42B02NW2001 2.20399 WARREN 010

Mr. Don Hains
Purechem Limited.
517 Wellington Street W, Suite 405
Toronto, Ontario, M5V 1G1

Dear Mr. Hains:

**RE: STATISTICAL ANALYSIS OF AREA B, WARREN TOWNSHIP
ANORTHOSITE PROJECT**

Watts, Griffis and McOuat Limited ("WGM") was retained by **Purechem Limited** ("Purechem") to carry out a preliminary statistical analysis of percussion drilling samples from one test area of its anorthosite deposit located in Warren Township, Ontario. We understand that Purechem wishes to use the results of this study to better quantify the chemical characteristics of the deposit in order to determine if the potentially mined product would meet the chemical specifications required by the glass industry.

The following letter report outlines the assumptions that WGM has made, the data used in our analysis and our conclusions and recommendations.

Data Used in Statistical Analysis

Raw geochemical data was provided to WGM by Purechem in the form of a series of excel spreadsheets. WGM was not present during the drilling, sample preparation or analysis of any of the samples and therefore is not in a position to ensure their validity or accuracy.

Chemical analysis of the samples was done by ICP lithium metaborate fusion. Some duplicate ICP and XRF analyses were also completed for certain samples. Variability of the duplicate analysis was within industry standards. A more detailed review of possible bias variations as a result of analytical methods should be undertaken prior to production, as chemical specifications of the final product fall in a narrow range.

In completing our statistical analysis, WGM has used only the percussion drilling results from drillholes 1 to 11. These holes outline what has been termed "Area B" in this report and this area is believed to represent the potential initial production. We reviewed the chemical results of other drilling completed in the anorthosite body to assist in some of our conclusions.

20399

Purechem Limited.

February 8, 2000

Two cross sections showing the drill holes and analytical results can be found in Appendix 1. A complete list of the ICP result for holes 1 to 11 appears in Appendix 2.

In order to ensure an un-biased statistical analysis, additional samples contained within Area B such as surface grab samples were not used as these samples, a) are of a much smaller "size of support" relative to the drilling, and b) tend to be taken in order to measure small unique geological features and therefore often display a conditional bias.

Preliminary Statistics and Observations

Table 1 summarizes the statistical analysis of the major compounds from the 50 raw samples taken from drillholes 1 to 11. In all but three cases, samples are 3.03 m in length.

TABLE 1
STATISTICS ON TOTAL OF APPROXIMATELY 3.03 M DRILLHOLE SAMPLES (HOLES 1 TO 11)

Statistics	SiO ₂	Al ₂ O ₃	Fe ₂ O ₃	CaO	MgO	Na ₂ O	K ₂ O	TiO ₂	MnO	P ₂ O ₅

A further analysis of the data identified two samples at the bottom of hole DH5 that are clearly anomalous with respect to the other samples within Area B but also to the drilling results from other areas on the anorthosite body. These two samples (# 15969, 15970) appear to represent a different geological domain or possibly the outer edge of the anorthosite body. As these two samples are located in the outer edge of the sampling in Area B and similar results are not present in the larger data set, WGM believes that this unique material can be excluded during mining and therefore, we have removed these samples from any further statistical analysis.

Table 2 summarizes the statistical analysis of the major compounds for the raw drilling samples from holes 1 to 11 with the removal of the two samples from DH5.

Table 2 indicates that the majority of the sample variability for many of the major compounds was a direct result of the inclusion of the two anomalous samples in DH5. In WGM's opinion, these results would more accurately represent the statistical analysis of the material to be mined and sold.

Spatial Correlation of Samples

Due to the limited number of samples, a spatial correlation analysis of the sampling could not be completed using standard variograph methods. As a result an analysis of the spatial distribution of the major compounds was limited to a more intuitive review of the data.

This review indicated that there is little spatial correlation between samples once the two samples from DH-5 have been removed. As a result, the variability between samples is randomly distributed and the best estimate of the chemical characteristics of mineable material within Area B could be obtained by a weighted average of the drilling samples.

In the case of variability relative to sample depth some scatter plots were created. These did show a weak increase in SiO₂ and a weak decrease in Al₂O₃ with depth (Figures 1 and 2). It is WGM's opinion that these very weak trends would have an insignificant impact on the composition of a final product, as blending of the samples from all sample depths would occur during mining.

The other major compounds display no correlation with sample depth.

Purechem Limited.
February 8, 2000

Chemical Variability of Samples

One concern that was expressed by Purechem was that of the standard deviation value for many of the significant compounds in the sample data set and its effect on the chemistry on the final product.

It should be considered that the variability of individual samples (in this case percussion holes with a sample lengths of 3.03 m) will be greater than that of a much larger mining unit (in this case approximately 10,000 tonnes) without a resulting change to the overall mean grade. This decrease in variability, expressed as a standard deviation or coefficient of variance ("CV") with increasing sample size is termed the volume-variance effect or more commonly the "size of support".

