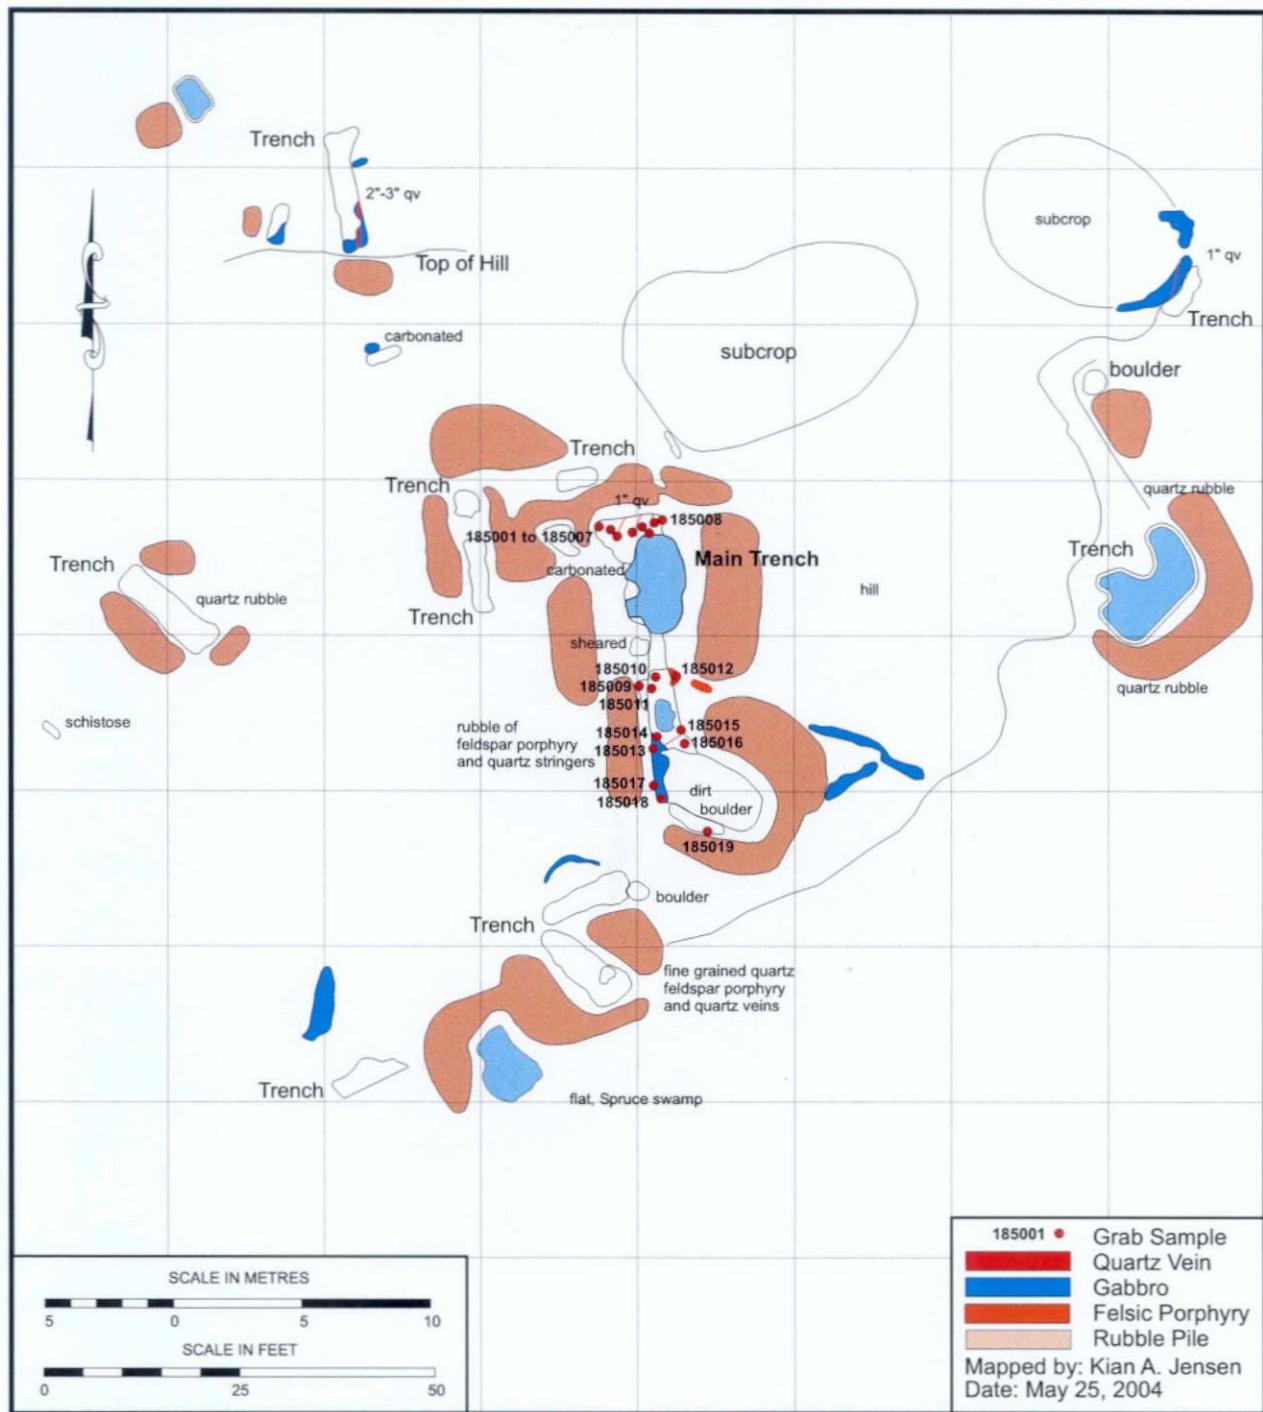

Figure 10: Initial Grab Samples and General geology of the Rusty Bucket Gold Zone.

Figure 11 illustrates the sketch map of the “North of Old Highway” gold showing area and the location of the initial grab sampling.

Table 2: Gold assays from the Initial grab Samples from North of the Old Highway Gold Showing area.

