010

SUMMARY

The current sampling program was conducted to see if there is near surface gold that could be extracted from stripped outcrops on the M-1 grid. It is a preliminary "reconnaissance" study. Channels were laid out to maximize the probability of finding gold. Consequently, where gold values are poor no further work is justified and where gold values are good further work is required.

A total of 547 samples were taken. In one outcrop area 6 contiguous samples contained an average of 5.91 grams / tonne over 3.6 metres, 3 contiguous samples contained an average of 6.96 grams / tonne over 1.8 metres, 4 contiguous samples contained an average of 14.3 grams / tonne over 2.4 metres, and 5 contiguous samples contained an average of 6.93 grams / tonne over 3.0 metres. In another outcrop area one sample contained 116 grams / tonne over 0.6 metre, 2 contiguous samples contained an average of 16.6 grams / tonne over 1.2 metres, 2 contiguous samples contained an average of 83.3 grams / tonne over 1.2 metres, and 5 contiguous samples contained an average of 32.9 grams / tonne over 3 metres.

Three outcrop areas may contain economically recoverable gold. Areas where gold values appear to be good and mining would be feasible should be carefully delineated and sampled in detail. Each channel should extend across the entire area of interest. To help remove sampling bias, channels should be evenly spaced.

INTRODUCTION

The Mishi Gold property

The Mishi Gold property is held by MacMillan Gold Corporation and is currently under option to Mishibishu Gold Corporation. It consists of 491 contiguous mining claims and 3 leased claims located in the Sault Ste. Marie Mining Division. All claims are in good standing. Work was performed on claims that lie within the Mishibishu Lake Area G-3772. A detailed list of property claims is presented in the appendices.

This report covers channel sampling performed on a portion of the M-1 grid of the Mishi Gold property between August 8 and September 8, 1997.

Location and access

The M-1 grid of the Mishi Gold property is located about 55 km west of Wawa Ontario. It can be reached from Wawa by following Highway 17 for 50 km, and a gravel road that ultimately leads to the Eagle River Mine for another 50 km (Figure 1).

Summary of exploration and development

Previous exploration of the M-1 grid has been carried out mainly by Granges Incorporated. Work has included line cutting, prospecting, magnetic and electromagnetic surveys, mapping, channel sampling, bulk sampling, and diamond drilling. Much of the work has been submitted for assessment credit.

General regional geology

The Mishi Gold property lies in the northern portion of the Mishibishu Lake greenstone belt, south of the Kabenung Lake greenstone belt and southwest of the Michipicoten greenstone belt (Figure 1) in the Wawa Subprovince of the Superior Province of the Canadian shield.

The Mishibishu Lake greenstone belt consists of volcanic rocks, related hypabyssal rocks, and sedimentary rocks that have been metamorphosed, deformed, and intruded by granitoid plutons and diabase dikes. The dikes are probably Keweenawan (Reid and Reilly, 1987). The rest of the rocks are probably Archean.

The metamorphic grade of the supracrustal rocks (the volcanic rocks, related hypabyssal rocks, and sedimentary rocks) is greenschist facies, except close to some of the felsic plutons where it is amphibolite facies (Reid and Reilly, 1987) or hornblende-hornfels facies (Bennett and Thurston, 1977). Because all of the supracrustal rocks are metamorphosed, I shall not use the prefix "meta" in naming the rocks.

