1.0 INTRODUCTION

Through October 1987 to February 1988 Central Crude Limited completed a program of linecutting, ground geophysics and soil sampling on the Pukaskwa River property held by Joutel Resources Limited.

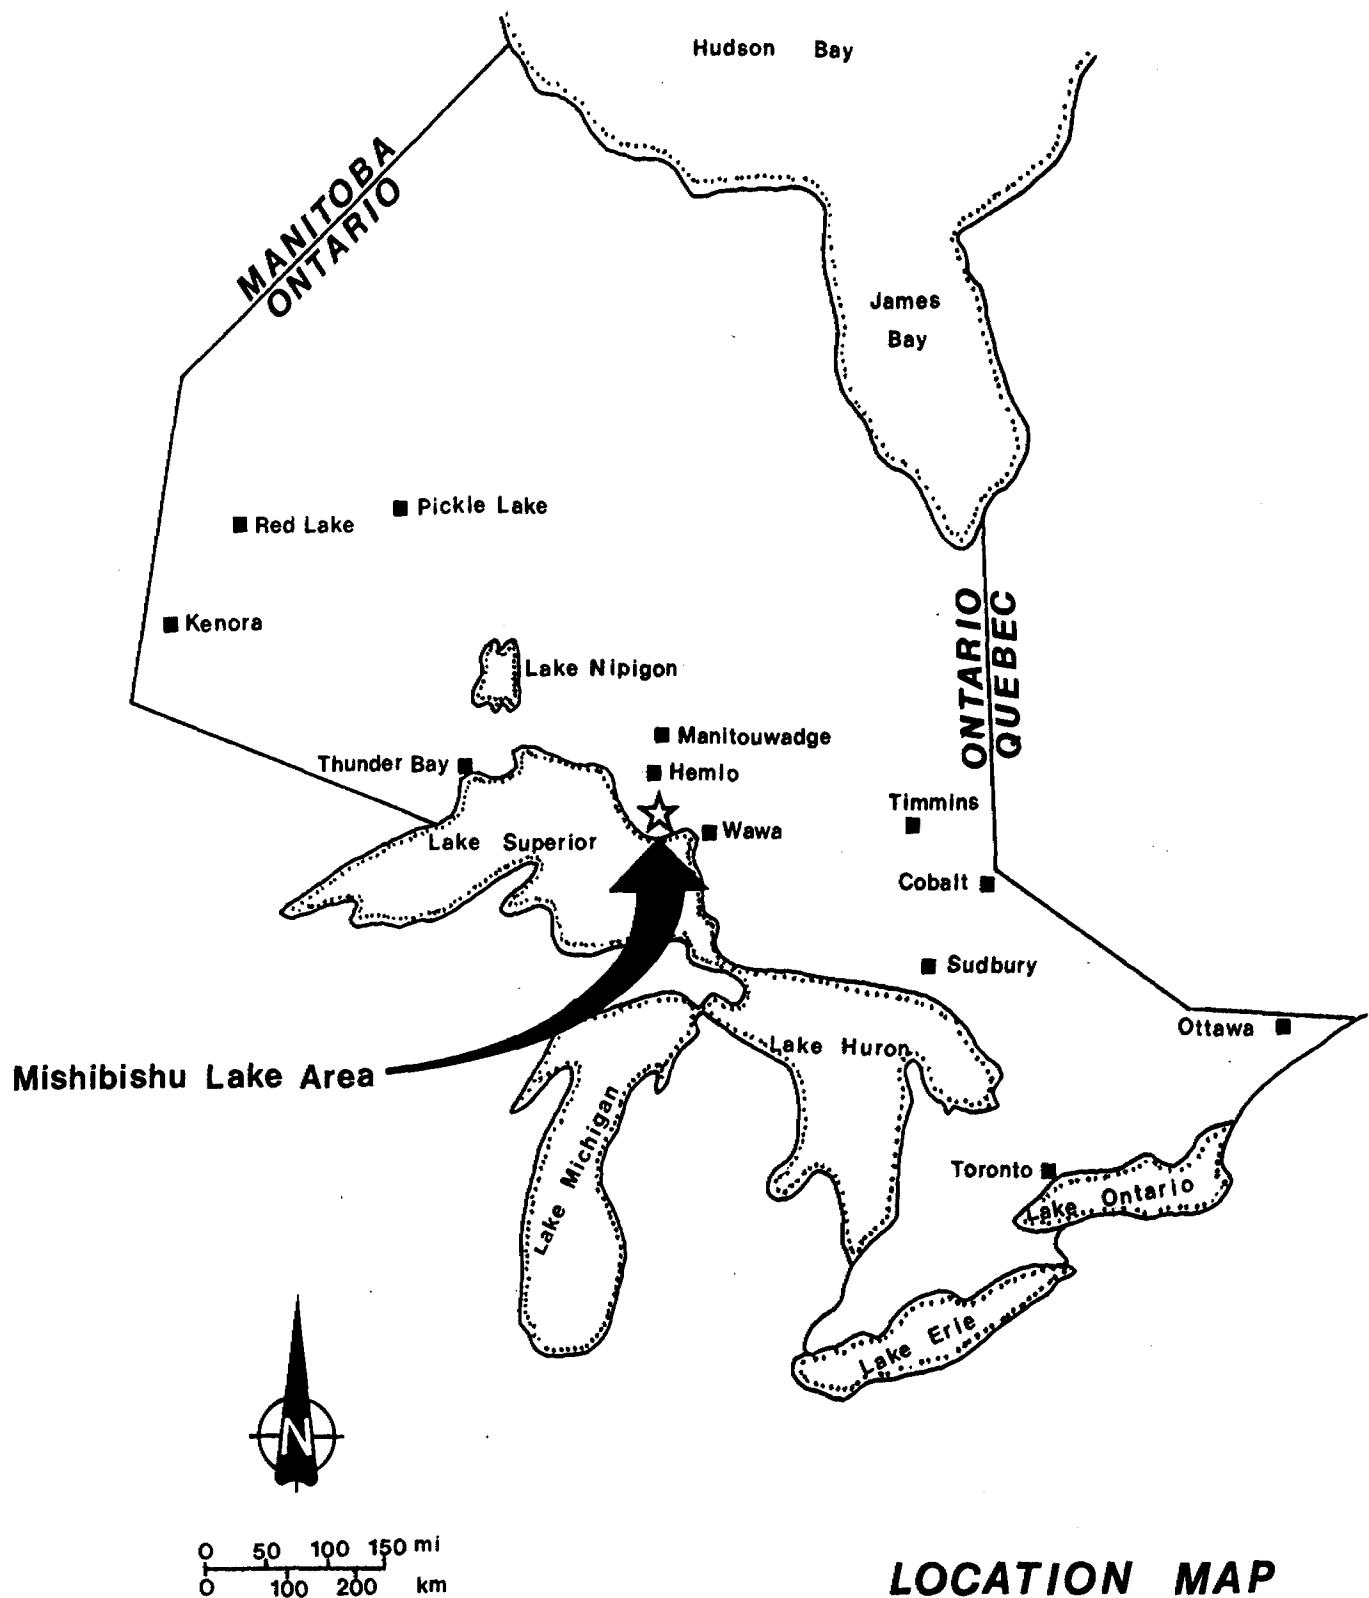

This report presents the results of the soil geochemical survey carried out over the northeast portion of the property employing a control grid. A total of 1,356 B horizon soil samples were collected at 25 m spacings and analyzed for gold, arsenic, copper and zinc.

2.0 LOCATION AND ACCESS

The Pukaskwa River property is located in the western portion of the Sault Ste. Marie Mining Division, approximately 17 km north of Lake Superior, 56 km west of Wawa and 72 km south of Hemlo (fig. 1).

The property is located in the north-central part of the Mishibishu Lake volcanic belt at approximately latitude 48 degrees 5 minutes north and longitude 85 degrees 40 minutes west. This property is bordered by San Paulo Explorations to the east and Caribbean Resources to the west (fig. 2). The Magnacon gold deposit is located approximately 12 km to the east.

Access to the property is available only by helicopter. There are no lakes of suitable size in the vicinity for fixed wing aircraft. In 1987 a gravel road was completed to the Magnacon deposit which provides access to Highway 17.