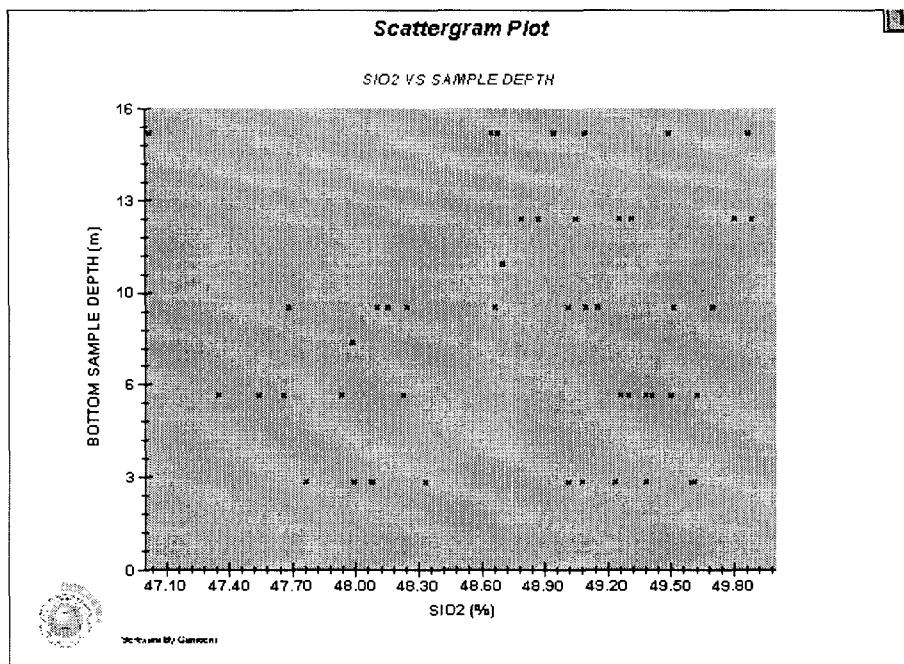

Figure 1. SiO₂ vs Sample Depth

Purechem Limited.
February 8, 2000

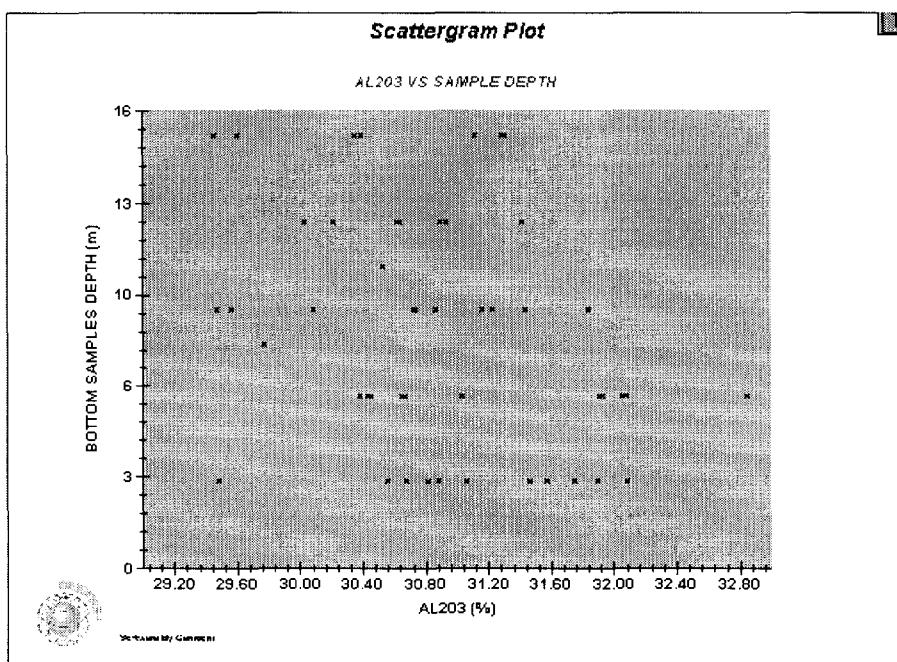

Figure 2. Al_2O_3 vs Sample Depth

To demonstrate this, the raw samples from Hole 1 to 11 were composited so that the chemistry of each hole is represented as one sample. The summary statistics for the composite samples is outlined in Table 3.

Increasing the sample size by approximately 3 to 4 times results in a significant decrease in the summary Standard Deviation and CV for each compound with only very minor change to the mean value for each compound. Further decreases in variability will result as the deposit is mined in 10,000 tonne unit with little change to the mean of such mining blocks.

Conclusions

Based on our preliminary statistical analysis, WGM concludes the following:

- Two samples from the bottom of hole DH-5 are clearly anomalous relative to the rest of the sample population and therefore were not considered in the statistical analysis as they will not be included in the final product.
- Given the random distribution of variability between samples, a order of magnitude estimate of the overall mean grade of a final product could be obtained from the mean chemical analysis of the samples in Area B.
- From the available data, the mean compound values outlined in Table 3 should provide the most reasonable estimate of the chemical composition of the potentially mineable material in Area B. This estimate assumes that these drillholes are un-biased in terms of drillhole location what parts of Area B. WGM cannot confirm this un-bias at this time.
- A more detailed review of possible bias variation as a result of analytical methods should be undertaken prior to production.
- The variability of each compound within the standard mining unit will be less than that of the smaller samples within that mining unit as a result of the size of support effect.

