PROJ# 6-141

RECEIVED

SEP 6 1988

MINING LANDS SECTION

AUGUST 1988

D. LONDREY
TIMMINS GEOPHYSICS LTD.

SUMMARY AND RECOMMENDATIONS

Horizontal loop EM and magnetic surveys were carried out on Comstate's Reid property during November of 1987 and February of 1988.

The magnetic survey outlined north-northwest striking diabase dikes and west-northwest striking ultramafics. Five HLEM anomalies reflect steeply dipping conductors which represent potential drill targets.

Anomaly 'A' reflects a graphitic horizon with minor pyrrhotite, except between 0 and 450 East where the conductivity is due to pyrite pyrrhotite mineralization. The narrow width of the source is not encouraging for a large, near surface massive sulphide deposit. This zone should be tested below previous drilling on Line 100 East where there is good conductivity and magnetic correlation.

Anomalies 'B' to 'E' reflect graphitic sediments at, or close to, a contact between volcanics to the north and ultramafics to the south; these conductors may also be related to an east-west structure. Mineralized quartz veins intersected in previous drilling were not sampled for gold.

INTRODUCTION

During November 1987 and February 1988, magnetic and horizontal loop electromagnetic (HLEM) surveys were carried out for Comstate Resources Ltd. on their Reid property.

The property is located approximately 35 kilometres north of the city of Timmins, in the Porcupine Mining Division (Figure 1). It consists of 53 claims, 49 in the northeast corner of Reid Township and 4 which cover the S1/2 Con IV Lot 12, Carnegie Township. The claims are numbered as follows:

P 952096	-	952101	inclusive
P 952106	-	952109	inclusive
p 952113	-	952147	inclusive
P 981685	-	981689	inclusive
P 997441			
P 1026841	-	1026842	inclusive

A power line from the Lower Sturgeon Dam, four kilometers to the north on the Mattagami River, runs north-south through the middle of the property. A road along the power line can be accessed from the Abitibi Lumber Camp 40 road, which can be accessed from Highway 655.

The field crew included B. Pigeon, K. Cybulski and J. DerWeduwen.

PREVIOUS WORK

Since 1964 a number of companies have filed geophysical assessment work on parts of the Reid property (Table 1).

Texmore Mines Limited carried out magnetic and Vertical Loop EM (VLEM) surveys over the east half of the property in 1964. It was recommended to test conductive zones by diamond drilling, however, no drill results were filed. In the same year, Canadian Javelin Limited also ran magnetic and VLEM surveys over the west half of the property, as a followup to

