ADDENDUM

A  
REPORT  
ON  
THE  
1986 DRILLING PROGRAM  
ON  
THE  
MISHIBISHU - PUKASKWA PROPERTY  
OF  
CAPTAIN CONSOLIDATED RESOURCES LTD.

Oakville, Ontario  
August 11, 1987

J. F. White

OM 86-7-P-260

## INTRODUCTION

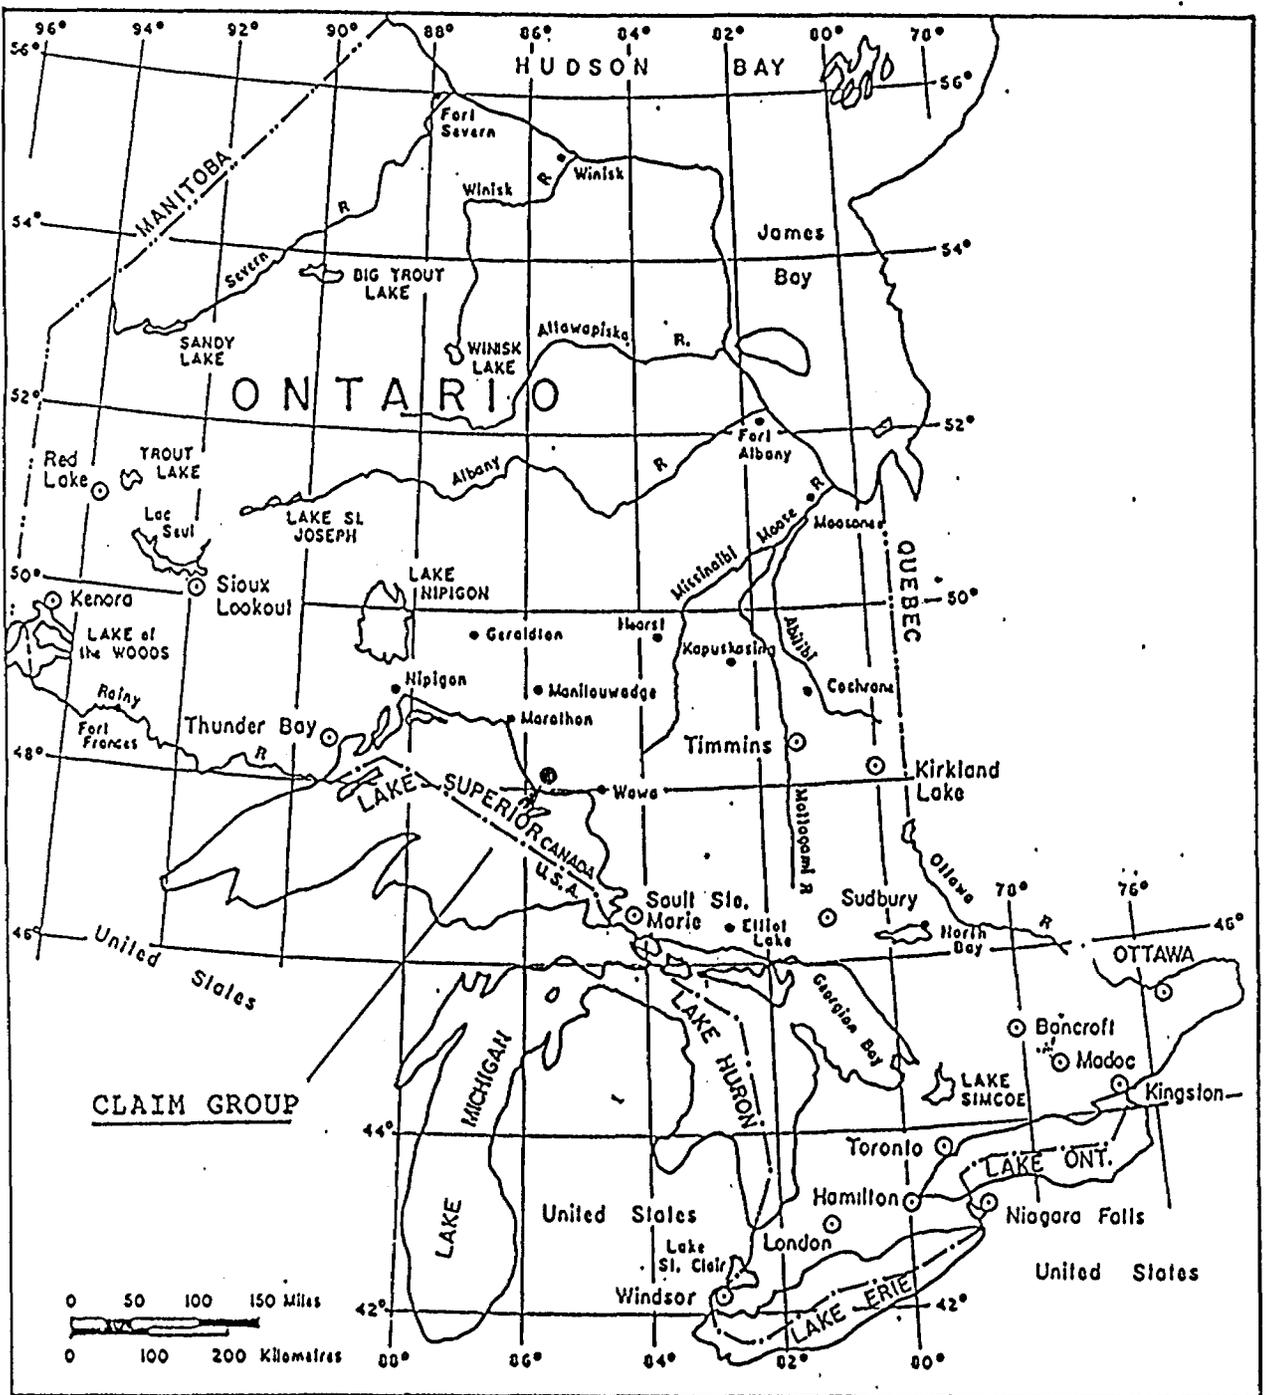

This report has been prepared as an addendum to the report entitled "Exploration Report for Captain Consolidated Resources Ltd., and Koala Resources Limited in the Mishubishi - Pukaskwa Area - Ontario" dated December 22, 1986 by Fenton Scott, P.Eng. Based on the recommendations by Mr. Scott, a series of nine drill holes were completed on the Captain Consolidated Resources Ltd. property during the period November ~~28~~ to December 6, 1986. The purpose of this report is to describe the drilling program and document the results.

## PROPERTY LOCATION AND ACCESS

The property consists of 124 contiguous mineral claims located in the Sault Ste. Marie Mining Division at  $48^{\circ}10'$  north latitude and  $84^{\circ}35'$  east longitude. Wawa, the nearest community, lies 40 miles to the east-southeast of the property. Access is by helicopter.

## HISTORY

Prior work history on the property is covered in Mr. Scott's report together with details and results of the 1986 program of line cutting and grid location, geological surveying, rock and soil sampling, and

CAPTAIN CONSOLIDATED RESOURCES LTD.

CLAIM GROUP

MISHIBISHU - PUKASKWA AREA

SAULT STE. MARIE M.D.

GENERAL LOCATION MAP

VLFEM surveying. Mr. Scott's report recommended nine drill holes to test selected geophysical targets. These holes were completed in December 1986.

#### DRILL PROGRAM

A helicopter-supported drill program was initiated on November 18, 1986. Mr. Will Brown acted as field supervisor under the direction of Mr. Terry Ryan, geologist. Canadian Longyear Limited of North Bay, Ontario was the drill contractor. The work was done using a J.K.S. 300 diamond drill. Drill core was stored in boxes at the drill camp. Split core samples were taken of all sulphide zones and quartz veins and run for gold. The drilling was filed for assessment credit with the Ontario Ministry of Natural Resources on March 26, 1987. Total footage drilled was 2307 feet. Detailed core logs are attached hereto as Appendix I. Individual hole locations are shown on the claim sketch plans also included in Appendix I.