Client Sample	Type	Au (ppb)	Au (oz/t)	Au (ppm)
185268	grab	12	<0.001	0.012
		13		
185269	grab	54854	1.600	54.854
185270	grab	2305	0.067	2.305
185271	grab	1514	0.044	1.514
185272	grab	9463	0.276	9.463
185273	grab	8496	0.248	8.496
185274	grab	9249	0.270	9.249
185275	grab	144509	4.215	144.509
185276	grab	4578	0.134	4.578
185277	grab	1606	0.047	1.606
		1440	0.042	1.44

After receiving the assay results from the grab samples, it was determined to conduct a more detail sampling of 2 areas, being the North of the Old Highway gold zone and the Zinc Vein No. 1 areas.

Table 3 summarizes the assay results of the channel samples for the “North of the Old Highway” gold showing. The author has not received the re-assaying of sample number 185334. Figure 12 illustrates the location of the initial grab samples and the follow-up channel samples of the North of the Old Highway gold showing.

Table 4 summarizes the assay results of the channel samples for the Zinc Vein No. 1. Figure 12 illustrates the location of the initial chip samples and the follow-up channel samples.

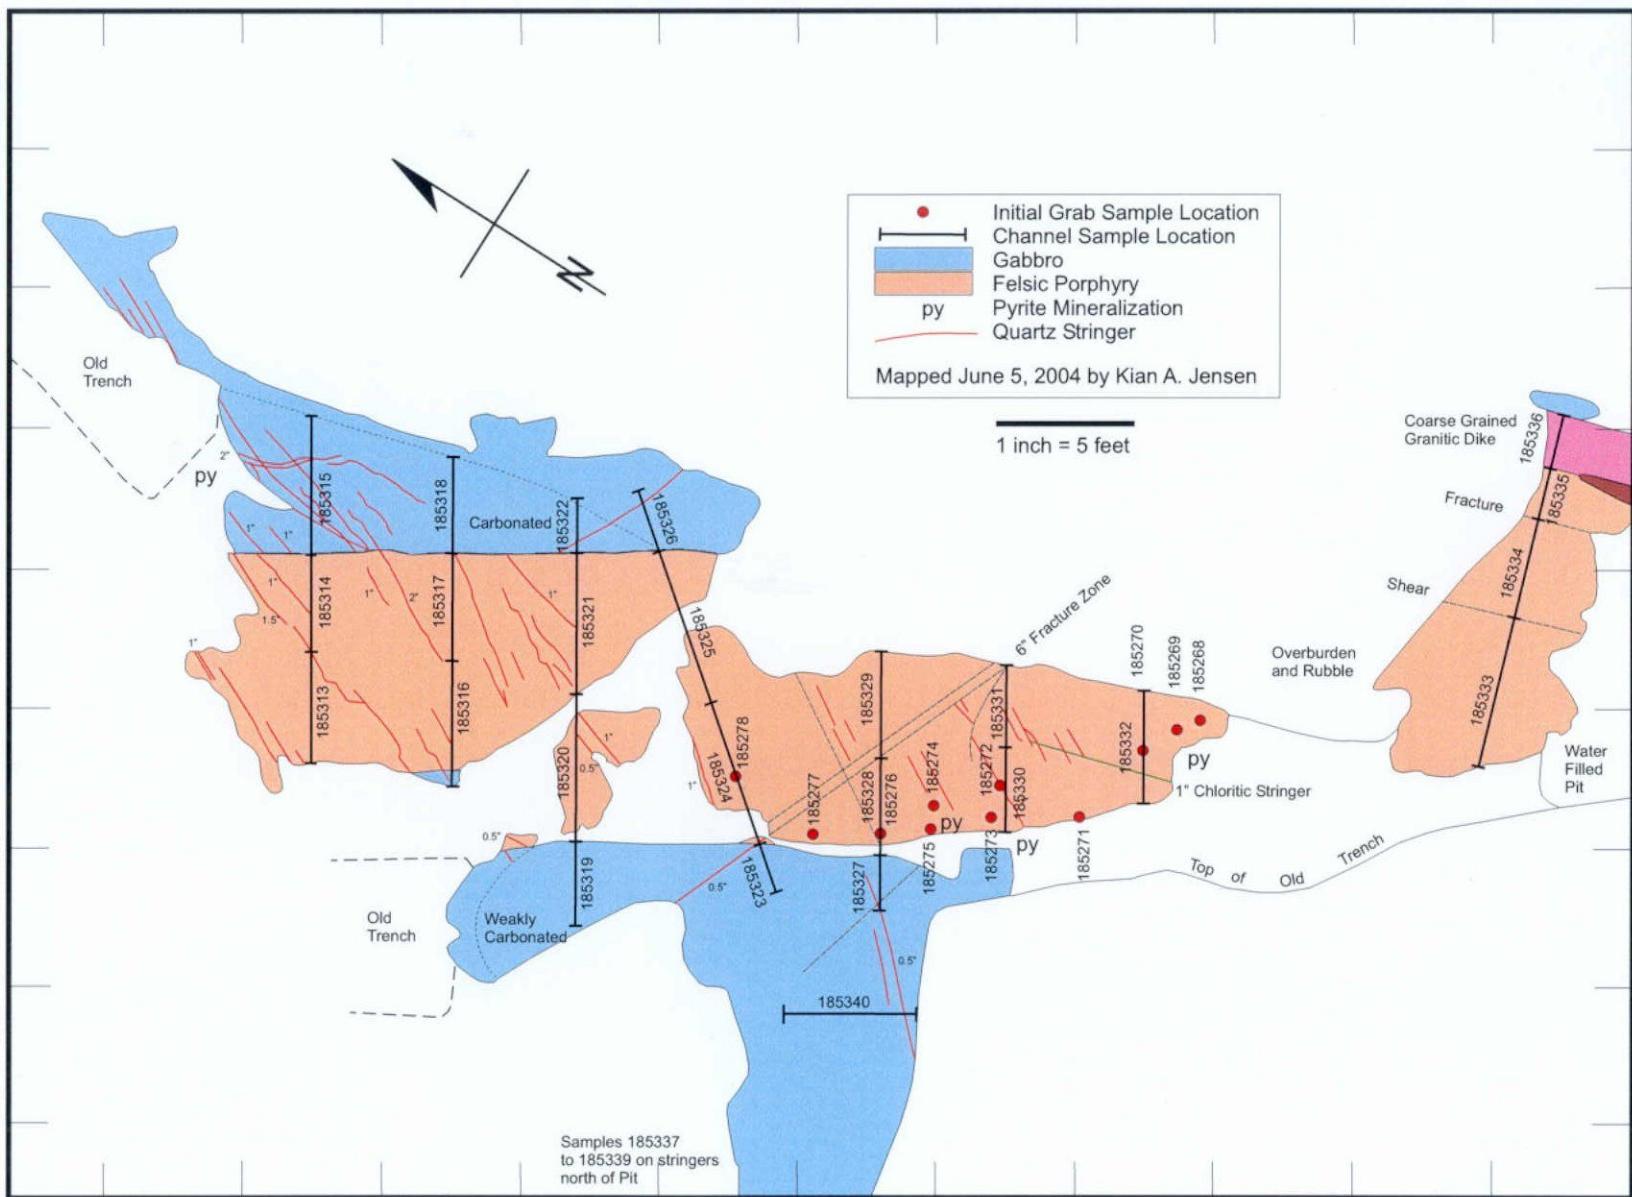

Figure 12: Initial Grab Sample and Channel Sample Locations for the North of the Old Highway Gold Showing