2 • 1 • 2 • 6 • 3

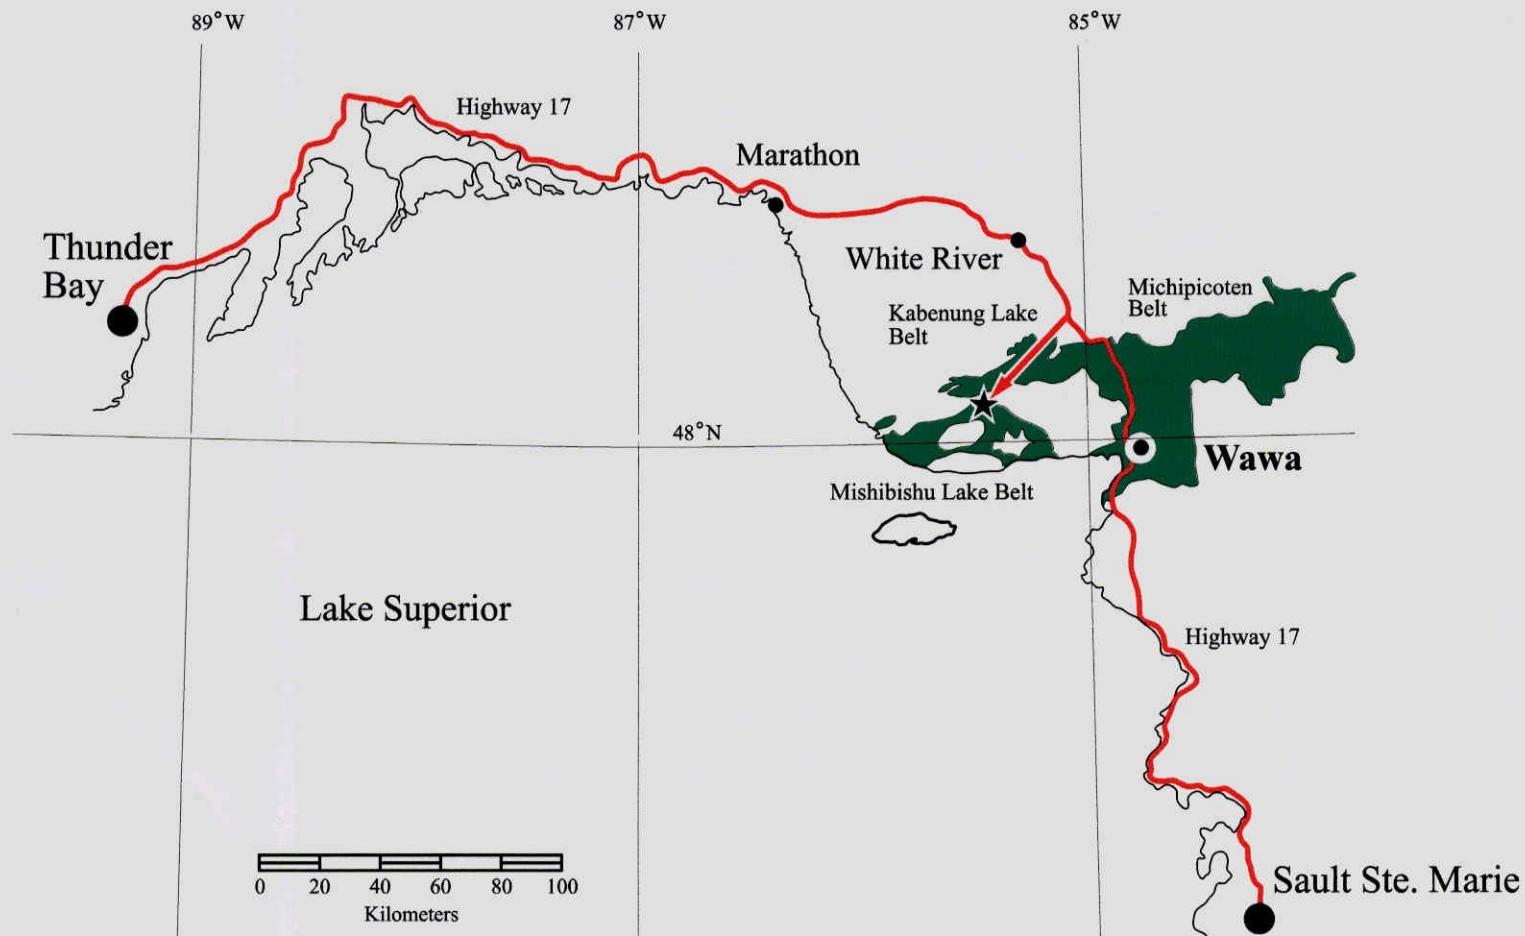

Figure 1. Location and access. The location of the Mishi Gold Property is represented by a star, and the gravel road into the M-1 grid from Highway 17 is represented by a straight arrow. After the Geological Map of Northern Ontario.