- Figure 1 -

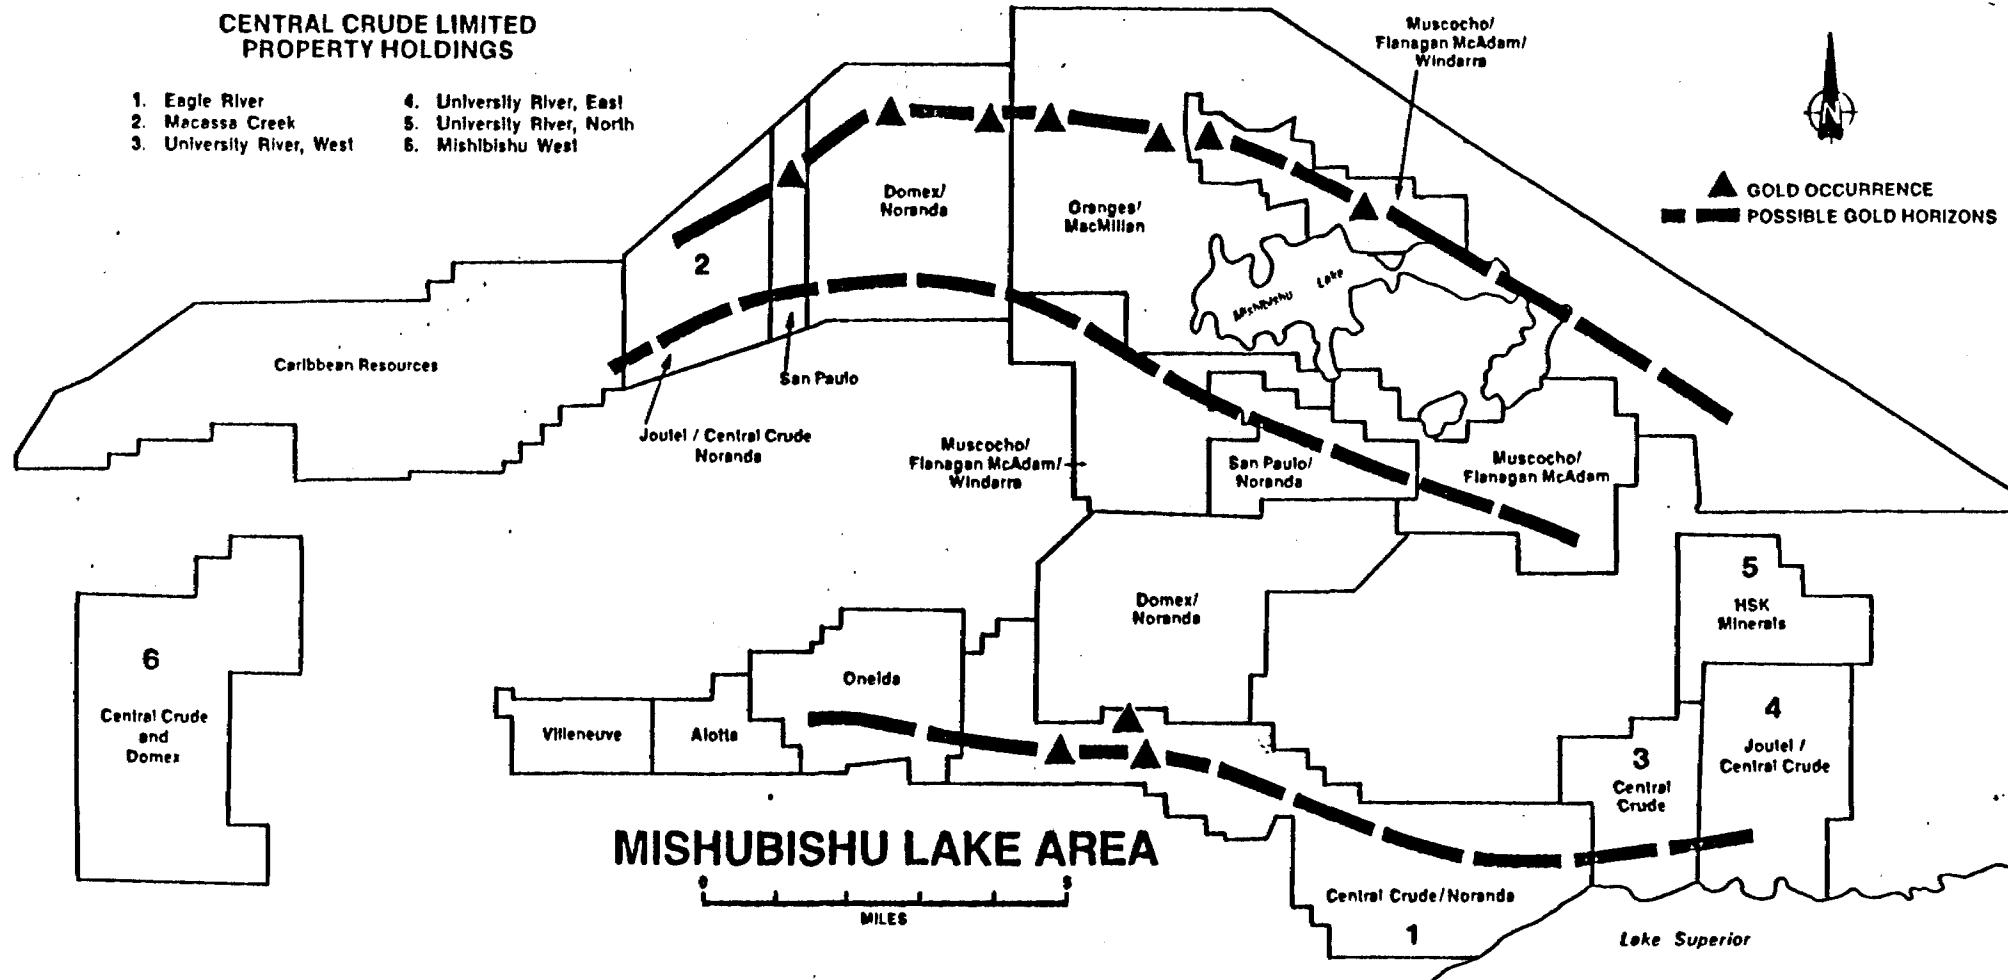

Figure 2

3.0 PROPERTY DESCRIPTION

The property consists of 99 unpatented mineral claims comprising approximately 1,600 hectares in the area of Davids Lake, plan number M-12, in the Sault Ste. Marie Mining Division (fig. 3). The claims are recorded in the name of Joutel Resources Limited and are numbered as follows:

SSM 779314 TO SSM 779376 inclusive, recorded June 11, 1984

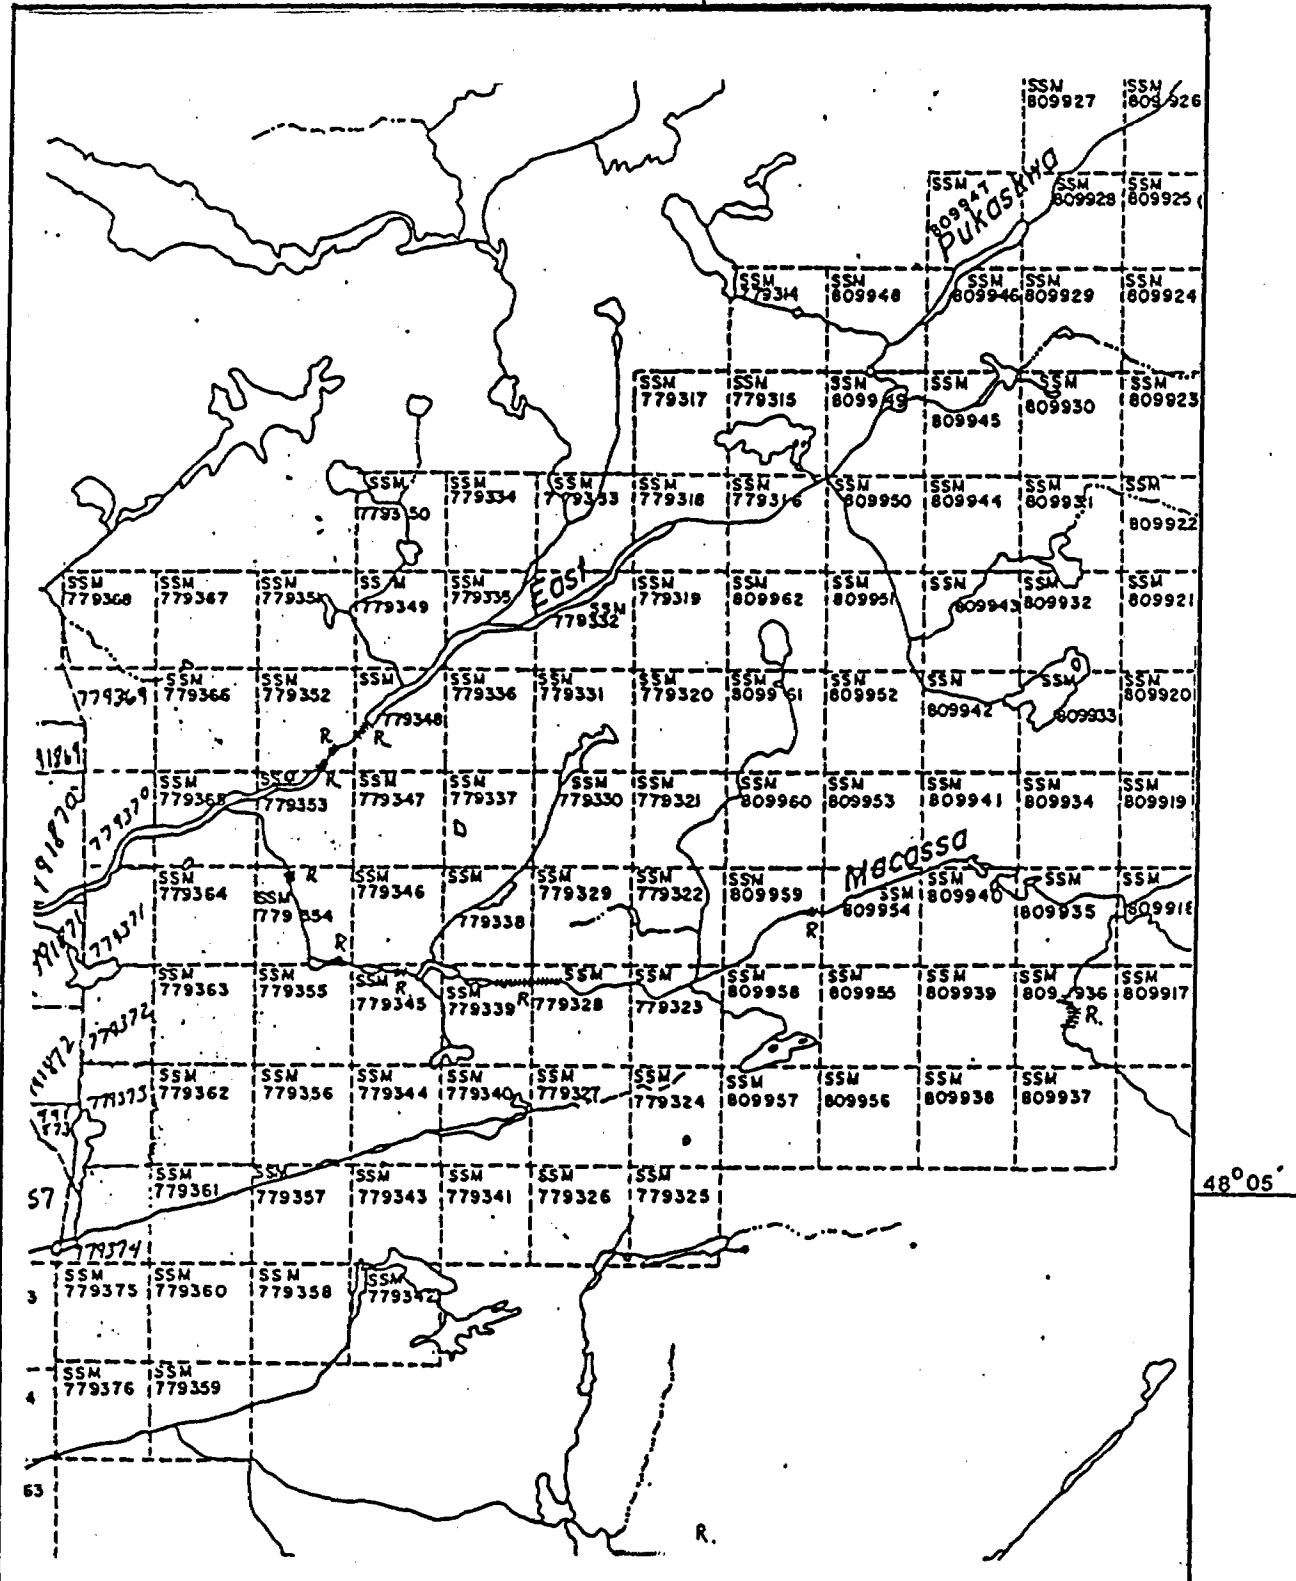

SSM 809927 TO SSM 809962 inclusive, recorded June 11, 1984

4.0 EXPLORATION HISTORY

Historically the Mishibishu Lake belt has been inconsistently explored due to the limited accessibility. The entire belt was covered by an airborne electromagnetic survey by Asarco Exploration of Canada in 1972. A number of conductors were checked with the nearest to the property located approximately 5 km east. In this area a drill hole reported an intersection of 0.08 oz. gold/ton over 2.9 feet. There is no evidence in the field or in the assessment records of any ground work being performed on the Pukaskwa property.

The property was covered by two other airborne geophysical surveys, in 1983 (Aerodat) and in 1985 (Terraquest).

Reconnaissance field work was done in 1985 by W. McGuinty on behalf of Joutel Resources mostly on the southern portion of the claim group in the vicinity of a series of airborne conductors. Several short traverse lines were run with pace and compass. Six airborne conductors were confirmed by VLF and a total of 98 soil and rock samples were taken.

5.0 GENERAL GEOLOGY OF THE MISHIBISHU LAKE BELT

The Mishibishu Lake belt was first mapped in 1940 by E.L. Evans for the Ontario Department of Mines. In 1968, G. Bennett and P.C. Thurston remapped the belt on a scale of 1:63,360 and this work was published by the Ontario Ministry of Natural Resources (Geoscience Report 153). In 1985, the belt was remapped by Bowen and published on Preliminary maps P2970, 2968, 2971 and 2972.