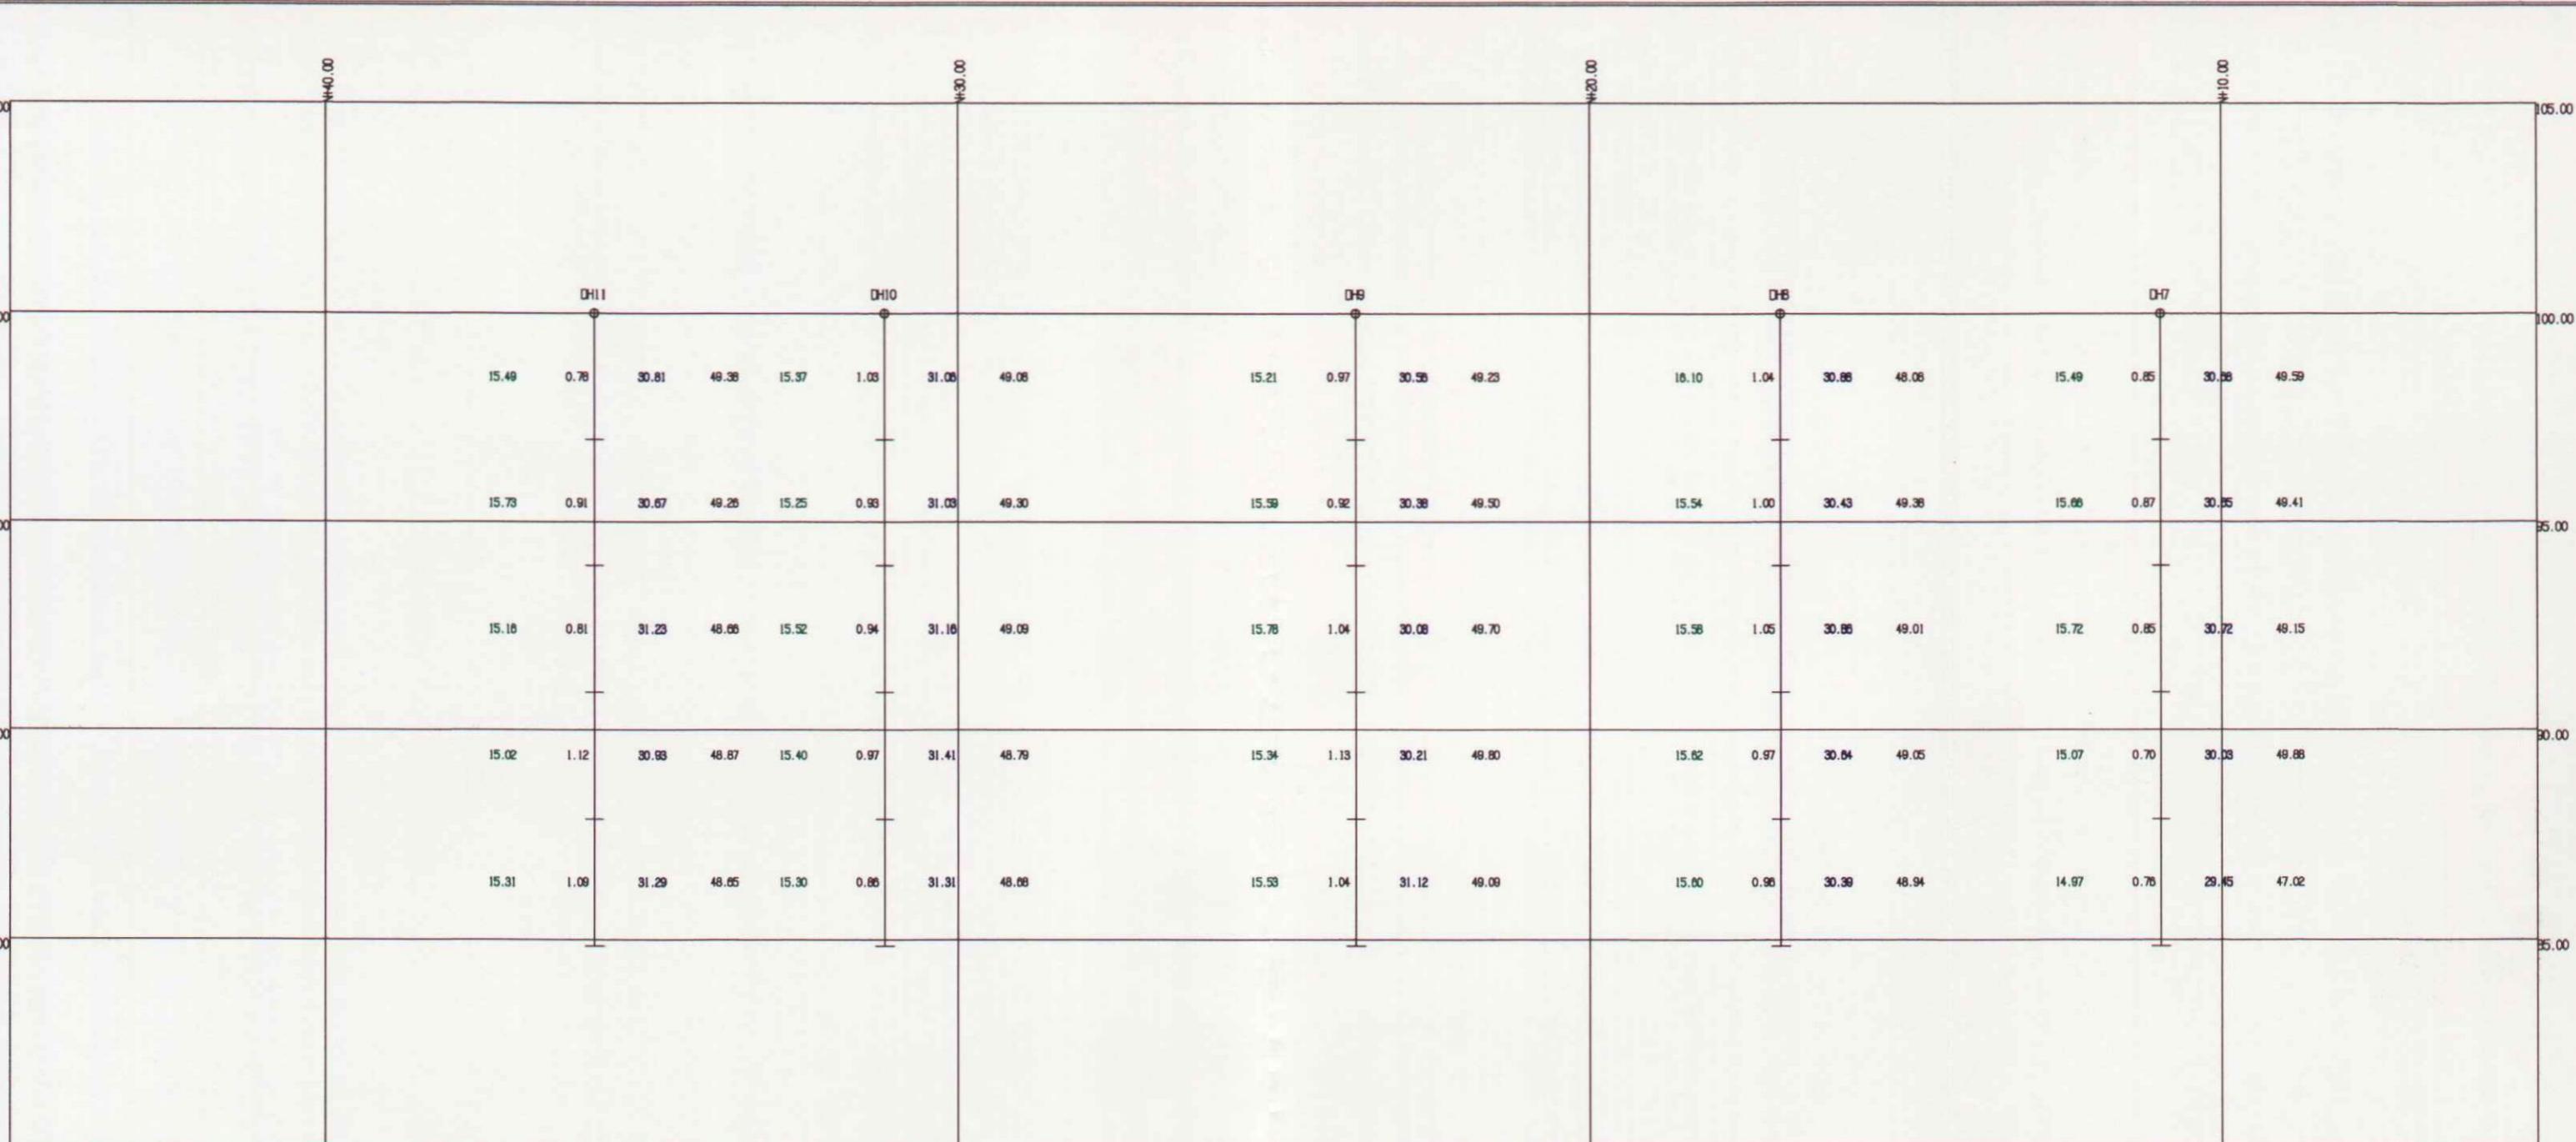

Very best regards,

WATTS, GRIFFIS AND McOUAT LIMITED

Per: Dan Redmond
Geologist

Re: Project 8901-238 FEB5008.R00 – Whole Rock Analyses

Dear Don:

Please find attached the certificates of analysis for whole rock analyses on several products relating to your anorthosite project.

These include:

- Anorthosite +200 mesh Para Non-Mag (product following magnetic separation and prior to final grinding)
- Anorthosite NMag -200 mesh (final ground product which you returned to me for analysis), and
- one feed sample and eight test products sent to me by Ronald Gehauf of Inprosys.

I hope that your project is progressing well, and I look forward to hearing about it at the PDA. Best regards,

Nichola McKay

RE: Fractionation Test Results

Page 1 of 2
Date March 7, 2000
Fax# 416-591-7942
Ref# 00-1191

Dear Don,

I plotted the Fe₂O₃ analyses you sent on the accompanying Grade-Recovery chart. I have found some numbers that do not appear to be consistent. We normally see a diminishing reduction of the iron content as the Non-Magnetic mass recovery decreases. While the overall trend is as expected, you can see that several points do not follow. Most notably, in Test 1, the NMag 5 product is higher than the NMag 4 product.

In Test 2, the NMag 2 and NMag 4 products show little reduction from the previous stage while the mass reduction is significant. I would also expect the iron level of the final product from Test 1 to be lower than that from Test 2 because of the lower feed rate in Test 1.