The following is a brief description of each of the drill holes.

#### D.D. Hole No. H-1

Location: Claim No. SSM691704, Grid No. 8 Line 4+05 West, 10 metres north of baseline.

Bearing: S30<sup>0</sup>E    Dip: -45<sup>0</sup>    Length: 257'

Purpose: Test coincident anomalous rock assay and VLF conductor.

Results: Hole encountered largely mafic and cherty tuff. Conductor is attributed to pyrite and pyrrhotite concentrations at depth of 236.8' to 242.6'. No significant assays.

D.D. Hole No. H-2

Location: Claim No. SSM691665, Grid Nos. 11 and 12, 10 metres east of Line R 1 E, 135 metres north of baseline.

Bearing: S40°E Dip: -45° Length: 257'

Purpose: Test coincident anomalous rock assays and VLF conductor.

Results: Hole encountered a narrow zone of magnetite and sulphide iron formation (11 feet) at a depth of 78'. This is considered the cause of the VLF conductor. Remainder of the hole is logged essentially as mafic to intermediate tuff. No significant assays.

D.D. Hole No. H-3

Location: Claim SSM708431, Grids 11 and 12 Line R3+30E, 200 metres South.

Bearing: S30°W Dip: -45° Length 257'

Purpose: Test "gold-bearing limonite zone with coincident soil geochemical anomaly."

Results: From 17 to 37 feet split core averaged 214 ppb Au. No other assays of significance. Most of the hole encountered white biotite granite.

D.D. Hole No. H-4

Location: Claim SSM691781 Grid 17 Line C4W, 300 metres south of claim line.

Bearing: S23°W Dip: -45° Length: 267'

Purpose: Test VLFEM anomaly with coincident gold values in soil samples.

Results: Conductor caused by massive sulphide stringers at 216' - 226'. Hole encountered mafic tuff. One 5 foot core sample from 132 to 137 feet returned an original assay result of more than 10,000 ppb Au (more than 0.41 oz./ton) Initial check analyses confirmed these results but later analysis of these sample pulps and of re-sampled core returned only traces. See attached letter by F. Scott (Appendix II).

D.D. Hole No. H-5

Location: Claim SSM691790, Grids 14 and 15, Line 4+20E, 2+20N.

Bearing: S30<sup>0</sup>W Dip: -45<sup>0</sup> Length 269'

Purpose: Test coincident EM and soil anomaly.

Result: Conductor may be caused by a fault zone. Hole is mainly mafic tuff. One core sample from 162' to 167' returned an original assay of 3840 ppb Au (0.11 oz. Au/ton). Initial check analyses confirmed these results. Later analyses of these sample pulps and of re-sampled core gave only traces. See attached letter by F. Scott (Appendix II).

D.D. Hole No. H-6

Location: Claim SSM691797, Grid 13, 15 metres west of Line 9, 165 metres north of baseline.

Bearing: South Dip: -45<sup>0</sup> Length: 285'

Purpose: "Test EM target with high rock sample gold content."

Results: Conductor is attributed to sulphide accumulations as fracture fillings and stringers between 77.7' and 142.5'. No significant assays.

D.D. Hole No. H-7

Location: Claim SSM708439, Grid 20, 100 metres northeast of Line 13 at 1+00 North.

Bearing: South Dip: -45<sup>0</sup> Length: 251'

Purpose: "Test sulphide iron formation with elevated gold content in bedrock and soils."

Results: The iron formation was encountered from 67.6' to 84.6' in the hole. Balance of the hole was essentially mafic tuff and garnetiferous metasediment. No significant assays.

D.D. Hole No. H-8

Location: Claim SSM691762, Grid 16, Line 7, 90 metres south of claim line-baseline.

Bearing: South Dip:  $-45^{\circ}$  Length: 227'

Purpose: Test "coincident EM anomaly with higher gold content in bedrock."

Results: Hole encountered sulphide iron formation from 65.8' to 191.8'. Locally sulphide content is 25%. No significant assays.