The Mishibishu Lake belt represents an isolated arc shaped mass of metavolcanic and metasedimentary rocks situated in the central portion of the Wawa greenstone belt. It has an east-west orientation measuring 16 km wide and 55 km long and is composed of a complex series of mafic and felsic volcanic rocks with associated sequences of metasediments. The volcanic rocks have been intruded by early Precambrian gabbroic bodies and mid to later Precambrian diabase dikes and Proterozoic lamprophyres.

Three major granitic batholiths intrude the volcanic belt to form north south limbs. The two larger felsic intrusions grade from granite to granodiorite to quartz monzonite and the stock in the vicinity of Mishibishu Lake is composed of quartz monzonite and porphyritic syenite.

The western and southern portions of the belt are represented by mafic, intermediate and felsic metavolcanic rocks with only minor sequences of metasediments. Along the north and eastern portions of the belt, metasedimentary rocks occur more frequently with fringe margin sequences of metavolcanic rocks. Isolated discontinuous units of iron formation occur in mafic volcanic rocks in the western and southern portions of the belt. The most continuous zone of iron formation occurs in a metasedimentary horizon north of Missing Lake in the central portion of the belt.

Numerous northeast and southwest trending lineaments visible on topographical maps and air photos indicate the presence of faults and shear zones. Displacement along these structures appear minor.

The Ontario Geological Survey have identified three deformation zones in the belt associated to sheared and strained linear features near major volcanic-sedimentary contacts (fig. 4). The most extensive is the Mishibishu Deformation Zone located on the north limb of the belt hosting the Magnacon deposit and other significant gold discoveries. A second is the Eagle River Deformation zone located on the south limb of the belt hosting the No Name Lake gold discoveries of Hemlo Gold and Central Crude Limited. The third is the Rook Lake Deformation Zone which occurs south of the Mishibishu Lake Stock and extends westward along the southern margin of the north limb of the belt. These high strain zones offer excellent potential for gold exploration.

6.0 PROPERTY GEOLOGY

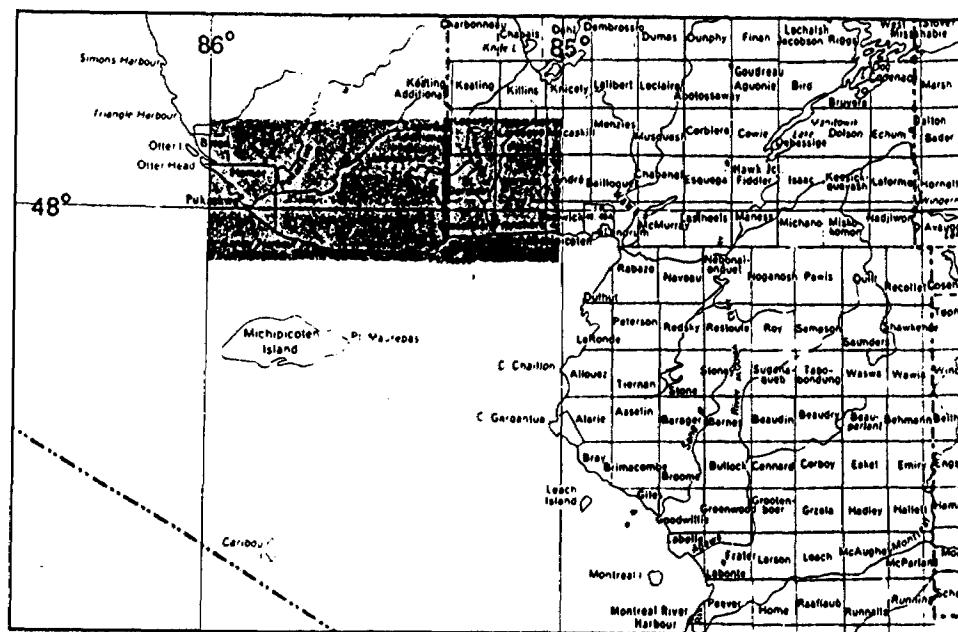

The Pukaskwa Property straddles the north limb of the Mishibishu Lake belt. Generally the property is underlain by a thick, northeast-southwest trending, northwest dipping sedimentary basin flanked on the north and south by mafic to felsic metavolcanic rocks. This volcanic / sedimentary sequence measures some 4.5 km thick and is bordered to the north and south by batholithic granitoid rocks.