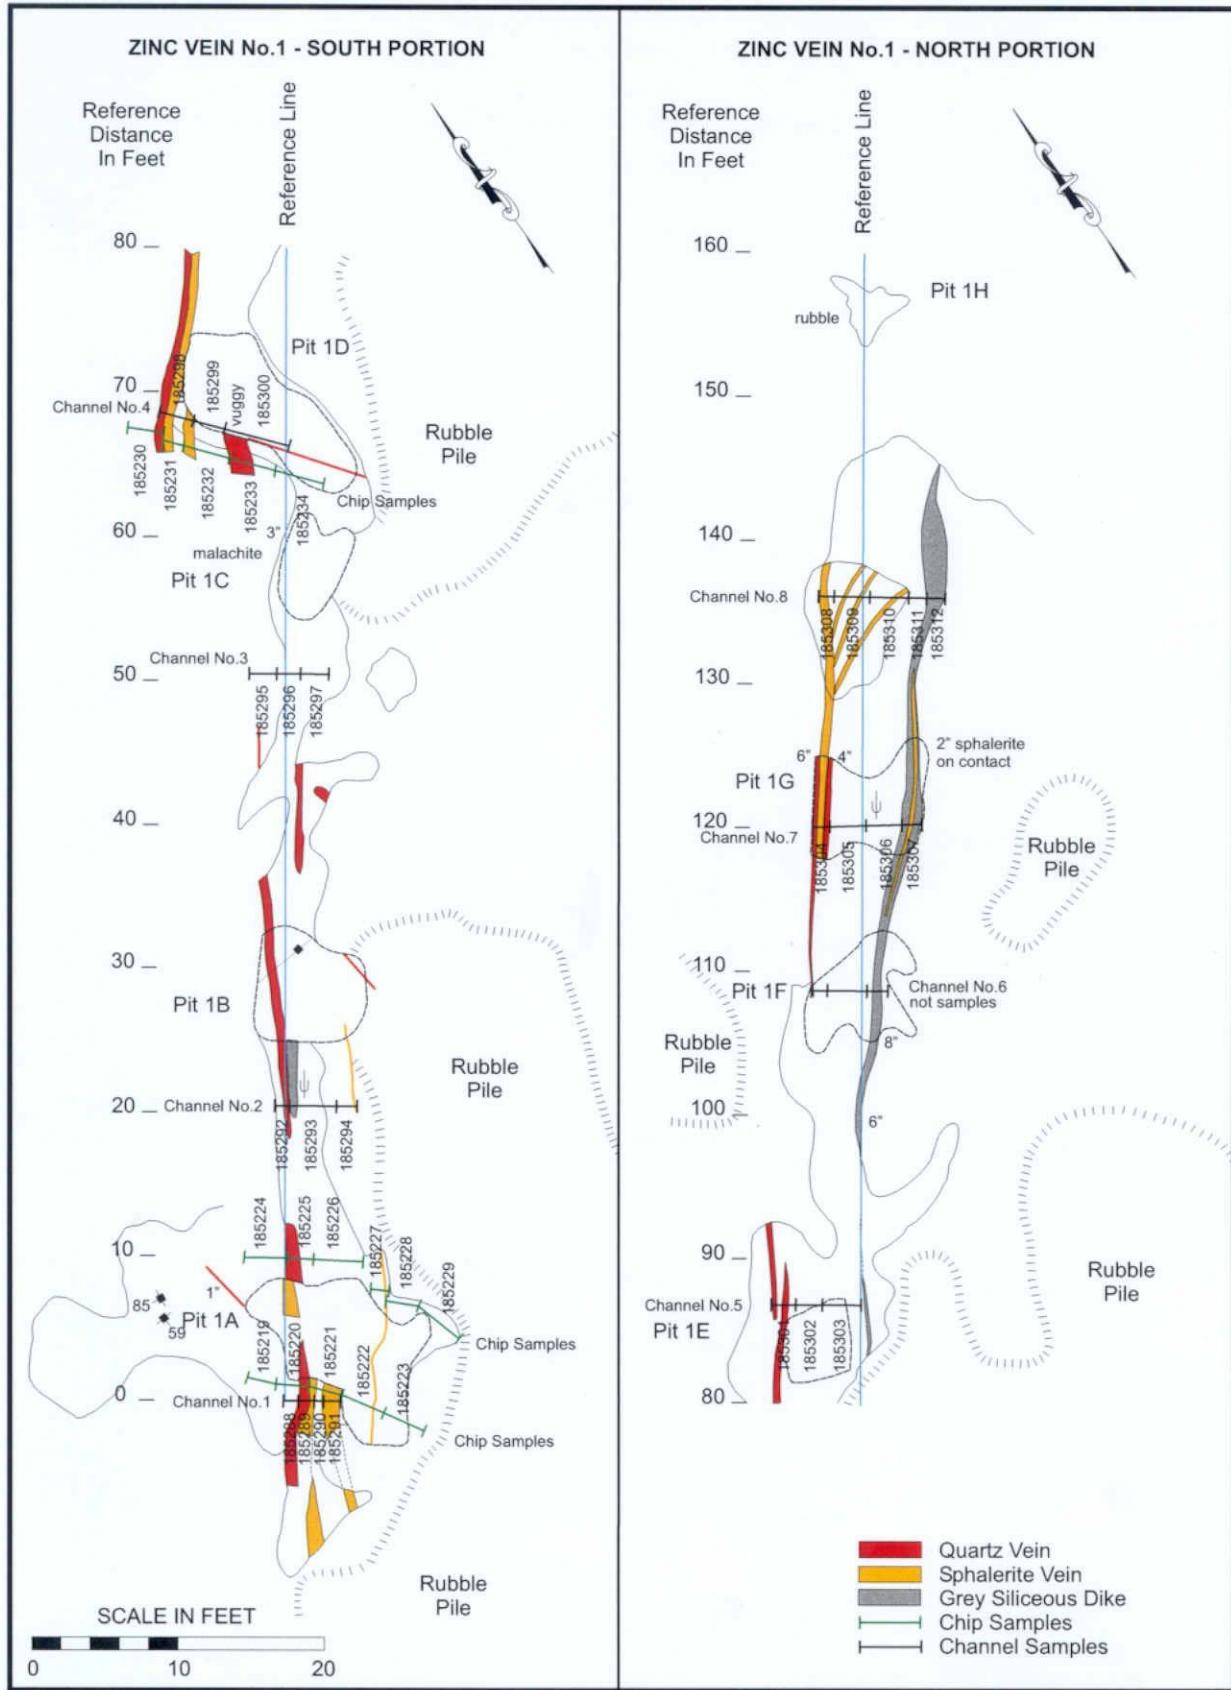

Figure 13: Location of the Initial Chip Samples and Channel Samples for Zinc Vein No.1.

DISCUSSION OF ASSAY RESULTS: (Certificates in attachments)**RUSTY BUCKET GOLD SHOWING:**

The area locally known as the "Rusty Bucket" gold zone yield low values of gold ranging from below detection limit to as high as 0.104 opt or 3.582 g/t gold in a felsic intrusive with approximately 1% fine pyrite. Very limited amount of bedrock is exposed in the area and a deep water filled pit is present at the main showing. All samples were obtained from the exposed bedrock and none from the rock dumps beside the trenches.

There is gold present in the felsic intrusive, however, due to the limited exposure, this area required either additional trenching or preferably stripping. The gold showing area is a lower priority.

COPPER-NICKEL SHOWING:

Initial grab samples from the Copper-Nickel area ranged from 60 ppm to 0.645% Copper and 75 ppm to 4448 ppm Nickel with elevated values of cobalt up to 332 ppm, titanium from 3945 ppm to 8729 ppm and vanadium values ranging from 40 ppm to 73 ppm.

An angular siliceous porphyry float located near the porphyry - gabbro contact north of the Copper-Nickel showing returned a value of 0.473% copper, 0.094 ppm gold, 7 ppm silver, 19 ppm cobalt, 48 ppm nickel, 21 ppm lead, and 435 ppm zinc.

NORTH OF OLD HIGHWAY GOLD SHOWING:

The highest seven grab samples returned gold values from the North of Old Highway showing ranging from 0.134 opt to 4.215 opt gold. The follow-up channel samples returned values from 0.030 opt over 5.0 feet or 1.031 g/t over 1.524 m to 0.199 opt over 3.0 feet or 6.839 g/t over 0.914 m. Channel samples which were on both sides of the high grade grab sample returned 0.093 opt and 0.199 opt gold.

The author has made an observation regarding the elevated gold values. It appears that the highest values from the grab sampling and the follow-up channel sampling are confined to the area that was exposed by the old trench. Other channel samples with similar looking alteration and 5% to 7% pyrite returned very low gold values.

The northerly trending quartz stringer with sulphide mineralization located north of the water filled pit returned values of 0.057 opt gold over 2.0 feet or 1.956 g/t gold over 0.61 m and 0.030 opt gold over 5.0 feet or 1.031 g/t gold over 1.524 m.

ZINC VEIN No.2:

Due to the lack of good bedrock exposure, this vein was chip sampled from the north side of the very large water filled trench. The resulting values ranged from 560 ppm to 8.4404% zinc, 12 ppm to 837 ppm copper, 72 ppm to 1535 ppm lead, nil to 19 g/t silver, 9 ppb to 639 ppb gold, 10 ppm to 115 ppm cobalt and <100 ppm to 823 ppm titanium.

The author has made an observation of the trench pattern of the area. The axis of the trenches trend approximately north and northeast and appears to intersect within the large water filled trench. Also the dump material on the northwestern side of this trench has a quartz breccia with fine to coarse disseminated sphalerite which was not located in the surrounding outcrops and the author suspects that this material came from the possible junction of 2 vein systems.

Berry reports that this area has yielded silver values up to 32.7 opt silver. This vein in the vicinity of the felsic dike has been report to contain up to 14.44% lead associated with the high silver values. Native silver has been reported in this area, but the author has not been able to verify this information with new sampling, mainly due to overburden coverage.

ZINC VEIN No.1:

The author refers to the summary of the channel samples of Zinc Vein No.1 (Table 4) and Figure 13 as well as the follow Table 5 which summarizes the averaged values obtained from the entire length of the channel sampling sections.

Channel Number	Length (feet)	Gold Au (g/t)	Silver Ag (g/t)	Lead Pb (%)	Zinc Zn (%)	Copper Cu (%)
1	3.80	0.738	13.92	0.064	8.627	0.043
2	6.10	1.178	10.46	0.078	4.710	0.017
3	5.40	0.116	4.37	0.027	0.282	0.008
4	9.30	0.816	21.56	0.299	6.139	0.075
5	6.20	0.513	7.52	0.022	1.024	0.027
6	(this channel sampling was not done due to broken rock saw)					
7	7.30	1.085	21.16	0.101	8.339	0.055
8	8.30	0.219	17.39	0.071	0.622	0.039
9	(this channel sampling was not done due to broken rock saw)					

Table 5: Summary of averaged values over the entire channel sample length.

The author is required to indicate that channel sample 1 is only 3.8 feet in total length due to the presence of the rubble pile concealing the southern portion of the shear zone and a third sphalerite veinlet.

Also, along strike of the Zinc Vein No.1 towards the southwest are several large water filled pits approximately 5 by 6 feet and about 4 to 6 feet deep. The rock rubble beside these pits contains massive and semi-massive sphalerite.

RECOMMENDATIONS:

The author bases the following recommendation upon his 27 years of experience and knowledge in not only the exploration industry but also the mining industry.