The magnet configuration, belt thickness and roll speeds are adjusted here to provide diagnostic information about the response of your material. The combination used for Stages 4 and 5 provide the highest strength/highest yield for the tests.

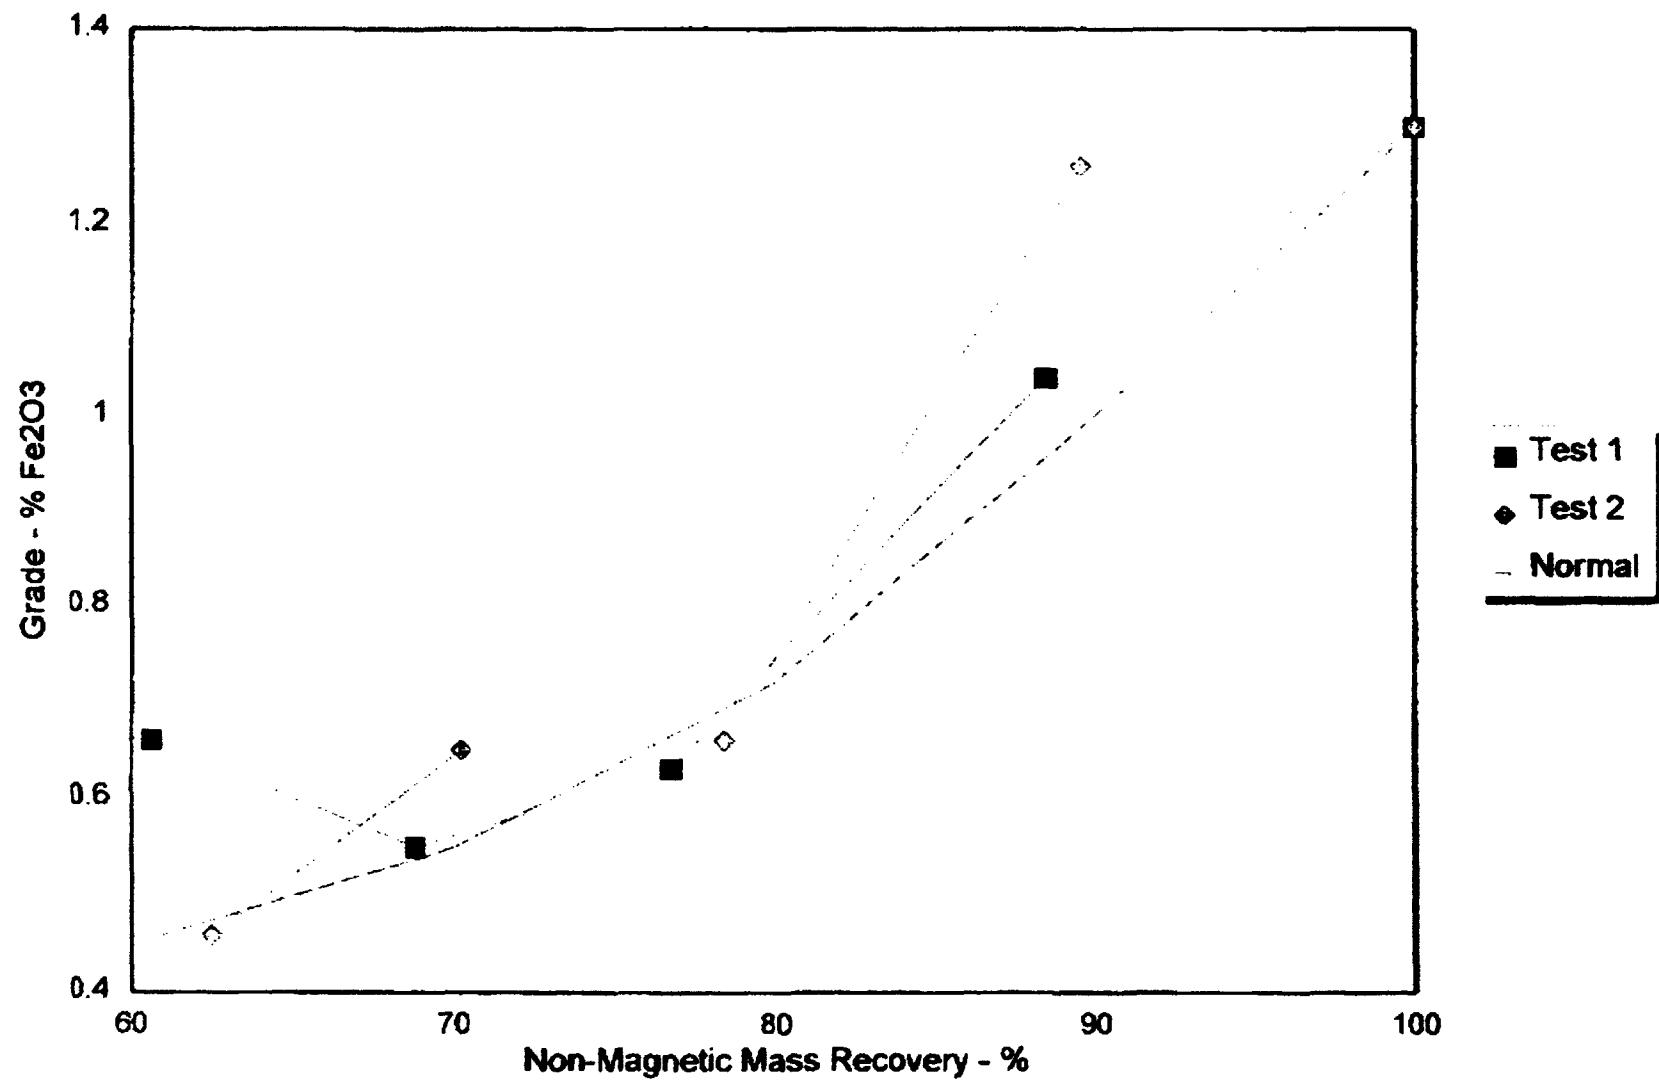

Your suggestion of a finer grind seems appropriate if the problem is mineral liberation. However, you will find that there will be more losses of the extremely fine particles. I would be happy to conduct some additional tests if you provide the finer sample. We could then compare the Grade-Recovery curves based on grind as well.

Best regards,

Ronald Gehauf
Technical Services Manager

Dear Mr. Hains,

We received a sample of your anorthosite for magnetic separation testing using our High-Force® magnetic separator. The sample may be identified as INPROSYS No. 00-019.

Introduction

The High-Force® magnetic separator was developed to take advantage of the most recent advances in rare-earth magnet technology and many years of industrial experience. The design objectives were to optimize the magnetic force taking into consideration the needs for each individual application, reduce or eliminate the problem with short belt life and incorporate a more efficient dust control system.

The standard High-Force® rolls are either the highest strength 300 mm (12 in.) or 100 mm (4 in.) diameter magnetic roll. The rolls have various ratios between the magnet disk and the steel disk thicknesses which determine the roll strength and optimum performance relative to the particle size. Medium-strength rolls of 100 mm (4 in.) diameter are also available. They are intended primarily for removal of (scalping) or concentrating strongly magnetic and ferromagnetic materials.

Scope

Fractionation tests were conducted so that Grade-Recovery curves could be constructed at different machine capacities. The total throughput was expected to be 6.5 tph. Tests were conducted to also determine the machine capacity.

Procedure

Using a riffle splitter, the entire material was split into two equal and representative portions. One half was again split into two portions and repeated until a suitable size and number of samples was obtained. Each sample was placed into a new plastic bag and sealed for storage until it was needed for testing.

In conducting these tests, the material was fed onto the belt with a vibrating feeder. The belt carried the material across the magnetic roll, producing Mag 1 and Non-Mag 1 products. The Non-Mag 1 product was again fed onto the belt producing Mag 2 and Non-Mag 2 products, etc. The feed rate of pass 2, etc., was adjusted to simulate a cascading production machine. As the roll speed was reduced, the less magnetically responsive minerals were recovered in the magnetic product. The feed rates are reported as metric tonnes per hour per meter (tph/m) of processing magnetic roll. Our standard machines are 1.0 and 1.5 meter wide but we also manufacture 0.5 meter wide machines.