The supracrustal rocks were probably deposited adjacent to, and perhaps in part on, granitoid rocks. The overall form of the greenstone belt developed as the supracrustal rocks subsided and the surrounding and underlying granitoid rocks rose.

Bedrock is partially covered by Pleistocene deposits consisting predominantly of ground moraine, tills, and clays (Reid and Reilly, 1987).

General property geology

According to Bates and Miree (1991) the M-1 grid contains, from north to south:

- 1) mafic volcanic rocks including flows, sills, and tuffs
- 2) felsic to intermediate tuffs and hypabyssal rocks
- 3) clastic sedimentary rocks including argillite (mudstone), wacke, and conglomerate

All of the supracrustal rocks are metamorphosed, and portions of them are metasomatized (hydrothermally altered).

Except for the possible occurrence of quartz-feldspar porphyry, all of the rocks within the study area were originally pyroclastic or epiclastic. Most rocks were tuffs or mudstones, and some rocks were lapilli tuffs or conglomerates. Few of the clastic rocks look like “pristine” tuffs, or like “well-worked” mudstones or conglomerates. Where the rocks are unaltered, the primary mafic mineral is commonly amphibole. Mica is rare or absent. Compositional banding is common, but colours tend to be white or shades of green like volcanic rocks, not shades of grey or brown like sedimentary rocks. Relative to their volcanic source, the rocks are distal pyroclastic rocks or proximal epiclastic rocks.

The supracrustal rocks are cut by two sets of diabase dikes. Dikes of one set strike approximately northwest, and dikes of the other set strike approximately north-northeast.

According to Heather (1986), the Mishi Gold property is transected by a “deformation zone” that is characterized by shear zones and related structural features. Bates and Miree (1991) report that there is ductile deformation within several shear zones, and brittle-ductile deformation within a zone they call the Western Structural Zone (Figure 2). I did not see any evidence for shear zones. Structural features that are supposedly related to shear zones are related to different events. The predominant structural feature, conjugate contractual kink bands, could not be related to the proposed shear zones. Deformation is brittle-ductile throughout the study area (defined below), and the same structural features occur everywhere (see Wilson, 1997).

The study area

The study area consisted of stripped outcrop areas that I have named A to Q (Figure 3). Some of the outcrop areas were given names by geologists of Granges Incorporated: outcrop area A was known as KK; outcrop area C was known as MM; the southern portion of outcrop area D was known as Tension; outcrop area E was known as Confusion Corner; outcrop area F was known as Jake’s Place; the northern portion of

outcrop area G was known as Cliff Hanger; outcrop area H was known as White Swan; outcrop area O was known as Granges Glory; and outcrop area Q was known as Warren's Whopper.

Previous channel samples

Granges Incorporated sampled channels at outcrop areas C, D, E, F, G, H, and O. Available results for outcrop area C are shown on Map 2, available results for outcrop area D are shown on Map 3, and available results for outcrop area O are shown on Map 6. Data for outcrop area H were not available at the time of the study. Of 160 samples taken from outcrop area E, 17 contained more than 1 gram of gold / tonne of rock, 5 contained more than 2 grams / tonne, and 3 contained more than 3 grams / tonne. Of 89 samples taken from outcrop area F, 3 contained more than 1 gram / tonne. At outcrop area G, where 47 samples were taken, the only reported values are 3.997 grams / tonne over 0.5 metres, 1.44 grams / ton over 0.5 metres, and 2.194 grams / tonne over 0.5 metres.

CHANNEL SAMPLING

Objectives

In a report for Granges Incorporated, Bates and Miree (1991) noted that at outcrop area O, 'if small-scale extremely selective mining methods were effectively utilized, near surface mineralization might be extracted economically'. Assuming that the Main Zone would soon be brought into production as an open pit, the current sampling program was conducted to see if there is near surface gold that could be extracted within the study area.