It is recommended that the property should advance to a more detailed exploration program in the following recommended order:

- 1) Acquire the surface rights as soon as possible.
- 2) Contact a logging company to remove the trees in the area of Zinc Veins No.1 and No.2. The logging company would acquire the trees free of charge, pay the Crown stumpage fees, acquire all permits and to establish a road access at or near the north-south township line.
- 3) Mechanically strip, wash, geologically map and channel sample Zinc Vein No.2
- 4) The stripping and clearing of the area of Zinc Vein No.1 especially along strike to the southwest in the vicinity of the deep pits.
- 5) During or shortly after the completion of Item 4, a detailed grid should be established bearing in mind the orientation of the mineralization and the capabilities and limits of the proposed geophysical surveys.
- 6) The proposed geophysical surveys should consist of total field magnetics with a measured vertical gradient (not the usual calculated vertical gradient) followed by a pole dipole IP survey over selected areas.
- 7) Upon completion of the initial geophysical surveys, a Mise a la Masse survey should be conducted in the area of the copper – nickel showing.
- 8) During or shortly after the completion of 6 and 7, either selected areas or the entire property should be geologically mapped identifying areas requiring either stripping or trenching.
- 9) After the completion of Item 4, additional stripping of the Rusty Bucket gold area should be completed.

- 10) When the above recommendations are completed and all assay results are tabulated, an initial limited diamond drilling program is recommended. Commencing of the drill program should be with very shallow holes below Zinc Vein No.1, followed by Zinc Vein No.2, The Rusty Bucket gold area, geophysical anomalies related to the above 3 area, additional geophysical targets especially north of the current Highway and the North of Old Highway gold zone.
- 11) Upon compiling the results of the initial drilling of Zinc Vein No. 1 and No. 2, application for advance exploration for bulk sampling of the zones after these mining claims are brought to lease.

Phase 2 – Geophysical Surveying:

Richard Daigle of Geoserve Canada Inc. completed approximately 8.9 km of line cutting and an Induced Polarization (IP) surveying with an a spacing of 25 metres reading N=1 to N=6. Grid lines 800 North and 1000 North were also surveyed with Total Field Magnetic survey and Horizontal Loop Electromagnetic (HLEM) survey method with a coil separation of 150 metres. The grid and surveying commenced on May 23, 2004 and completed by June 15, 2004.

Figure 7 illustrates the cut grid, IP anomalies, the initial grab sample locations, generalized geology, outcrop coverage and the locations of the mineralized Zones.

IP anomaly K401 (high chargeability and low resistivity increasing at depth) may be related to either an overburden condition as it is at the edge of the swamp and outcrop or probably contact sulphide mineralization. It should be noted that in this area there are several small quartz veins with sphalerite mineralization and the K401 anomaly requires additional exploration activities.

It appears that the IP anomalies K402 (high chargeability and very high resistivity), K403 (moderate chargeability and weak resistivity) and K407 (weak chargeability and near surface low resistivity) are probably associated with the edge effects of the north-northwest trending diabase dikes. The IP grid line 800N did not detect the southern extension of Zinc Vein No.1 as the grid line was following the axis of the diabase dike.

IP anomaly K404 (weak chargeability and very low resistivity) and may be related to a contact located at or very near to the property boundary.

IP anomaly K405 (moderate chargeability and at the flank of a very high resistivity contact), K406 (moderate chargeability and moderately deep low resistivity) and K408

(weak chargeability and high resistivity) are located in the swamp areas and may be related to sulphide mineralization at or near the contact of the gabbro and felsic intrusive to the southwest of the copper-nickel showing.

The IP survey on Line 1450E at approximately 1050N was just east of the Cu-Ni mineralization and indicated very weak chargeability response with an increasing resistivity response at depth.

IP anomaly K409 (two weak chargeability and a broad resistivity anomaly) is located on the northwest and southeast side of the North of Old Highway gold showing. The survey line was at or very near to the contact of the gabbro (southwest) and the quartz feldspar porphyry (northeast). The western anomaly is near surface and may be related to sulphide enrichment in the gabbro. The North of Old Highway gold showing is probably related to the moderate resistivity and contact mineralization between 1800E and 1900E and probably plunges in a southeasterly direction at depth..

IP anomalies K410 (moderate chargeability and high resistivity both near surface) is located just west of the southern portion of Zinc Vein No.1 and may have either located a parallel to sub parallel structure similar to the vein or are a result of the side seeking effect of the IP survey. K411 (high chargeability at moderate depth and high resistivity near surface) may be related to Zinc Vein No.1 or a parallel structure to the shear zone and vein. K412 (moderate chargeability and high resistivity both near surface) and appears to be related to the overburden and outcrop affect. The IP survey on Line 2000E between K410 and K411 indicates that the tongue of the felsic intrusive to the east may extend further westerly than previously known.

IP anomalies K413 (weak chargeability with no resistivity effect) appears to be structurally south of the northerly trending quartz vein that is exposed on the north side of the water filled pit in the North of Old Highway gold showing. This anomaly may be

related to this vein structure and since the vein and associated sulphide mineralization is approximately 4 feet wide may not be detected with an IP spacing of 25 metres.

IP anomalies K414 (high chargeability and high resistivity) is located at the end of Line 2000E in an area of small outcrops and may be related to a felsic intrusive or siliceous zone. Previous mapping indicates that gabbroic rocks underlie the area. This particular anomaly requires additional exploration activities.

At or near the junction of Line 2000E and Line 1000N, the area is underlain by a very high resistivity with no chargeability anomaly and may indicate a large felsic intrusive body.

Addition by Hermann Daxl, M.Sc., Geologist

Induced Polarization by Exsics

As Geoserve tested only a few areas of the claims, it was thought necessary to test also at least the main showing, Zinc Vein 1, and to tie in some parts of their survey. Therefore two additional lines, L1600mE (TL16E-southern part) and L1150mN, were surveyed with Pole-dipole Induced Polarization, $a=25m$, $n=8$, by Exsics Exploration Limited, on 3 Nov 2004. Infinities were placed at L1600E-1725N some 60m S of a powerline, and in the S-trench of the highway 500m to azimuth 333 from L1150N-1600E (the telephone line is buried on the northside), as the lines were read going SW and SE respectively. The following interpretation relies on some known geology. Two sections are attached. True Depth sections and Spectral IP interpretations will be added soon.