With fine material and certain minerals, static charges cause the particles to agglomerate and stick to the belt. This interferes with the movement of magnetic particles to the collection sites and causes non-magnetic material to report in the magnetic product. An ion generator (ionizer) was used to place a layer of ions on the belt surface and filter through the material as it fed onto the belt. This helped to dissipate the static charges and allowed better separation of the fine particles.

Discussion

Initial investigations indicated that half or more of the material would respond as magnetic material. Since an ultra-clean product is not required and there is an economic cut-off in recovery, fractionation tests were conducted. A fractionation test involves reprocessing the non-magnetic product in a series of passes where the net magnetic field strength is increased on each pass.

Two tests were conducted at 2.2 and 3.3 tph/m. These tests are equivalent to processing the intended capacity with two 1.5 meter or 1.0 meter machines respectively. A sample of each NMag 2, NMag 3, etc. product was split out so that the products could be analyzed directly. The removal of this material from the total was compensated for in the material balances.

Conclusions

Five passes were made with each feed rate. A total of almost 40 mass percent was separated as magnetic product. Generally, the ionizer has little effect when the roll speeds are over 200 rpm. However, this material appears to have a very high static charge associated with it. The ionizer appeared to reduce the amount of fine material reporting to the magnetic products.

These tests are only preliminary. The machine settings have not been optimized. Based on the analytical results of these products, we can determine in which direction to proceed. All of the

test products are being forwarded to Ms. Nicki McKay at Lakefield for analysis. Please inform us of the results of their analyses. The material balances for these tests are attached to this report. The remainder of your sample will be retained for approximately one year in the event additional tests are warranted.

If you have any questions, feel free to contact me.

Best regards,

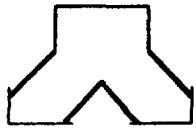

Ronald Gehauf
Technical Services Manager

Dear Ms. McKay,

Mr. Don Hains of Purechem asked that I forward the enclosed samples to you for XRF fusion analysis. The samples are products from magnetic separation tests I conducted on his anorthosite project (LR 9903081). Our identification number is 00-019.

Please find enclosed the following nine samples for analysis:

00-019	Head Feed	
	1-NMag 2	2.NMag-2
	1-NMag 3	2-NMag 3
	1-NMag 4	2-NMag 4
	1-NMag 5	2-NMag 5

Enclosed are the following ten magnetic products for reference. Please contact Mr. Hains to see if he wishes to analyze these.

