Diamond Drilling:

Fourteen diamond drill holes were put down on the J-10 property to test the conductors outlined by the EM survey.

Seven drill holes were located on each portion of the claim group, for a total of 5,724 feet.

The drilling was performed by Boyles Bros. (Que.) Ltd. of Noranda, Quebec, using two BBS-2 drill machines taking "AX" (1") core. The program was conducted from 9 June to 9 August, 1964.

In all but two locations surface outcrop was within less than 100 feet of any hole, hence very little overburden was encountered. In holes J-10/6-W and J-10/7-W the nearest surface outcrop was over 2000 feet to the southwest and, in these instances, the overburden depth was over 75 feet vertically.

The diamond drill logs, and sample assay results are shown on the following pages.

NOTE TO FILE: PAGES 1-14 AND 67-72 ARE INCORPORATED WITH

112.0 - 118.5	6.5	Graphite with disseminated pyrite, ground core 113.0 - 114.0, 116.0 - 117.0.
118.5 - 130.5	12.0	Fine grained, thinly bedded sediments or ash with chloritized and serpentinized shear faces. Core angle: 60°.
130.5 - 132.0	1.5	Thin interbedded graphite and calcite with thinly banded pyrite.
132.0 - 156.5	24.5	Same as 118.5 - 130.5', slightly stronger mineralization and minor chalcopyrite present. Very strong pyrite-pyrrhotite at 140.0 - 141.0'.
156.6 - 157.5	1.0	Graphite interbedded with calcite, with minor disseminated pyrite. Core angle: 60°.
157.5 - 161.0	3.5	Same as 118.5 - 130.5'.
161.0 - 167.5	6.5	Fine grained graphite with disseminated and nodular pyrite. Zone cut by quartz and calcite stringers. Core angle: 60°.