The northern metavolcanic sequence is principally composed of tholeiitic basalt and mafic tuff. Intercalated with this sequence are units of lapilli tuff and crystal tuff.

The central metasedimentary sequence represents a package comprising units of wacke, conglomerate and argillite. The central portion of this sequence is represented by conglomerate with interlayers of wacke which grades dominantly into wacke to the north and wacke/argillite to the south.

The southern metavolcanic sequence is composed of a felsic flow and tuff unit flanked to the north and south by mafic and intermediate metavolcanics.

Two shear or deformation zones occur on the property lying conformable to the stratigraphy. The north zone represents the western extension of the Mishibishu Lake Deformation Zone which hosts the Magnacon deposit and other gold discoveries to the east. This deformation zone occurs near the northern metavolcanic / metasedimentary contact in the northeastern portion of the property. The western extent of this deformation zone is not known. The south zone represents the western extension of the Rook Lake Deformation Zone. It occurs in the southern metavolcanic sequence along the mafic / felsic volcanic contacts.

7.0 MINERALIZATION

The Pukaskwa Property has never been explored in detail. The only recorded ground prospecting was done on the reconnaissance scale in 1985 by W. McGuinty under the employ of Joutel Resources. Based on the results of this work three types of mineralization have been defined to date : a) base and precious metals in graphitic horizons; b) gold in narrow quartz-tourmaline veins; and c) gold in pyrite and carbonate bearing sediments.

Nine rock samples collected by McGuinty (1985) were analyzed. A sample from a graphitic unit corresponding with an electromagnetic unit on the Rook Lake Deformation Zone in the southwestern quarter of the property returned 35 ppb gold, 1.43% zinc and 150 ppm copper.

Quartz-tourmaline veins have been encountered in the northern volcanic sequence and are known to occur in this unit east of the property boundary. They are variable in width and those observed by McGuinty (1985) are generally less than 30 cm wide. A sample of this vein type, with 1 to 2% pyrite, returned a value of 40 ppb gold.

Weak gold mineralization was encountered in a chloritic silt unit carrying carbonate and 2 to 3% pyrite, within the conglomerate of the central sedimentary sequence. The sample taken by McGuinty (1985) returned 30 ppb.

The highest gold values returned from the reconnaissance sampling of 1985 are weak but indicate above background values and indicate that three different geological environments might have some potential and are worth exploring further.

8.0 GEOCHEMICAL SOIL SURVEY

A soil geochemical survey was carried out over a control grid on the northeastern portion of the property north of the base line between lines 10+00 E and 30+00 E. A total of 1,356 B horizon soil samples were collected at a 25 m spacing. The samples were sent to Assayers Ontario Limited in Toronto and analyzed for gold, arsenic, zinc and copper.

Results of this survey are displayed on the maps accompanying this report. Chemical analyses are enclosed as appendix A

Three coincident anomalous Au, As and Zn zones occur over the survey area related to specific geological units. Anomalous zones represent Au values in excess of 50 ppb, with As and Zn in excess of 50 ppm. Cu provided no anomalous results.

Zone 1

This zone occurs between the East Pukaskwa River and tie line 12+00 N striking in a northeast/southwest direction for a length of 1,900 m. It is composed of three anomalies which from east to west become narrower and less continuous. This zone overlies and is conformable to a 500 m thick sequence of mixed volcanic and pyroclastic rocks.

The eastern gold anomaly is elliptical in shape measuring up to 400 m wide recording values up to 90 ppb. The western extent of this anomaly is unclear due to incomplete survey coverage. As and Zn values related to this anomaly record up to 200 ppm and 80 ppm respectfully.

The central anomaly measures 350 m long recording Au and As values up to 100 ppb and 127 ppm respectfully. No anomalous Zn values are associated to this anomaly.

The western anomaly measures 300 m long recording Au, As and Zn values up to 90 ppb, 60 ppm, and 95 ppm respectfully.

Zone 2

This zone occurs between the grid base line and tie line 12+00 N. It is represented principally by a series of gold anomalies which generally trend in a northeast/southwest direction across the property. This zone is underlain by a 1,200 m thick sequence of metasedimentary rocks composed of greywacke, conglomerate and argillite.

A series of three discontinuous gold anomalies lie south of line 12+00 N trending across the northern portion of this zone. Each of these anomalies measure approximately 300 m in length and record gold values up to 100 ppb. These anomalies have no significant As or Zn association.

In the east/central portion of this zone a large area of anomalous gold values occur between lines 18+00 E and 26+00 E. It appears that this area is represented by a stacked series of narrower anomalies that trend northeast/southwest and record gold values up to 100 ppb. No significant As or Zn anomalies occur in this area.