TABLE 1: Summary of Previous Work

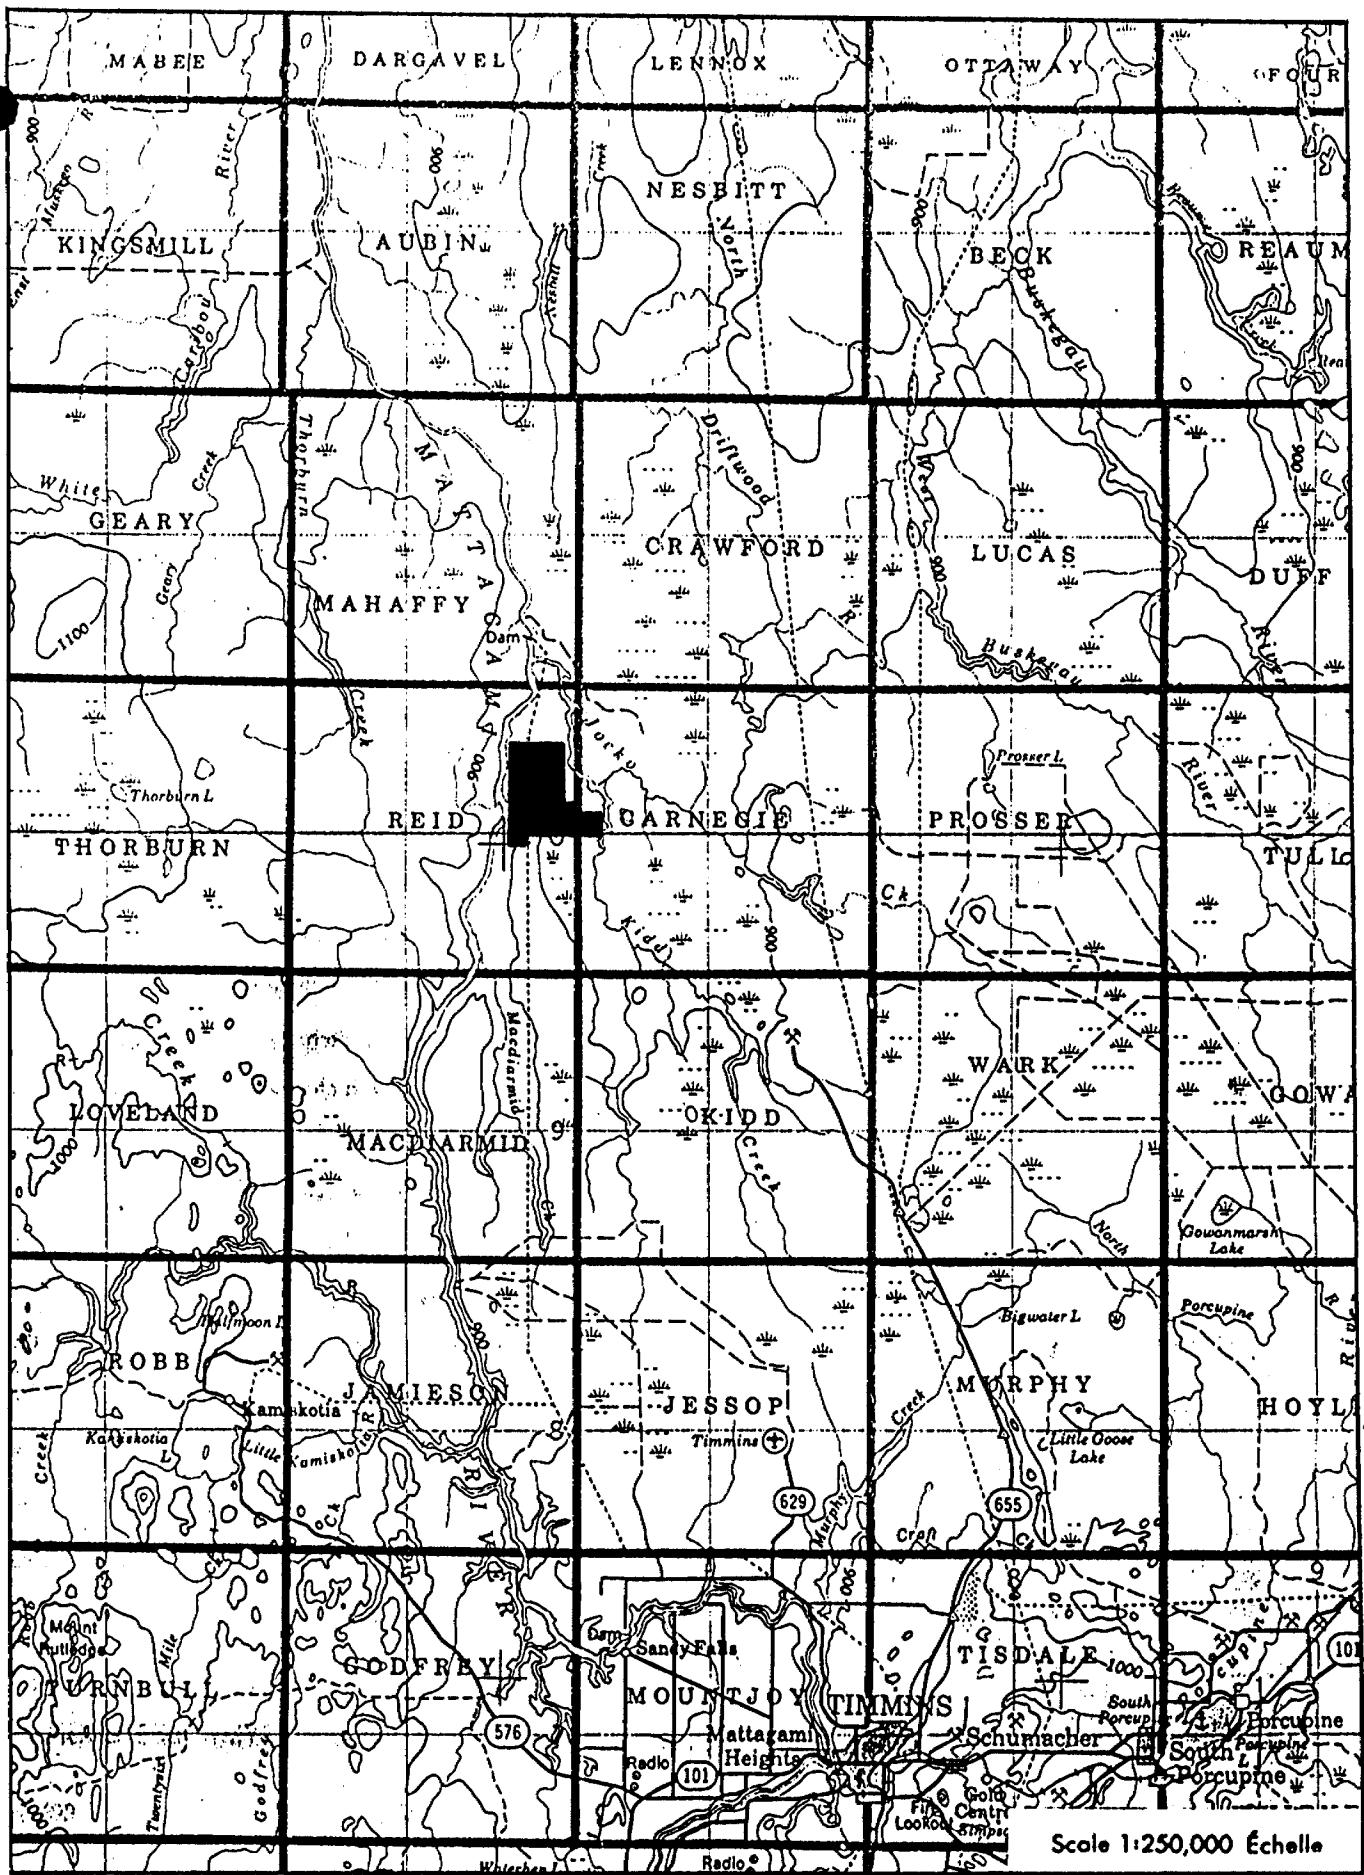

Figure 1: Location map

an airborne magnetic and EM survey. Hole H-1/1 was drilled just to the west of the present grid, on strike with conductor 'C'; it intersected a number of pyritic graphite zones.

In 1964 magnetic and EM surveys were also run on the E. Abel property which covered the four claims in Carnegie Township. It was recommended that three drill holes test a west-northwest striking conductor outlined in the EM survey.

International Nickel Co. of Canada Ltd. drilled two holes on the property in 1967. Hole 32912 intersected graphite within acidic volcanics and Hole 32911 intersected graphite within intermediate volcanics. The exact location of these holes is difficult to determine, however, from the distance between them, it appears as though they tested conductors 'A' and 'B' respectively.