D.D. Hole No. H-9

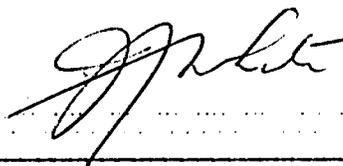

Location: Claim SSM691762, Grid 16, Line 6, 20 metres north of baseline.

Bearing: South Dip:  $-45^{\circ}$  Length: 227'

Purpose: Test coincident EM and soil anomaly.

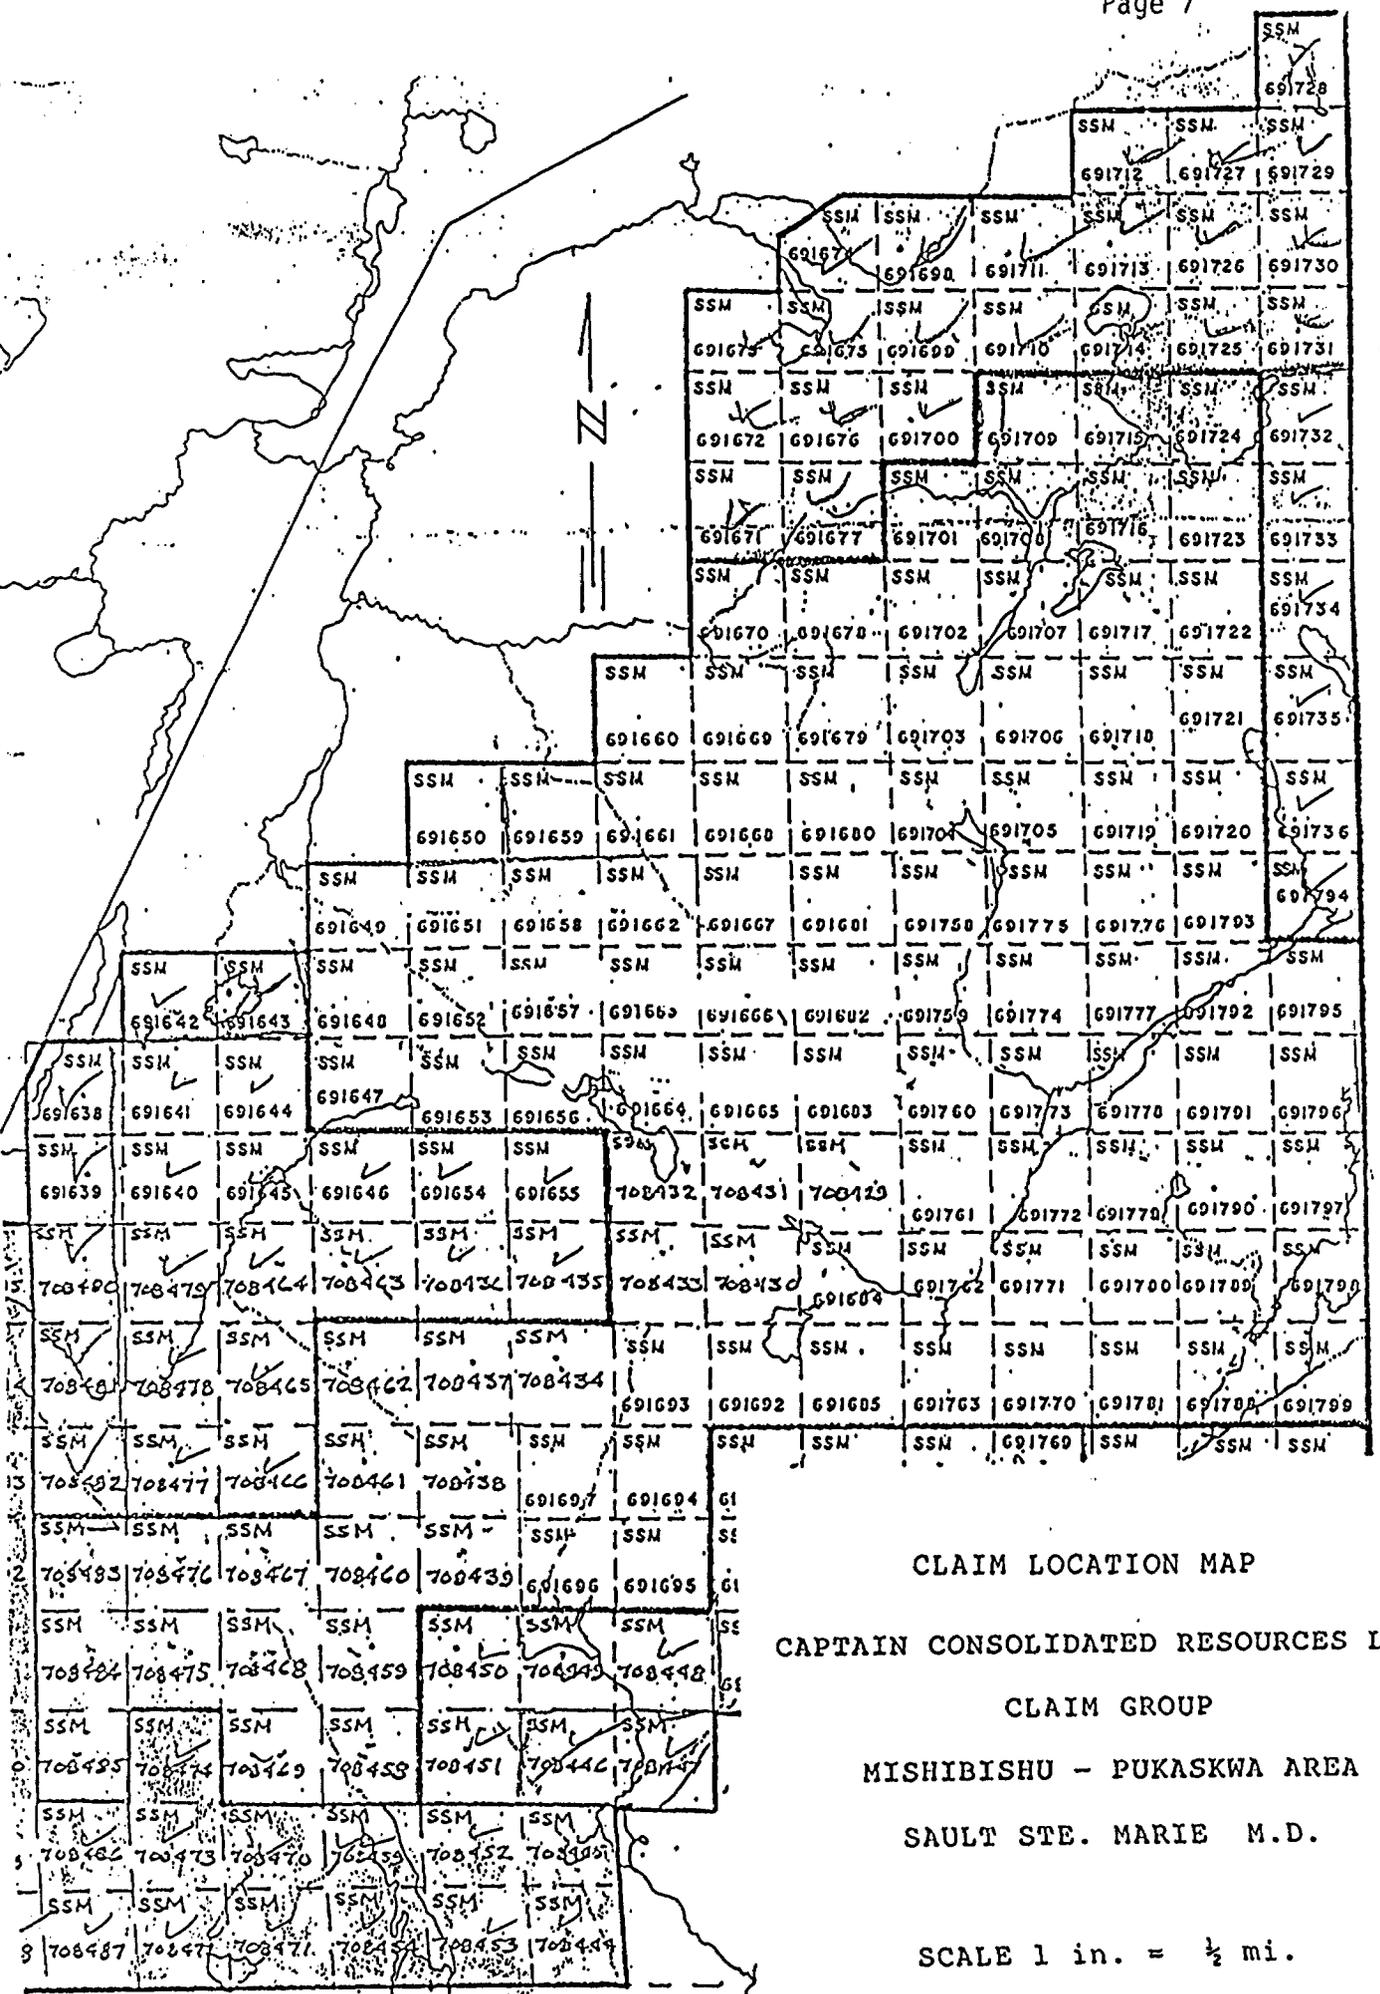

Results: Sulphide rich iron formation encountered between 105' and 111'. Top of the hole is in white biotite granite, balance is in tuff and metasediment. All assays less than 15 ppb Au.

Respectfully submitted

FENTON SCOTT MANAGEMENT  
17 Malabar Place  
Don Mills, Ontario  
M3B 1A4

August 20, 1987

Captain Consolidated Resources Ltd.  
Suite 400  
250 Dundas Street West  
Toronto, ontario  
M5T 2Z5

Gentlemen:

This letter is an attempt to describe and offer possible explanations of the analytical discrepancies on drill core from your Mishubishi Lake District Gold Prospect in Ontario.

In November and December, 1986, nine diamond drill holes were put down on the property to test geophysical indications at locations where overlying soils or adjacent bedrock showed higher than normal gold content.