Sampling procedure

Within the study area, gold is found in, and adjacent to, smoky quartz veins and pods (Bates and Miree 1991). Veins commonly occur in aggregates. Strike lengths of individual veins are generally shorter than the distances between channels. Only a few aggregates are long enough to be cut by more than one channel.

This is a preliminary "reconnaissance" study. Channels were laid out to maximize the amount of smoky quartz they transect, and thus maximize the probability of finding gold. Consequently, where gold values are poor no further work is justified and where gold values are good further work is required.

Channels were laid out by Bruce C. Wilson. Samples intervals were originally laid out at 0.3 m, but were changed to 0.6 m. Wherever possible, channels are perpendicular to the strikes of smoky quartz veins. Samples were chipped, bagged, and tagged by Joseph N. Dion, geologist (6303 - 315 Southampton Drive SW, Calgary,

Alberta, T2W 2T6). Channel sawing was supervised by Bruce C. Wilson and Joseph N. Dion. Saw cuts generally exceeded 3 centimetres in depth.

A total of 547 samples were taken: 41 at outcrop area B; 120 at outcrop area C; 11 at outcrop area D; 223 at outcrop areas H; 94 at outcrop area K; and 58 at outcrop area O.

Results

A detailed list of results is presented in the appendices.

At outcrop areas B (Map 1), D (Map 3), and K (Map 5), only a few samples contained more than 1 gram of gold / tonne of rock, and none contained more than 4 grams / tonne.

At outcrop area C (Map 2), 42 samples contained more than 1 gram / tonne, 7 samples contained more than 5 grams / tonne, and one sample contained more than 10 grams / tonne.

At outcrop area H (Map 4), 50 samples contained more than 1 gram / tonne, 20 samples contained more than 5 grams / tonne, and 11 samples contained more than 10 grams / tonne. In an aggregate of smoky quartz veins at the east end of the outcrop area: 6 contiguous samples contained 2.95, 3.81, 6.24, 14.6, 5.28, and 2.57 grams / tonne for an average of 5.91 grams / tonne over 3.6 metres; 3 contiguous samples contained 14.7, 2.23, and 3.94 grams / tonne for an average of 6.96 grams / tonne over 1.8 metres; 4 contiguous samples contained 3.77, 44.5, 3.74, and 5.25 grams / tonne for an average of 14.3 grams / tonne over 2.4 metres; and 5 contiguous samples contained 13.6, about 0.50, 2.71, 3.05, and 14.8 grams / tonne for an average of 6.93 grams / tonne over 3.0 metres.

At outcrop area O (Map 6), 20 samples contained more than 1 gram / tonne, 12 samples contained more than 5 grams / tonne, and 8 samples contained more than 10 grams / tonne. In relatively thick smoky quartz veins: one sample contained 116 grams / tonne; 2 contiguous samples contained 27.0 and 6.17 grams / tonne for an average of 16.6 grams / tonne over 1.2 metres; 2 contiguous samples contained 139 and 27.5 grams / tonne for an average of 83.3 grams / tonne over 1.2 metres; and 5 contiguous samples contained 25.3, 51.0, 64.8, 6.27, and 17.2 grams / tonne for an average of 32.9 grams / tonne over 3 metres.

Recommendations

Outcrop areas C, H, and O may contain economically recoverable gold. To determine where gold can be extracted, and how much there may be, further sampling is required.

Areas where gold values appear to be good and mining would be feasible should be carefully delineated and sampled in detail. Each channel should extend across the entire area of interest. To help remove sampling bias, channels should be evenly spaced.

Dated at Kingston, Ontario this 3rd day of October, 1997.

Bruce Wilson.