In the western portion of this zone two closely spaced gold anomalies occur centered on line 14+00 E. The northern anomaly trends northeast/southwest for 150 m and records values up to 120 ppb. The southern anomaly is the strongest on the property trending in a northwest/southeast direction. This anomaly measures 400 m long with values to 200 ppb. No elevated As or Zn values are associated to this anomaly. The only reported Cu anomaly (398 ppm) occurs in this vicinity on line 15+00 E, 600 m north of the baseline.

A single 100 ppb gold anomaly occurs on line 11+00 E approximately 200 m north of the base line.

The largest and most extensive Zn anomaly occurs in this zone on line 19+00 E extending 400 m north of the base line. This grid north/south trending anomaly records values up to 315 ppb and may represent concentration associated to a diabase dike or fault zone.

Zone 3

This zone is located south of the base line underlain by a mixed sequence of argillaceous metasediments and intermediate volcanics. Only four lines were sampled in this area identifying 3 northeast/southwest trending anomalies.

The northern anomaly is 200 m wide with a peak value of 110 ppb located 25 m south of the base line on line 19+00 E.

Two smaller, one line anomalies occur to the south on line 18+00 E recording values up to 103 ppb and 80 ppb respectfully.

Located 2,800 m to the west on lines 10+00 W and 8+00W is a stacked anomaly centered 200 m south of the base line. Here Au, Zn, As values of 62 ppb, 182 ppm and 225 ppm respectively occur suggesting the possible western extension of Zone 3.

9.0 CONCLUSIONS AND RECOMMENDATIONS

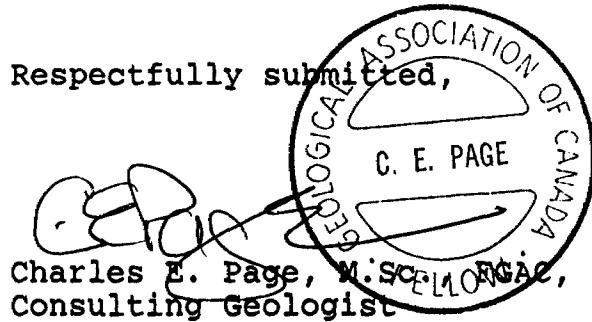

The results of the geochemical soil survey over the northeastern portion of the property has identified three zones of anomalous Au, Zn and As levels in soils overlying three separate distinct lithologies. All anomalies are semi-conformable to the geology and deformation zones in the area.

East of the property Dominion Explorers, Granges Exploration and Muscocho Explorations have made gold discoveries along the Mishibishu Lake deformation zone. This deformation zone has been projected to extend onto the Pukaskwa property in the vicinity of the soil survey.

Since anomalous gold values have been determined in soils in the vicinity of a known gold bearing deformation zone the results are considered significant and further work is warranted. To further define and trace the extent of the existing soil anomalies as well as test the Rook Lake deformation zone on the southern portion of the property a complete soil survey of the Pukaskwa property is recommended.

In addition detailed geological mapping and prospecting is recommended over the entire property with specific emphasis in the vicinity of the Mishibishu Lake and Rook Lake deformation zones.

Respectfully submitted,

April 29, 1988

June

CERTIFICATE OF QUALIFICATION

I, Charles E. Page, of 1454 Westbury Avenue, in the City of Burlington, in the Province of Ontario,

DO HEREBY CERTIFY:

1. THAT I am a graduate of Brock University (1975) with a degree of Bachelor of Science (B.Sc) with Honours in Geological Sciences, and the University of Waterloo (1983) with the degree of Master of Science (M.Sc) in Earth Sciences.
2. THAT I am a Fellow of the Geological Association of Canada.
3. THAT I have been practicing my profession as a geologist and engaged in exploration since 1975.
4. THAT I have worked in the Mishibishu Area for five seasons since 1983 carrying out exploration. I have worked intermittently in northern Ontario since 1975.
5. THAT I have supervised the exploration carried out on the property disclosed in this report.

April 29, 1988

Charles E. Page, M.Sc., FGAC
Consulting Geologist
Burlington, Ontario, Canada

Dear Madam:

Re: Notice of Intent dated July 4, 1988
Geochemical Survey and Data for Assaying
submitted on Mining Claims SSM 779314 et al
in the Area of David Lakes

The assessment work credits, as listed with the above-mentioned
Notice of Intent, have been approved as of the above date.

Please inform the recorded holder of these mining claims and so
indicate on your records.

Yours sincerely,

W.R. Cowan, Manager
Mining Lands Section
Mines & Minerals Division