A total of 334 samples were sent to Assayers (Ontario) Limited in Toronto. These split drill cores were analysed for gold content prior to January 8, 1987. Three of these samples, numbered 102, 140, and 184 were reported to show significant values.

Prior to reporting the gold assays, the laboratory re-assayed the pulps from samples 102 and 184 and obtained corroborative results. This re-assay selection included umpire assays for other customers, and one sample for Fenton Scott Management. This sample for Fenton Scott Management has been checked at another laboratory with comparable results, although numbering procedure is not clear.

As part of a property examination circa March 1987, a mining company assayed parts of the remaining split cores from the property. They reported only background gold values.

Continued.....

On receipt of this information, Captain Consolidated Resources Ltd. ordered that the relevant pulps and rejects from this core samples be re-assayed at Assayers (Ontario) Limited. In addition a number of samples were sent to D'or Val Mines Limited and Bourlamaque Assay Office for analysis. In total, 211 of the 334 samples were tested again, including all significant numbers.

All of the re-assays showed only background gold values.

In May, 1987, an extensive discussion of analytical procedures took place with personnel of Assayers (Ontario) Limited. No obvious discrepancies or errors were noted, and all standard procedures appeared to have been followed.

There are several possible explanations for the reported high values:

1. Instrumentation Failure.
2. Inadvertent "Salting" in the Laboratory.  
(The fact that check samples also ran make the above explanations unlikely).
3. Inadvertent "misnumbering" of samples at Laboratory.
4. Nugget effect where gold occurred in discrete particles in two sample runs only.

None of these explanations appears satisfactory. The fact that surface sampling showed anomalous gold values in the vicinity of the diamond drill holes makes resolution of the mystery more important.

Cordially yours,

**FENTON SCOTT MANAGEMENT**
