## ADDENDUM TO REPORT ON ROSEVAL SILICA INC. - TIONAGA QUARTZ RESERVES

## July 10, 1989

The following report gives a brief description of the recent stripping at site #3 and 2(a) as shown on the attached maps #1 and #2.

#### SITE #3

いまたあたい かんちい ちかい とうし して 戸村 たいいちかいちょうい かって 市場をして

niñ is

語を要わり

At site #3, six days of slashing and stripping was undertaken by the contractor Claude Caron of Timmins. Two equipment operators using a small bulldozer and a trackhoe along with a slasher were assigned to this operation.

Stripping was initiated near hole A3 and progessed northward until the quartz bedrock started dipping below about 7' of overburden, stripping was halted here despite the lack of a contact. Continuing stripping to the south and southeast revealed a contact with a greenish grey talc-ankerite phyllite containing parallel 1' - 3' wide veins of quartz. (This phyllitic rock type bore a resemblance with that encountered in the stripped area of site #1 - see assessment file information for claim #P984379, Penhorwood township.) This was the widest area stripped representing a width of quartz at least 90' wide.

Stripping continued to the east and west with more quartz being encountered in both these directions. Excessive pile up of overburden and limited time prevented more extensive stripping.

Test pits #2, 3 and 4 were dug to determine the possible extent of the quartz. Quartz with a brown surface stain was encountered in pit #2 and quartz with some waste rock was found in pit #3. In pit #4 an undetermined waste rock was encountered. Pit #1 was dug on the basis of some quartz outcrops which later proved to be loose float. No quartz appeared to be present in this pit although solid bedrock was not reached.

It should be mentioned that prior to stripping a crude survey of the area was undertaken with a prototype digital GDD Beep Mat purchased by Bedrock Consulting. This instrument was able to discriminate quartz bedrock underlain by up to 3' of overburden and was useful to indicate the area of intended stripping and helped define the nature and location of the quartz contact. Blue ribbons marking the extent of the quartz as indicated by the instrument readings matched the actual contacts and the abruptness in the change of the readings indicated the sharpness of the contact.

The apparent quality of quartz encountered was very good (suitable for the production of silicon metal). Occasional discrete inclusions of dark green to rusty coloured talc-ankerite were oberserved ranging in size from 6" x 6" to a rare maximum 1' x 10'. These inclusions seemed to be arranged along a trend parallel to the strike of the quartz body. Minor surface films of orange brown staining were frequently encountered on the surface exposures of the quartz.

Based on the maximum width stripped (90' width of quartz), the length of quartz exposed - assuming continuity to hole A6 (270' length of quartz) and the results of a drill program (60' depth of quartz), we can assume a volume of 54,000 m<sup>3</sup> or 143,000 tonnes of quartz. This is about the maximum predicted size of the body as stated in the March 12 report. As this body is still open to the north and at depth, and the termination of the east and west boundaries have not yet been located, the possibility of additional reserves are very good.

A deeper drill program with holes at 24' centres would be adequate to give drill proven tonnes of quartz over the area of quartz exposure.

#### SITE 2(a)

いたまたい

かられた アート・ション

くないである

- いうしいかったいますのあるとないないないないでものなってものなってものないますの

「「「「「「」」」」」」「「「「」」」」」」

A very limited one day stripping program was carried out on site 2(a). A report from Gaetan Lavallee indicated that quartz of unknown quality was encountered over an area  $100' \times 200' - 300'$  as determined by two trenches 5 to 6' deep at right angles to each other. It is quite possible that site 2(a) could be an extension of site 2.

If an assumption is made of a quartz depth of 45' (as indicated by the nearest set of drill holes - see March 12 Reserves report) over an area of 20,000 ft<sup>2</sup> the volume of quartz would be 32,620 m<sup>3</sup> or 86,575 tonnes. These possible reserves could be proven again by further stripping and drilling at 24' centres. These reserves would be in addition to those drill indicated reserves reported in the March 12 Reserves report. Further reserves at site 2(a) are also possible.

### CERTIFICATE

I, Robert G. Komarechka, of the City of Sudbury, in the Province of Ontario hereby certify as follows:

- 1. That I am a consulting geologist currently residing in Sudbury.
- 2. That I am a graduate, BSc. Geology major, of Laurentian University of Sudbury, Ontario, a registered professional geologist in the Province of Alberta afiliated with the Canadian Council of Professional Engineers, and that I have been practising my profession for seven years.
- 3. That I have no interest direct or indirect, and do not expect to receive any interest in the properties, or in the security of anyone or company involved with this property.
- 4. That this report is based on a personal examination of the property during stripping operations from June 26 to July 6, 1989.