00-019	1-Mag 1	2-Mag 1
	1-Mag 2	2-Mag 2
	1-Mag 3	2-Mag 3
	1-Mag 4	2-Mag 4
	1-Mag 5	2-Mag 5

Please forward the attached report to Frédérique Vincent. If you have any questions, please feel free to contact me or Mr. Hains.

Best regards,

Ronald Gehauf

Petrographic Examination of a Coarse-Grained Anorthosite

submitted by

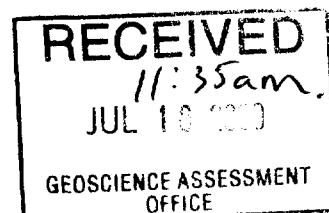

~~Pro Chem~~
~~PURE CHEM~~

2.20399

Project Managed by: Nichola McKay, M.Sc., Sr. Mineralogist

Report Date: December 23, 1999

Project No.: 8901-238 / NOV5010.R99

Note

This report refers to the samples as received. The practice of this Company in issuing reports of this nature is to require the recipient not to publish the report or any part thereof without the written consent of Lakefield Research Limited.

Neither Lakefield Research Limited, nor its subcontractors, consultants, agents, officers, or employees shall be held responsible for any loss or damage resulting directly or indirectly from any default, negligence, error or omission. The liability of Lakefield Research Limited, if any, shall be limited in total to the invoiced value of this project.

Petrographic Examination of a Coarse-Grained Anorthosite

Summary Report

Introduction

One rock sample, identified as “Anorthosite”, was submitted for mineralogical characterization and customized dry crushing-grinding and magnetic separation. The sample was delivered and the testing requested by Mr. Don Hains of Hains Technology Associates, on behalf of Pro Chem. The objectives of the testing were 1) identification of mineral assemblage, particularly the deportment of iron; and 2) preparation of a relatively pure feldspar concentrate (<0.5% Fe₂O₃) dry ground to passing 270 mesh (53 µm).

Procedures

The rock was washed to remove small amounts of soil from the outer surface. Mineral scale was removed from a prominent fracture plane using a rock saw.

One polished thin section was prepared from a representative site on the rock sample. The section was examined using transmitted and reflected light microscopy. A portion of the sample was pulverized and subjected to whole rock analysis by XRF.

The remainder of the sample was jaw crushed and then dry ground in a ball mill (steel ball charge) to nominal passing 65 mesh (200 µm). The ground material was screened at 200 mesh; the plus 200 mesh (75µm) material was subjected to a two-stage dry magnetic separation using the INPROSYS belt magnetic separator. A primary ferromagnetic separation (5000 gauss magnet) and a secondary paramagnetic separation (14,000 gauss magnet) were performed. The final non-magnetic fraction was analyzed to determine iron content, and then dry ground using a pebble mill (ceramic charge) to nominal passing 270 mesh (53 µm). Dry brightness and size analysis was performed on the final ground product.

Results

Details of the petrographic analysis are presented in Appendix 1. The Anorthosite sample was characterized by a coarse-grained, holocrystalline intergrowth of calcic plagioclase feldspar. Minor amounts of amphibole, pyroxene, chlorite and calcite were present as interstitial grains up to 1 mm in diameter. Trace amounts of sericitic alteration of plagioclase were noted along fracture planes. Delicate acicular inclusions of pyroxene and amphibole, as well as minute inclusions of rutile (<2 µm) within the plagioclase grains were the only deleterious minerals identified. A mineral balance, based on petrographic and whole rock analyses is presented in Table 1:

Table 1: Mineral Balance

Mineral SQ-XRD	Anorthosite	
	% Dist.	
Bytownite	95.5	
Mg Hornblende	2.0	
Calcite	1.1	
Mica	0.5	
Augite	0.5	
Quartz	0.2	
Chlorite	<0.2	
Fe oxyhydroxides	<0.2	
Rutile	<0.2	
Total	100.0	
Oxide (XRF)	WRA Calc.%	WRA %
TiO ₂	0.06	0.05
Fe ₂ O ₃		1.05
Fe ^T	0.36	0.74
Al ₂ O ₃	30.93	32.5
CaO	15.60	16.3
MgO	0.39	0.27
Na ₂ O	2.48	2.36
K ₂ O	0.21	0.05
P ₂ O ₅	0.00	0.01
MnO	0.00	0.01
SiO ₂	48.46	47.0
Cr ₂ O ₃	0.00	0.02
LOI	0.68	0.53
Total	99.16	100.13

Details of the magnetic separation are presented in Appendix 2. Whole rock analyses (feed and ground non-magnetic fraction), size classification (after primary and secondary grinding) and dry brightness of the final product are presented in Appendix 3. The final ground product (non magnetic fraction) reported an iron content of 0.41% Fe₂O₃ and dry brightness of 76.5%. Weight distribution of the test products is presented in Table 2.