L1150mN:

The sub-vertical Zinc Veins 1 and 2 run perpendicular to this line and cross it at 2060E and 1910E respectively (pages 25 and 26). Zinc Vein 1 is a <40 cm thick quartz-sphalerite vein with rare spots of chalcopyrite and is known over 45m. Zinc Vein 2 is poorly exposed and may be much smaller, as this IP indicates. The several outcrops are mainly non-magnetic gabbro. The high chargeability and high resistivity between these two veins would fit such a quartz-zinc vein system and shows as well on the IP of L2000E. The slope eastward from Zinc Vein 1 to the swamp would turn barren.

West of Zinc Vein 2 the near surface high chargeability with moderate resistivity around 1850E is similar to such an anomaly around L1600mE-1290N.

The deep-seated high chargeability with low resistivity around 1775E could be a mineralized ultramafic like in the small nickel-copper showing. The overlying outcrops require detailed prospecting especially around 100m northeast because of side-seeking.

L1600mE:

The near surface extreme chargeability and moderate resistivity around 1290N coincides with the only outcrops on this section, namely magnetic gabbro with aplite dikes. Similar to L1150N-1850E, these need intense prospecting.

The low-moderate chargeability with moderate resistivity from surface to depth on section L1600E between 800N and 875N, near L800N which crosses at 840N, seems to fit a small outcrop dug-up 15m S of L800N-1635E, which is a silicified gabbro with quartz-carbonate veins that contain <5mm cubes of pyrite. Analyses will be added later. Considering similar nearby anomalies along L800N, but only this one on this L1600E, this system may be sub-parallel to L800N.

Conclusions:

Induced polarization seems herewith suitable to explore for all three types of mineralization encountered so far on this Four Corners Property, namely quartz-sphalerite veins with CuAgAu, pyrite cubes with gold in felsic rocks, and disseminated Ni-Cu sulfides in ultramafic rocks. This IP should therefore be continued over the whole property with lines at 200m and infill where justified. N-S lines would have been more practical for this. Location, description, and analyses of samples from my prospecting are attached.

3012747 Claim number

Samples taken in Kamiskotia area, by Hermann Daxl, May 2003,

plotted on sketch, NAD83, used 9 degree W declination:

PG 101 From rubble around pit at west end of <50cm thick 50m long vein, 224/80, locally branching over 3m. 25% sphalerite often as druses, 20% quartz, and wallrock. Mostly non-conductor, non-magnetic, sample excludes the few chalcopyrite patches which respond to Beep Mat.

PG 102 From same vein but taken in place all along. 35% sphalerite, is medium-brown but weathers reddish dark gray, light brown streak, H=3, 25% quartz, 40% wallrock gabbro.

PG 103 Sheared fine gabbro wallrock of vein, mainly towards SW end. Non-magnetic, H=3-5, barren, 1% quartz plating.

PG 104 Quartz-feldspar veins <2cm in silicified gabbro, 30% each, some muscovite, non-magnetic, barren. North-side of highway.

PG 105 Fine, greenish dirty-black ultramafic, white streak despite many black sparkles, trace pyrite, H=2-4, non-conductor, non-magnetic.

PG 106 From 30cm thick >5m long quartz vein, 175/90, in perpendicularly fractured fine gabbro wallrock of H=6. Seems in place but dug out much around. 50% barren quartz vein with 50% wallrock, trace pyrite, some black sparkles but non-magnetic.

PG 107 Fine greenish ultramafic, serpentinized, H=2-5, 10% interstitial pyrite, several fine sparkles of bluish slender triangular crystals faces, moderately magnetic, very conductive from pyrite to pyrite.

PG 108 225/70 sheared medium-grained mela-gabbro, rare silicification, H=3-5. Trace pyrite cubes, non-magnetic.

PG 109 From rubble around pit, greenish-brownish silicified, or sheared rhyolite? H=6, 15% <3cm quartz veins, rare pyrite cubes, non-magnetic.

Samples taken in Kamiskotia area by Hermann Daxl in June 2003,
plotted on sketch, NAD83, used 11 degree W declination:

- PG 110 Fine, black gabbro, H=4, rare pyrite, very weakly magnetic, may be wallrock.
- PG 111 Fine, gray leuco-gabbro, H=6, 10% <2cm quartz veins, 0.5% <5mm pyrite cubes in quartz veins and rock, nonmagnetic.
- PG 112 Quartz-veins in 40% of epidotized rhyolite, H=6, barren, nonmagnetic.
- PG 113 Quartz-vein, 215/80, <5cm thick, rare pyrite cubes in wallrock, brown weathered carbonate seams, nonmagnetic, includes 10% of PG 114.
- PG 114 Medium-grained greenish gabbro, much brown carbonate alteration, H=3, barren, nonmagnetic, wallrock of PG 113.
- PG 115 Beige rhyolite, sheared 93/90, H=5, 5% quartz-veins <1cm, barren, nonmagnetic.
- PG 116 Fine, beige to greenish to brownish granite, with 5% each separate carbonate and quartz veining <2cm, trace local pyrite cubes.
- PG 117 Medium-grained to coarse, medium-gray quartz-mela-gabbro, dark-green pyroxene, carbonate-rich as per brown weathering crust, 0.3% pyrite, 0.1% ilmenite?, H=4-6, moderately magnetic, country rock.

IP by EXSICS

IP by GEOSERVE

Geophysical Summary Report

Kamiskotia Prospect

Porcupine Mining Division, District of Cochrane
Northeastern Ontario

Pele Mountain Resources Inc.

Toronto, Ontario.

Richard Daigle
Geoserve Canada

June 15th, 2004

Richard Daigle was commissioned by Pele Mountain Res. Inc. to geophysically assess mineralized zones on the Kamiskotia 2004 Prospect. The property being worked on comprises 11 non patented claims (approx. 680 acres) in Jamieson, Turnbull, Godfrey, and Robb Townships, owned by local prospectors of the Timmins, ON, area..