STATEMENT OF QUALIFICATION

I, Bruce Wilson, of the city of Kingston, in the province of Ontario, do hereby certify that:

1. I am a self-employed, consulting structural geologist.
2. I received an Honours B.Sc. in geology from Queen's University at Kingston, Ontario in 1974, and an M.Sc. in geology from Queen's University at Kingston, Ontario, in 1976.
3. I have practiced geology since 1976.

Dated at Kingston, Ontario this 3rd day of October, 1997.

Bruce Wilson

Fax: (416) 445-4152

CERTIFICATE OF ANALYSIS

Work Order: 017090

To: Mishibishu Gold Corp
Attn: Jim Millard
Box 87
Wawa
Ontario
P0S 1K0

Date : 25/09/97

Copy 1 to :

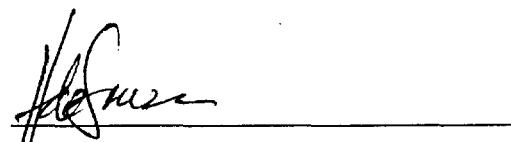

Copy 2 to :

P.O. No. :
Project No. : Mishibishu M1
No. of Samples : 64 Rocks
Date Submitted : 03/09/97
Report Comprises : Cover Sheet plus
Pages 1 to 2

Distribution of unused material:

Pulps: Pulps - no instructions
Rejects: Rejects - no instructions

Certified By :

Dr. Hugh de Souza, General Manager
XRAL Laboratories

Report Footer: L.N.R. = Listed not received I.S. = Insufficient Sample
n.a. = Not applicable -- = No result
I.N.F. = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Member of the SGS Group (Société Générale de Surveillance)

Personal information collected on this form is obtained under the authority of subsection 6(1) of the Assessment Work Regulation 6/96. Under section 8 of the Mining Act, the information is a public record. This information will be used to review the assessment work and correspond with the mining land holder. Questions about this collection should be directed to the Chief Mining Recorder, Ministry of Northern Development and Mines, 6th Floor, 933 Ramsey Lake Road, Sudbury, Ontario, P3E 6B5.

Work Type	Units of Work	Cost Per Unit of work	Total Cost
GEO TECHNICAL SURVEY	CONSULTANTS / CONTRACTORS		
CONTRACTOR	FEES / LABOUR /		\$27,009.
	REPORTING		
	APPROXIMATELY 100 PERSON		
	DAYS		
	547 CHANNEL SAMPLES		
	TAKEN		
Associated Costs (e.g. supplies, mobilization and demobilization).			
	equipment rentals and supplies		4,089
	ASSAYING		8,126.
Transportation Costs			
		OCT 23 1997 GEO SCIENCE ASSESSMENT OFFICE	1,138.
Food and Lodging Costs			
			2,439.
Total Value of Assessment Work			\$ 44,801.
		2018708	

Calculations of Filing Discounts:

1. Work filed within two years of performance is claimed at 100% of the above Total Value of Assessment Work.
2. If work is filed after two years and up to five years after performance, it can only be claimed at 50% of the Total Value of Assessment Work. If this situation applies to your claims, use the calculation below:

TOTAL VALUE OF ASSESSMENT WORK $\times 0.50 =$ **Total \$ value of worked claimed.**

Note:

- Work older than 5 years is not eligible for credit.
- A recorded holder may be required to verify expenditures claimed in this statement of costs within 45 days of a request for verification and/or correction/clarification. If verification and/or correction/clarification is not made, the Minister may reject all or part of the assessment work submitted.

Certification verifying costs:

I, JAMES E. MILLARD, do hereby certify, that the amounts shown are as accurate as may reasonably be determined and the costs were incurred while conducting assessment work on the lands indicated on the accompanying Declaration of Work form as AGENT (recorded holder, agent, or state company position with signing authority) I am authorized to make this certification.

Dear Sir or Madam:

Submission Number: 2.17768

Status

Subject: Transaction Number(s): W9750.00894 Approval After Notice

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. **WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.**

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact Lucille Jerome by e-mail at jerome12@epo.gov.on.ca or by telephone at (705) 670-5858.

Yours sincerely,

A handwritten signature in black ink that reads "Blair Kite".
