AIRBORNE MAGNETIC SURVEY
NORCEN ENERGY RESOURCES LTD.
TIMMINS AREA, ONTARIO.
FILE NO: 21005 JULY, 1979

Questor Surveys Limited, 6380 Viscount Road, Mississauga, Ontario L4V 1H3

INTRODUCTION

This report contains our interpretation of the results of an airborne magnetometer survey flown in the Timmins Area, Ontario on May 11, 12, 13, 14 and 15, 1979.

The total survey was 1699 line miles and the survey was performed by Questor Surveys Limited. The survey aircraft was a Britten Norman Trislander C-GNKW and the operating base was Timmins, Ontario.

The area outline is shown on a 1:250,000 map at the end of this report. This is part of the National Topographic Series, sheet number 42A.

The following people were involved with the survey:

Pilot	Pat Harbord
Co-Pilot	Gary Robertson
Operator	Garry Mason
Engineer	Mike Kohlruss
Crew Manager	John Darwent

MAP COMPILATION

The base maps were produced from uncontrolled mosaics using National Air Photo Library 1" = 4300 feet (approximate) photographs. These mosaics were reproduced at a scale of 1" = 1320 feet on stable transparent film from which white prints can be made.

Flight path recovery was accomplished by comparison of the prints of the 35mm film with the mosaic in order to locate the fiducial points. These points are approximately 4,500 feet apart.

SURVEY PROCEDURE

Terrain clearance was maintained as close to 400 feet as possible. A normal S-pattern flight path using approximately one mile turns was used. The equipment operator logged the flight details and monitored the instruments.

A line spacing of 660 feet was used.

INTERPRETATION

BLOCK A

The higher intensity magnetic features in the south half of Tully Township appear to be related to serpentized peridotite and diorite. The strike in this area is generally east-west with some rock types striking northeast-southwest in the southwest corner of Tully Township. Some of the more subtle magnetic trends are probably due to magnetite within a basic volcanic complex. The magnetic lows generally correlate with felsic volcanics to felsic intrusive rock types although basic volcanics could be void of any magnetics. There are a few diabase dykes traversing north-south through Tully Township. However, after referring to the magnetic maps, there do not appear to be any north-south trending magnetic features within the confines of the survey area in Prosser or Little Townships. The extremely high intensity magnetic feature in the northeast corner of Little Township is related to a serpentized peridotite. This part of the ultrabasic rock type is just a small portion of the total ultrabasic complex. With the exception of a few subtle magnetic features in Little Township, the magnetics are generally low or flat. This is a reflection

of the rock types being void of magnetite and that felsic rock types are predominate in this township.

BLOCK B

Block B covers the eastern half of MacDiarmid Township and Jamieson Township. The strike of the geology is roughly in an east-west direction with a few folds such as in the central part of Jamieson Township. The extremely high intensity magnetic feature in the central part of MacDiarmid Township correlates with a serpentized dunite. The rock type extends well to the west from the survey area. Gabbro has been mapped as being the rock type in the east central part of Jamieson Township. The main part of the trend strikes east-west but then it folds to the north on the east side of the Mattagami River. Similar rock type has also been indicated to be in the area west of the Mattagami River near the south township line of Jamieson Township. There are also a few diabase dykes in this area to confuse the picture slightly. Because there are so many diabase dykes in Block B, the feeling is that the geology is striking in a north-northwest direction when one refers to the magnetic maps. However, this is certainly not the case. Referring to Preliminary Map No. 521, it will be noted that the geology strikes roughly in an east-west direction.