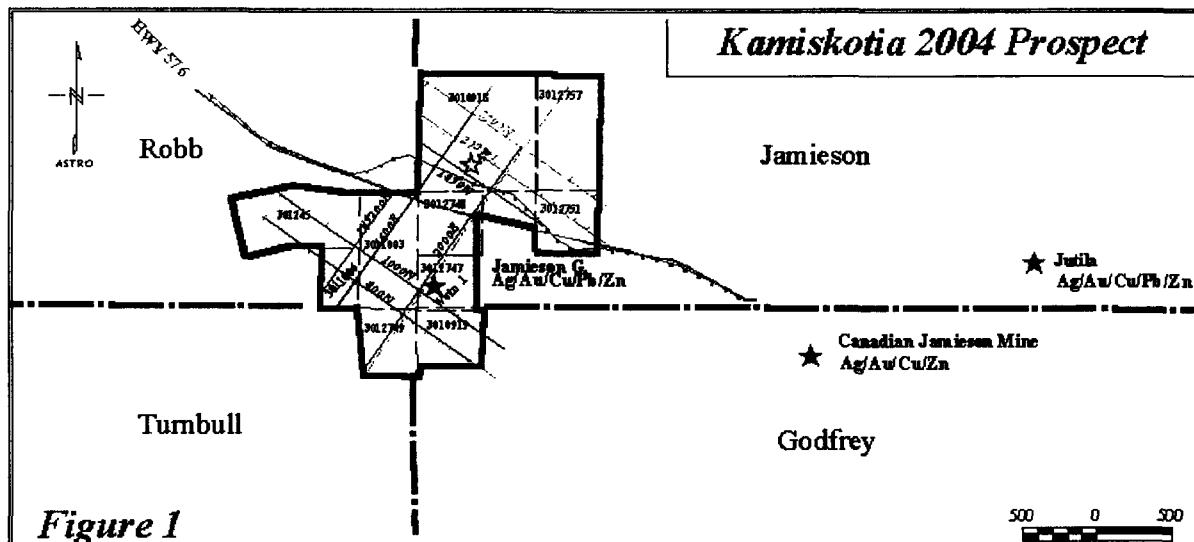

Figure 1

The property is geologically situated within the Kamiskotia Gabbroic Complex which has hosted four volcanogenic massive sulphide deposits (OGS Study 59, C.T. Barrie, 2000). It also lies in the Porcupine Mining Camp which has produced beyond 70 million ounces of gold in the last century.

A time domain Induced Polarization survey, $a=25m$ $n= 1$ to $n=6$, along with some Total Field Mag and Horizontal Loop surveys was conducted over a broad spaced interval on some of the claims being assessed. The Total Field Mag and Max-Min (150m cable HLEM) surveys completed on Lines 800N, 1000N is presented on the IP Sections.

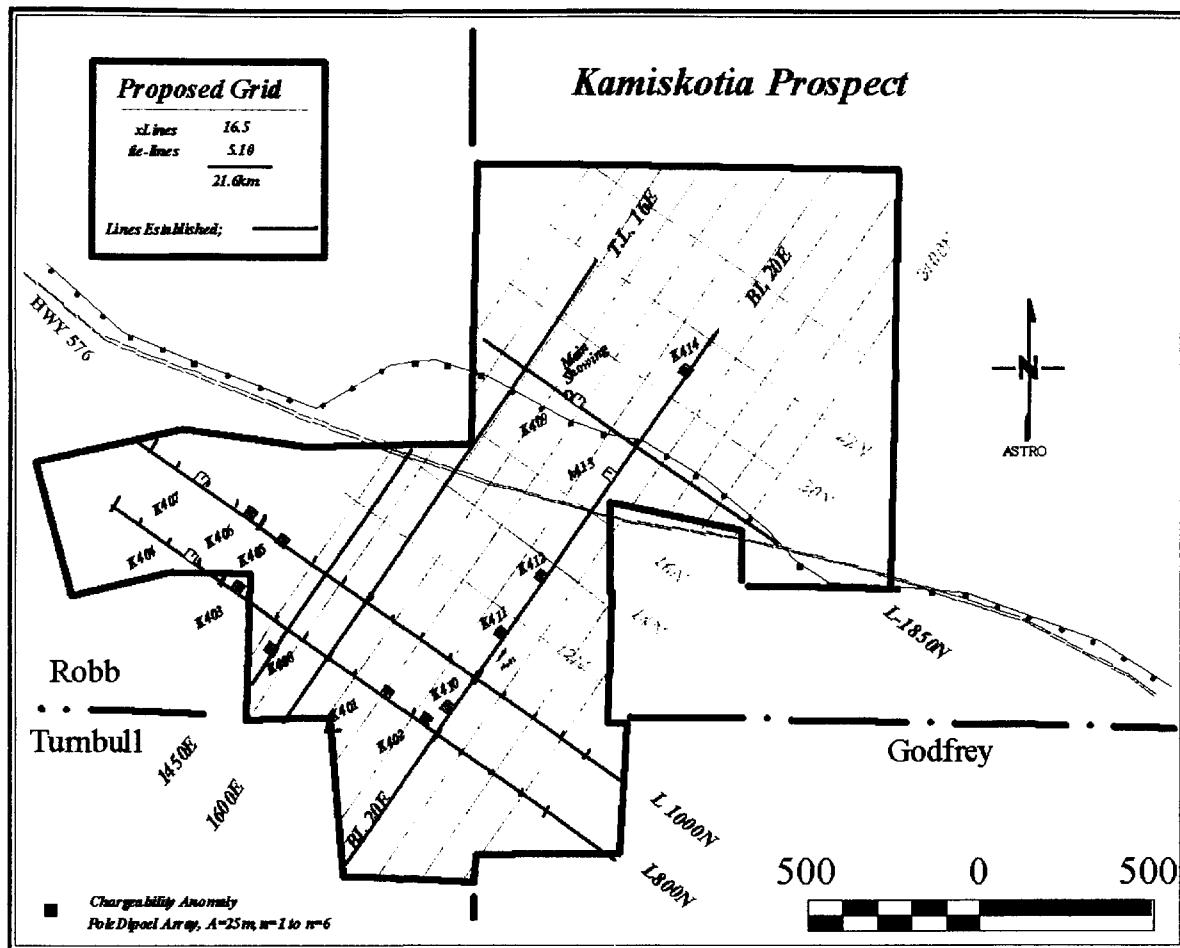

The survey has successfully identified several zones of significance with potential good depth extent. Interpretations can be seen on 1:5000 Sections presented.