Mattagami Lake Mines Limited filed an airborne Input survey flown by Questor in 1970 and also four holes drilled in 1972. Holes A2-72-1 and A2-72-3 were both drilled to test conductor 'C' and intersected graphitic sediments with up to 3% pyrite. Hole A2-72-2, drilled to test conductor 'B', intersected graphitic sediments with narrow bands of massive pyrite and pyrrhotite. The target of Hole T-CL-72-1 was the source of anomaly 'D'. It intersected a graphitic unit between rhyolites to the north and peridotite to the south.

In 1974 Newmont Mining Corp. carried out magnetic and Induced Polarization (IP) surveys; a gradient array was used in the IP survey. An east-west striking resistivity and

chargeability anomaly coincides with EM anomalies 'B' and 'C'. Hole R-75-8, drilled to test this anomaly, intersected peridotite.

In 1979 and 1980 Gulf Minerals Ltd. carried out an exploration program in the area which included overburden drilling, an airborne magnetic and EM survey, ground magnetic and EM surveys and diamond drilling. Three holes, R-80-D-3, R-80-D-4 and R-80-D-6, were drilled to test conductor 'A'. Hole R-80-D-11 was drilled to test conductor 'B' and R-80-D-13 tested conductor 'C'.

In 1980 Rosario carried out magnetic and horizontal loop EM surveys over the four claims in Carnegie Township. Recommendations were made to test two west-northwest striking conductors which are on strike with conductors 'D' and 'E'.

SURVEY DESCRIPTIONS

In 1987 an east-west baseline was established at 0 North; north-south grid lines were cut every 100 metres from 800 North to 1200 South between 700 West and 1200 East. Detail lines, spaced every 50 meters, were also cut from 100 North to 600 South between 0 and 500 East. Tie lines were cut at 800 North, 600 South and 1200 South. In 1988 the lines were extended to the south from Tie Line 1200 South.

The horizontal loop EM survey was carried out with the Apex Parametrics Max Min I. This instrument measures the

inphase and quadrature components of the secondary field as a percentage of the primary field. Readings were taken every 25 metres using a coil separation of 150 metres and frequencies of 444, 1777 and 3555 Hz.

The magnetic readings were taken with a Scintrex IGS-2/MP-4. This instrument is a proton precession magnetometer which measures the earth's total magnetic field to an accuracy of .1 gammas. The diurnal drift was monitored every 30 seconds with a Scintrex MP-3 base station magnetometer.

HLEM RESULTS

The horizontal loop results are plotted on maps 1, 2 and 3 at a scale of 1:2500. The profile scale on the 444 and 1777 Hz results is $1\text{cm}=20\%$ and the scale on the 3555 Hz results is $1\text{cm}=40\%$. Five bedrock conductors, labelled 'A' to 'E' on the maps, were detected in the survey. A summary of previous work carried out over each of these zones is given in Table 2.

A conductive overburden layer on the property causes an inversion of the quadrature component over the conductors. The parameters in Tables 3 to 7 were calculated using the lowest frequency, where the inversion is least pronounced. Even at 444 Hz, however, the depth and conductivity thickness

TABLE 2: Summary of Conductors

calculations may be higher than the true values. The power line along Line 0 is responsible for the slightly noisier readings and higher background in the results along that line.

Anomaly A reflects a narrow conductor which strikes west-northwest through the middle of the property. The conductivity of the source decreases and the depth increases as you move east and west from 200 East; the dip is near vertical (Table 3). The EM anomaly coincides with a magnetic anomaly which is highest between 0 and 450 East. Previous drilling has shown that Anomaly 'A' reflects a graphitic horizon with minor pyrrhotite except between 0 and 450 East where the conductivity is due to pyrite pyrrhotite mineralization. Traces of chalcopyrite were noted in the

Table 3: HLEM Anomaly A, 444 Hz, 150 m coil separation.

logs from Holes R-80-D-3 and R-80-D-6, drilled by Gulf Minerals. On the east side of the property the conductor is slightly offset where two north-south diabase dikes cut the zone.