BLOCK C

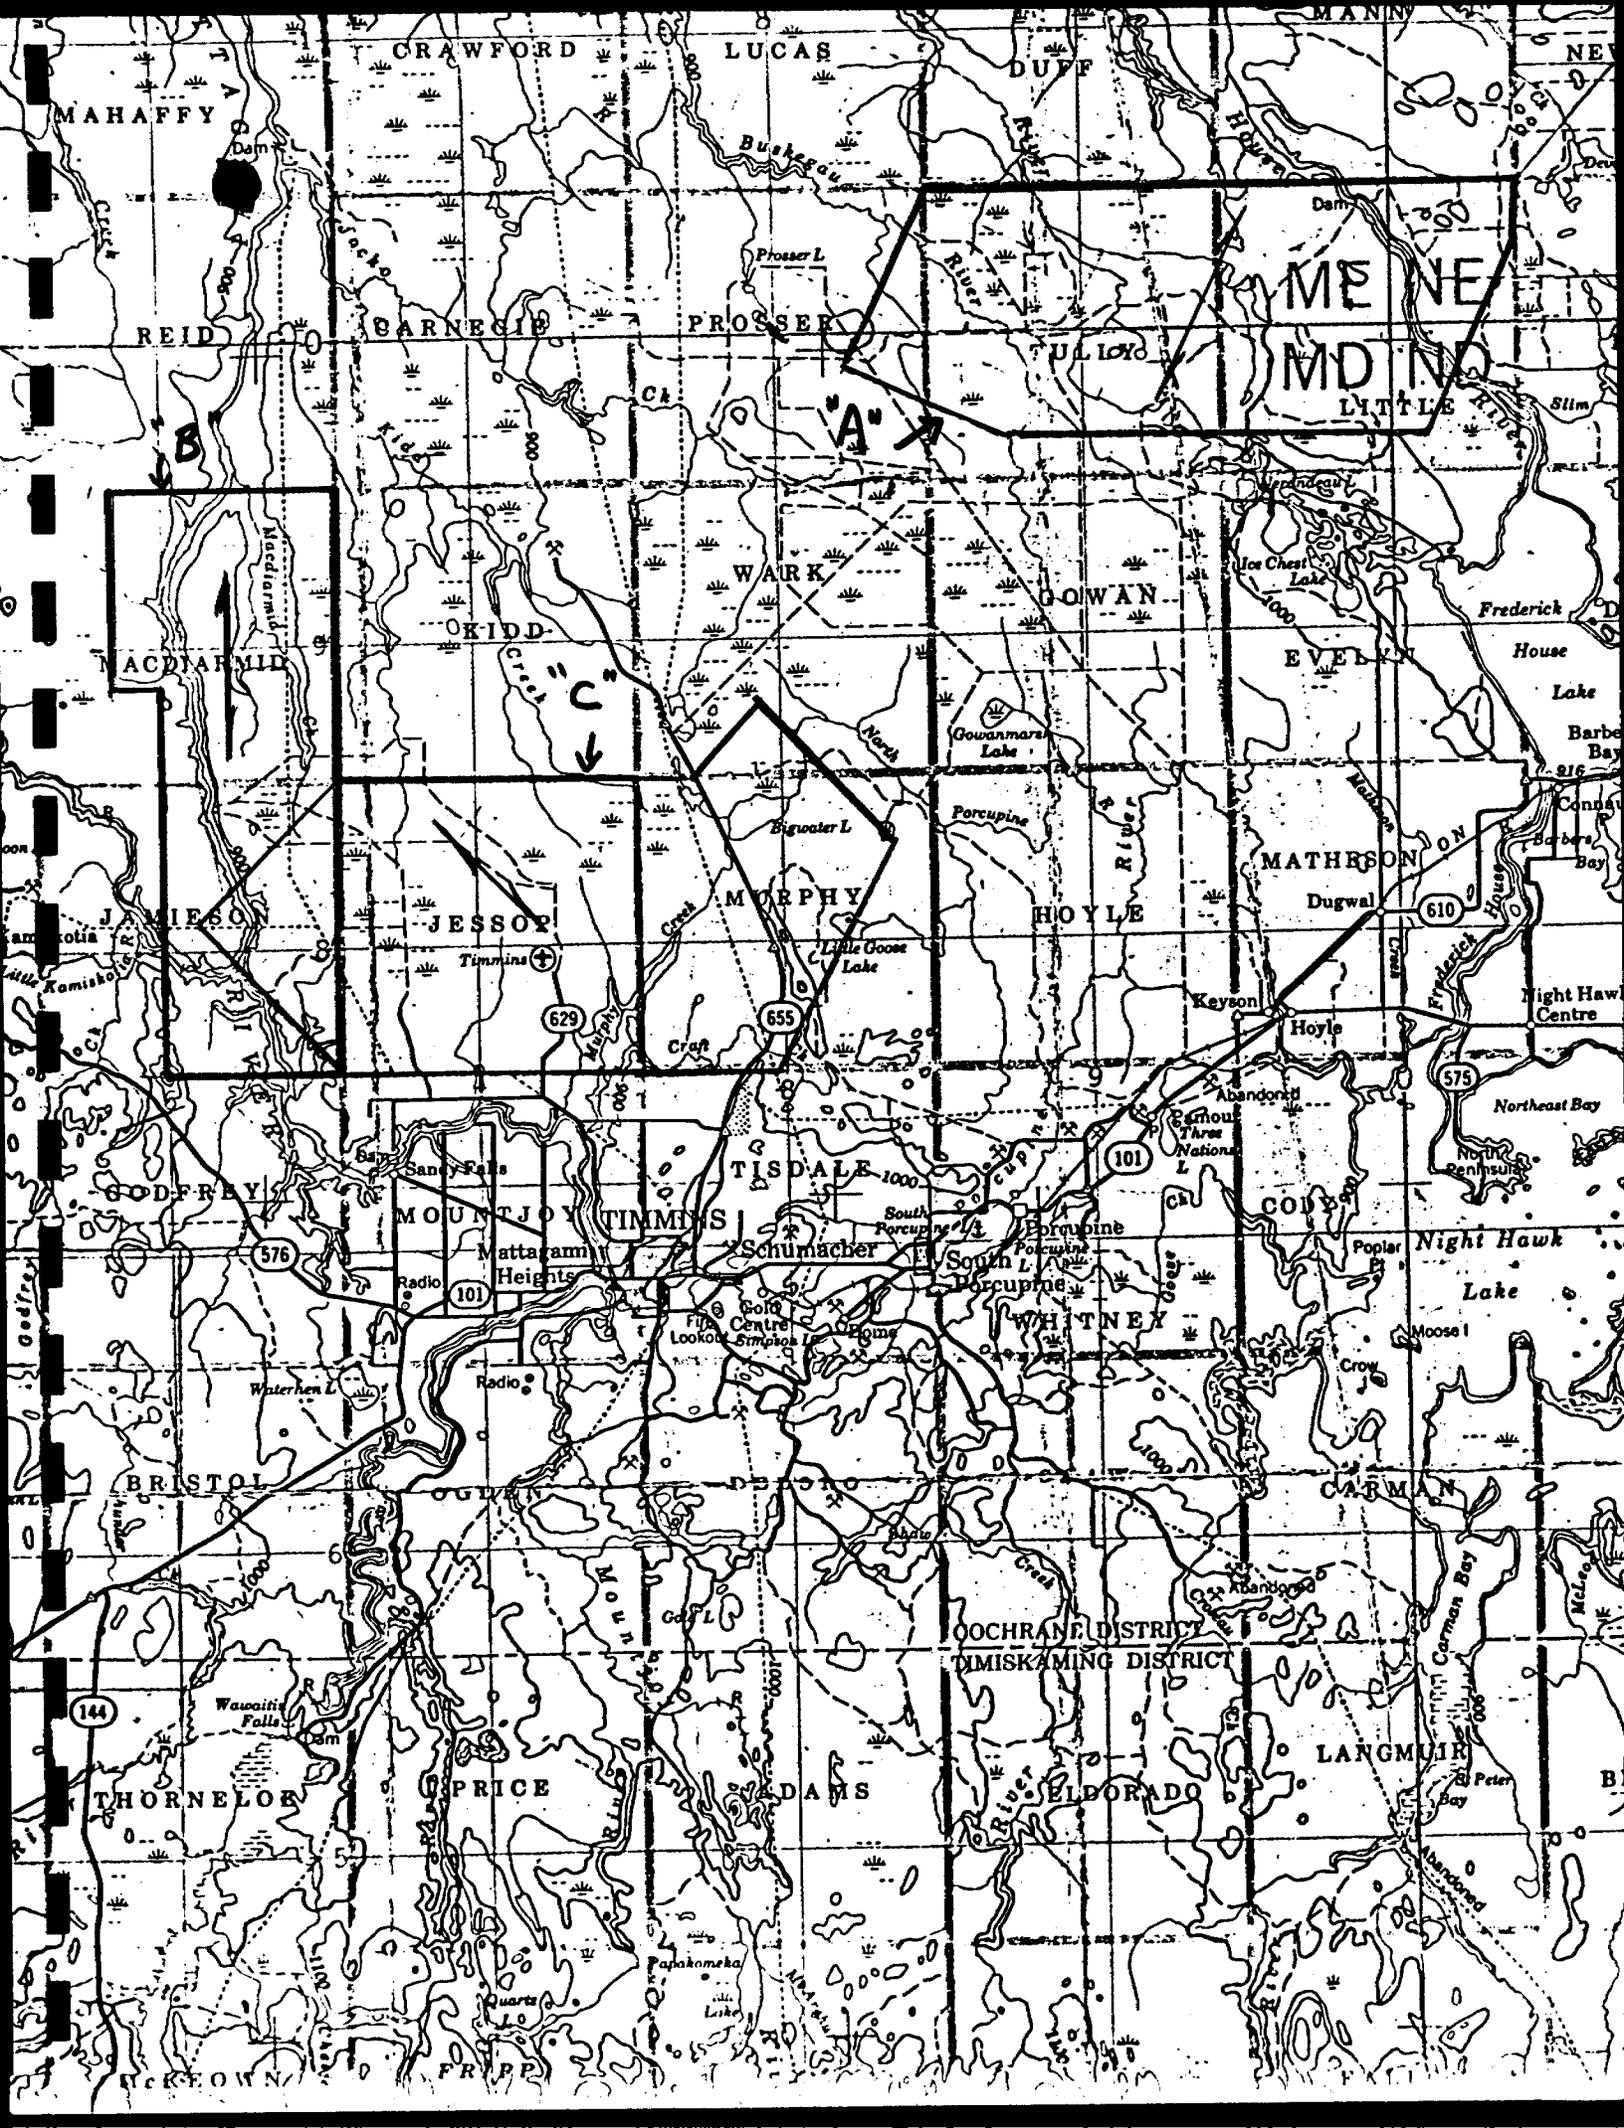

This portion of the magnetic survey is comprised of Jessop Township, Murphy Township and a portion of Jamieson Township. It is an area which has seen a considerable amount of exploration from prospecting to diamond drilling. From the enormous amount of information gained from the drilling, some meaningful understanding of the geology can be made of this area. Extensive overburden in the survey area has made it impossible to determine a complete geological picture. The magnetics, therefore, can be used to interpret the geology and structure beneath the Pleistocene cover. The moderate intensity magnetic highs in the eastern part of Jamieson Township near the Mattagami River is due to magnetite within an ultrabasic rock type. Another area of similar magnetic intensity is in the southwest corner of Murphy Township. Here the rock type has been described as being gabbro. It is quite possible that sulphide iron formation is the cause of the northeast striking magnetic trend in the northwest corner of Jessop Township. Pyrrhotite is the probable cause of the magnetics in this area. Mafic volcanics appear to be the host rocks which are the cause of the subtle magnetic features in most of Jessop Township. There are some areas in Jamieson Township which have the same features. The long north-south striking features in Jamieson Township are related to diabase dykes. There is

also what appears to be a diabase dyke striking north-northeast in the west central part of Jessop Township. Most of the area east of the Timmins airport appears to be void of any diabase dykes. The magnetic lows within BLOCK C can be related to felsic volcanics and in some cases, metasediments.