Table 2: Weight Distribution of Anorthosite Test Products

Appendix 1

Petrographic Analysis

	Anorthosite				
Chemistry	47.0% SiO ₂	32.5% Al ₂ O ₃	16.3% CaO	2.36% Na ₂ O	1.05% Fe ₂ O ₃
Microscopy	Wt. %				PTS 6108
	95-98	Plagioclase Feldspar (bytownite). Coarse-grained (0.5 - 3 mm), equidimensional intergrowth. Well developed albite and pericline twinning. Clean with only trace amounts of sericitic alteration. Contains trace amounts of delicate, acicular pyroxene and amphibole inclusions. Also contains trace amounts of rutile inclusions.			
	1-2	Amphibole (hornblende). Disseminated, anhedral, interstitial grains up to 1 mm. May contain trace amounts of Fe oxyhydroxide inclusions. Also as delicate, acicular inclusions in plagioclase - 20-500 µm in length x 10 µm in width.			
	1-2	Calcite. Anhedral interstitial grains up to 500 µm.			
	0.5	Pyroxene (augite). Anhedral interstitial grains up to 800 µm, commonly associated with the amphibole. Also as delicate acicular inclusions in plagioclase - 20-500 µm in length x 10 µm in width.			
	0.5	Mica (sericite). Alteration of feldspar focused along fracture planes.			
	<0.5	Chlorite. Radiating, flake-like crystals associated with interstitial amphibole.			
	<0.5	Quartz. Rare inclusions in amphibole, typically <30 µm.			
	<0.5	Fe Oxyhydroxides. Rare pod-like replacements associated with interstitial amphibole. Typically <30 µm.			
	<0.5	Rutile. Disseminated inclusions in plagioclase, typically <2 µm.			
Comments	A coarse-grained, holocrystalline, equidimensional intergrowth of calcic plagioclase feldspar. Light grey in colour. Amphibole and pyroxene are predominantly present as interstitial grains. Fe is predominantly hosted by amphibole, with lesser amounts as pyroxene and chlorite, and trace amounts as Fe oxyhydroxides. Delicate, acicular inclusions of amphibole and pyroxene, and minute inclusions of rutile in the plagioclase grains will provide the only deleterious mineral constituents.				
Classification	Anorthosite

6. Instructions for cutting back credits that are not approved.

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- 3. Credits are to be cut back equally over all claims listed in this declaration; or
- 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.

2. Indirect Costs/Coûts indirects

** Note: When claiming Rehabilitation work Indirect costs are not allowable as assessment work.

Pour le remboursement des travaux de réhabilitation, les coûts indirects ne sont pas admissibles en tant que travaux d'évaluation.

Type	Description	Amount Montant	Totals Total global
Transportation Transport	Type FUEL - CAR	267.16	
			267.16
Food and Lodging Nourriture et hébergement	FOLEYET, CHAPEAU, ORILLIA, 3 NIGHTS 14 HRS	258.53	258.53
Mobilization and Demobilization Mobilisation et démobilisation			
Sub Total of Indirect Costs Total partie des coûts indirects			526.69
Amount Allowable (not greater than 20% of Direct Costs) Montant admissible (n'excédant pas 20 % des coûts directs)			526.69
Total Value of Assessment Credit (Total of Direct and Allowable Indirect costs)	Valeur totale du crédit d'évaluation (Total des coûts directs et indirects admissibles)		9447.58

Note : Le titulaire enregistré sera tenu de vérifier les dépenses demandées dans le présent état des coûts dans les 30 jours suivant une demande à cet effet. Si la vérification n'est pas effectuée, le ministre peut rejeter tout ou une partie des travaux d'évaluation présentés.

Filing Discounts

- Work filed within two years of completion is claimed at 100% of the above Total Value of Assessment Credit.
- Work filed three, four or five years after completion is claimed at 50% of the above Total Value of Assessment Credit. See calculations below:

Total Value of Assessment Credit	Total Assessment Claimed
$\times 0.50 =$	JUL 18
RECEIVED	
GEOSCIENCE ASSESSMENT OFFICE	

Certification Verifying Statement of Costs

I hereby certify:
that the amounts shown are as accurate as possible and these costs were incurred while conducting assessment work on the lands shown on the accompanying Report of Work form.

that as RECORDED HOLDER I am authorized
(Recorded Holder, Agent, Position in Company)

to make this certification

Remises pour dépôt

- Les travaux déposés dans les deux ans suivant leur achèvement sont remboursés à 100 % de la valeur totale susmentionnée du crédit d'évaluation.
- Les travaux déposés trois, quatre ou cinq ans après leur achèvement sont remboursés à 50 % de la valeur totale du crédit d'évaluation susmentionné. Voir les calculs ci-dessous.

Valeur totale du crédit d'évaluation	Evaluation totale demandée
$\times 0.50 =$	

Attestation de l'état des coûts

J'atteste par la présente :
que les montants indiqués sont le plus exact possible et que ces dépenses ont été engagées pour effectuer les travaux d'évaluation sur les terrains indiqués dans la formule de rapport de travail ci-joint.

Et qu'à titre de _____ je suis autorisé
(titulaire enregistré, représentant, poste occupé dans la compagnie)

à faire cette attestation.

Dear Sir or Madam:

Submission Number: 2.20399

Status

Subject: Transaction Number(s): W0060.00308 Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice. Allowable changes to your credit distribution can be made by contacting the Geoscience Assessment Office within this 45 Day period, otherwise assessment credit will be cut back and distributed as outlined in Section #6 of the Declaration of Assessment work form.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact BRUCE GATES by e-mail at bruce.gates@ndm.gov.on.ca or by telephone at (705) 670-5856.

Yours sincerely,