Anomaly 'B' strikes west-northwest between 300 East and 300 West. It reflects a 20 metre wide conductor approximately 35 metres below surface which dips steeply to the north (Table 4). The conductivity of the zone is poor to good.

LINE	ANOMALY CENTRE	ANOMALY WIDTH (M)				CONDUCTIVITY THICKNESS (MHOS)	COMMENTS
			IP (%)	Q (%)	DEPTH (M)

0 W	719 S	?	?	?			INTERFERENCE FROM 'C'
100 E	755 S	17	-12	-9	45	22	STEEP N DIP
200 E	812 S	16	-13	-12	34	17	STEEP N DIP
300 E	837 S	25	-6	-9	32	8	STEEP N DIP

Table 4: HLEM Anomaly B, 444 Hz, 150 m coil separation.

Anomaly 'C' is located between 0 East and the west edge of the property. It reflects a narrower conductor at a greater depth than 'B'; the dip is steep to the south and the conductivity is good to very good (Table 5). There does not appear to be any lateral movement along a diabase dike which cuts the conductor on the west side of the property.

Between 300 West and 200 East anomalies 'B' and 'C' are 100 metres apart which makes width and dip values difficult

to calculate. Both conductors are located within an area of an anomalously low magnetic field; previous drilling has determined that the source of these anomalies is pyritic graphite. Hole R-80-D-11, drilled by Gulf Minerals in 1980

Table 5: HLEM Anomaly C, 444 Hz, 150 m coil separation.

to test anomaly 'B' intersected a four foot wide mineralized quartz vein within the graphitic zone; it does not appear to have been sampled.

Anomalies 'D' and 'E' are located to the east and on strike with anomalies 'B' and 'C'. Anomaly 'D' reflects a very good conductor up to 30 metres wide at a depth of 60 to 80 metres (Table 6). Anomaly 'E' reflects a narrow conductor between 1100 and 1500 East, approximately 200 metres south of conductor 'D'. The conductivity of this zone decreases from west to east (Table 7). The dip of these two zones is difficult to determine because of the short distance between them.

Table 7: HLEM Anomaly E, 444 Hz, 150 m coil separation.

The source of the other weak anomalies outlined, but not labelled, on the high frequency results have very poor conductivities and are likely surficial.

MAGNETIC RESULTS

The magnetic results are plotted on map 3 at a scale of 1:2500.

North-northwest striking diabase dikes, labelled 'DD' on the magnetic map, are reflected by linear magnetic anomalies up to 700 gammas above background. Offsets or changes in strike of these features suggest the presence of a major west-northwest striking fault zone. Conductors 'B' and 'D' are located along the north edge of this break in the dikes and conductors 'C' and 'E' are located along the south edge.

Previous drilling suggests that the discontinuous west-northwest striking magnetic high anomalies to the south of the break, described in the previous paragraph, reflect ultramafics. Magnetic lows along these trends, such as on Lines 200 and 300 East, may reflect alteration.

As mentioned in the previous section, the magnetic anomaly associated with conductor 'A' reflects pyrrhotite mineralization.

Electromagnetic <u>20</u> days	P 952100-101 952121 952127 to 144 1026841-842
Magnetometer _____ days	
Radiometric _____ days	
Induced polarization _____ days	
Other _____ days	
Section 77 (19) See "Mining Claims Assessed" column	
Geological _____ days	
Geochemical _____ days	
Man days <input type="checkbox"/>	Airborne <input type="checkbox"/>
Special provision <input checked="" type="checkbox"/>	Ground <input checked="" type="checkbox"/>
<input type="checkbox"/> Credits have been reduced because of partial coverage of claims. <input type="checkbox"/> Credits have been reduced because of corrections to work dates and figures of applicant.	

Special credits under section 77 (16) for the following mining claims

10 days Electromagnetic

P 952145 to 147 inclusive

5 days Electromagnetic

P 952098-099

No credits have been allowed for the following mining claims

not sufficiently covered by the survey

insufficient technical data filed

P 952096-097
952106 to 109 inclusive
952113 to 120 inclusive
952122 to 126 inclusive

The Mining Recorder may reduce the above credits if necessary in order that the total number of approved assessment days recorded on each claim does not exceed the maximum allowed as follows: Geophysical - 80; Geologocal - 40; Geochemical - 40; Section 77(19) - 60.

Dear Sir:

Re: Notice of Intent dated November 8, 1988
Geophysical (Electromagnetic & Magnetometer) Survey submitted on
Mining Claims P 952096 et al in Reid and Carnegie Townships

The assessment work credits, as listed with the above-mentioned Notice of Intent, have been approved as of the above date.

Please inform the recorded holder of these mining claims and so indicate on your records.

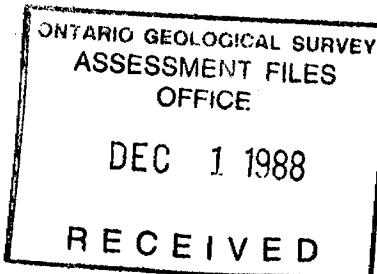

Yours sincerely,

W.R. Cowan
Provincial Manager, Mining Lands
Mines & Minerals Division

FACTS SHOWN HERE NEED NOT BE REPEATED IN REPORT
TECHNICAL REPORT MUST CONTAIN INTERPRETATION, CONCLUSIONS ETC.**

Type of Survey(s) Geophysical

Township or Area Reid / Carnegie

Claim Holder(s) Comstate Resources Ltd.

Siute 901, 1015 4th St. SW Calgary, Alberta
T2R 1J4

Survey Company Timmins Geophysics

Author of Report Douglas Londry

Address of Author P.O. Box 1783 South Porcupine, Ontario
P4N 1H0

Covering Dates of Survey Oct. 1, 1987 to Aug. 31, 1988
(linecutting to office)

Total Miles of Line Cut 81.7 km

MINING CLAIMS TRAVESED
List numerically

see Schedule A
.....
(prefix) (number)

SPECIAL PROVISIONS
CREDITS REQUESTED

ENTER 40 days (includes
line cutting) for first
survey.

ENTER 20 days for each
additional survey using
same grid.

	DAYS per claim
Geophysical	
—Electromagnetic	20
—Magnetometer	40
—Radiometric	
—Other	
Geological	
Geochemical	

AIRBORNE CREDITS (Special provision credits do not apply to airborne surveys)

GEOPHYSICAL TECHNICAL DATA

GROUND SURVEYS — If more than one survey, specify data for each type of survey

HLEM 1830

Number of Stations 3198 Number of Readings mag 4422
Station interval 25 metres Line spacing 100 metres
Profile scale HL: 1 cm = 20%
Contour interval mag: 50 gammas

MAGNETIC

Instrument Scintrex IGS-2/MP-4
Accuracy — Scale constant 0.1 gammas
Diurnal correction method base station
Base Station check-in interval (hours) 30 seconds
Base Station location and value 1200 South, 50 East
58795 gammas

ELECTROMAGNETIC

Instrument Apex Parametrics MaxMin I
Coil configuration horizontal loop
Coil separation 150 metres
Accuracy ±1%
Method: Fixed transmitter Shoot back In line Parallel line
Frequency 444, 1777, 3555 Hz (specify V.L.F. station)
Parameters measured in-phase and quadrature components of the secondary field
measured as a percent of the primary field

GRAVITY

Instrument _____
Scale constant _____
Corrections made _____

Base station value and location _____

Elevation accuracy _____

INDUCED POLARIZATION
RESISTIVITY

Instrument _____
Method Time Domain Frequency Domain
Parameters — On time _____ Frequency _____
— Off time _____ Range _____
— Delay time _____
— Integration time _____
Power _____
Electrode array _____
Electrode spacing _____
Type of electrode _____