Anomaly **K409** (L1850N/1850E) and **K413** (BL20E/17N) are postulated to be the same zone striking approximately 330° Az. which correlates with the mapped Au showing (striking 320° Az.). Anomaly **K414** (BL2000E/ 2100N) which is open (not completely defined) grid north is indicative of a magmatic type deposit neighboring (derived from a sample taken by the author showing mineralization along a fracture zone). The third significant anomaly **K411** shows better at depth and lies within 70m of vein #1, drill testing is required to evaluate this anomaly. All of these zones need follow-up to better evaluate their economic potential. There lies another anomaly of interest **K403** occurring at a contact (as per resistivity section) which represents a disseminated sulphide zone with depth extent.

The author recommends additional mapping near and around anomaly **K411** and **K414**.

Any additional work is left to the clients discretion.

The following figure shows all delineated IP anomalies along cut lines and a proposed grid representing a budget of \$32,000.00 comprising line cutting, total field magnetics, and Induced Polarization surveys.

June 16, 2004

Richard J. Daigle

I declare to have no interest on the claims being worked on.

(3)

See JENSEN p. 20-22.

Dear Sir or Madam

Submission Number: 2.28860
Transaction Number(s): W0460.01865

Subject: Approval of Assessment Work

We have approved your Assessment Work Submission with the above noted Transaction Number(s). The attached Work Report Summary indicates the results of the approval.

At the discretion of the Ministry, the assessment work performed on the mining lands noted in this work report may be subject to inspection and/or investigation at any time.

If you have any question regarding this correspondence, please contact BRUCE GATES by email at bruce.gates@ndm.gov.on.ca or by phone at (705) 670-5856.

Yours Sincerely,

A handwritten signature in black ink, appearing to read "S. Lessard".

General Information and Limitations

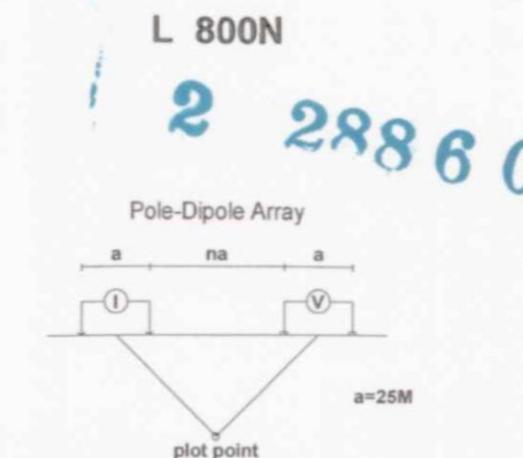

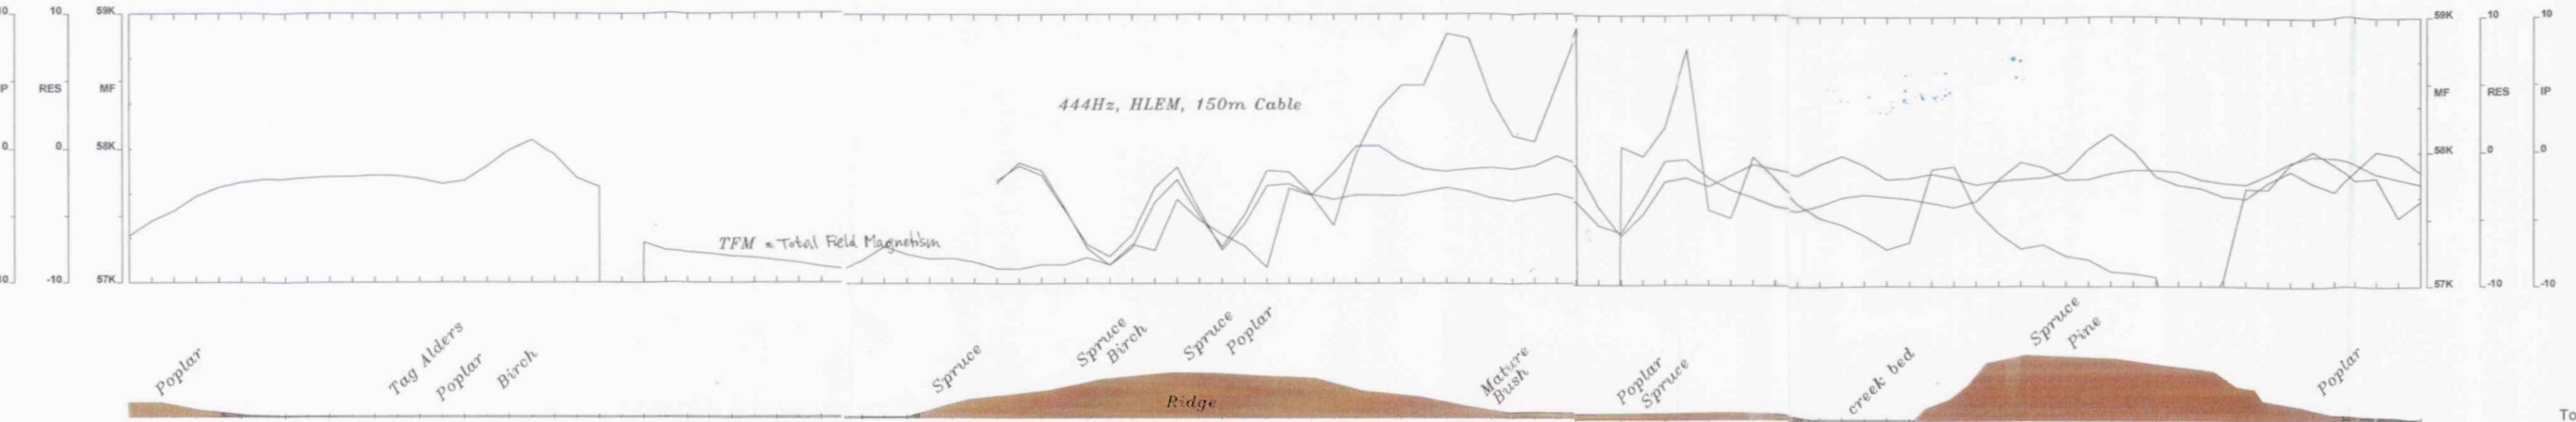

These mining or estate mining claims should consult with the Provincial Mining Recorder's Office of the Ministry of Northern Development and Mines for additional information on the status of the lands shown herein. This map is not intended for navigation, survey, or land determination purposes as the information shown on this map may be compiled from various sources. Completeness and accuracy are not guaranteed. Additional information may also be obtained through the local Land Titles or Registry Office, or the Ministry of Natural Resources.

Contact Information:
