INCENTIVES OFFICE

SUMMARY REPORT ON THE  
1990 DIAMOND DRILLING PROGRAM  
CLINE LAKE PROPERTY

NORANDA EXPLORATION COMPANY, LIMITED  
(no personal liability)

October 1990  
Timmins, Ontario

Robert F. Calhoun  
Senior Project Geologist

OMIP 90-083

## INTRODUCTION

During September 1990 Noranda Exploration Company, Limited (no personal liability) undertook a two hole drilling program on the Cline Lake property designed to further evaluate the potential of moderate grade wide mineralized intersections from previous drilling.

The two holes were completed for a total of 1758.5 feet (535.99m). This brings the property total to 50,073.2 feet (15,252.3m) since Norex became operator.

## LOCATION, ACCESS, STATUS

The Cline Lake property is located in Jacobson Township in the Sault Ste. Marie Mining Division, approximately 50 kilometers northeast of Wawa and 15 kilometers east southeast of the town of Dubreuilville. Access is provided from Wawa via highway 17 (north 40 kilometers) and Highway 519 (east 30 km) to Dubreuilville and by all weather logging roads (20 kilometers east southeast) to the property.

On-property access is by the old mine road and a powerline, owned by Great Lakes Power, which bisects the property.

A boundary survey required to convert the claims to a mining lease was completed by MacDougall and Wilson (O.L.S.) of Sault Ste. Marie and awaits government approval. The lease has been identified as CLM 331.

#### DIAMOND DRILLING

A total of 1758.5 feet of drilling was completed in two holes, during the month of September 1990. The reader is referred to Appendix I for summary logs of each hole which provide intersected lithologies, collar locations and a complete list of assay results. For a complete description of lithologies refer to diamond drill logs located in attached pockets with drill sections.

The results of each hole are discussed below:

#### DDH CL-90-87

Location: 2900E, 400N  
Dip: -63°  
Azimuth: 00N

This diamond drill hole intersected a sequence of mafic volcanics, porphyry mafic volcanics and the mineralized target zone which has been disrupted by a diabase dyke (which may be relatively flat lying).

#### DDH CL-90-88

Location: 2600E, 365N  
Dip: -65°  
Azimuth: 00N

As in 90-87, this hole intersected the same sequence of mafic volcanics, porphyry, mafic volcanic, mineralized target zone and mafic volcanics. The mineralized zone again has been disrupted by a diabase dyke.

The 88-60 zone into which these holes were targeted has proven to be the most consistently mineralized zone located on the Cline property to date. The first hole 88-60 located the mineralization zone which when averaged returned a wide intercept grading 0.085/73 feet (core length). Based on this intercept two holes 90-85, 86 were drilled to intersect the zone down dip and along strike. Hole 90-85 returned 0.157 opt/49.2 (core length) and 90-86 - 0.121 opt/58 feet. The mineralized zone in these holes is a quartz veined, carbonated, sulfidized zone in mafic volcanics. Visible gold is contained in the quartz veining. With continued encouraging results a wide step-out program of two holes was designed to extend the zone across a strike length of 300 feet and further down dip 200 feet. It was felt that if the zone was to develop tonnage it would have to continue to these depths.

The first hole 90-87 intersected the mineralization at a depth of ~600 feet. Unfortunately the target has been disrupted by a diabase dyke. This dyke, from core angles, gives conflicting information on its dip. The dyke could either be subvertical or shallow. Although disrupted an intersection grading 0.127 opt/26.5 feet (core length) was penetrated. The mineralization is contained in mafic volcanics which have been carbonatized, with less quartz

veining than in holes 90-85, 86. Visible gold was located in a small quartz vein and in a siliceous, sulfidized section of the mafic volcanics.

Hole 90-88 also intersected the mineralized zone which although similar to 90-87 contained less sulfides, and was carbonatized over shorter sections. Again the diabase dyke was located within the targeted zone which would appear now to be a shallow dipping dyke. The target zone in this hole returned a grade of 0.054 opt/12.8 feet at the upper side of the zone with the lower end of the zone being disrupted by the diabase dyke. The target zone in this hole may also have bifurcated. If the dyke is indeed flat or shallow the continuation of the mineralized zone below the dyke is possible, and presents a good exploration target.

#### CONCLUSIONS AND RECOMMENDATIONS

Although sub-economic grades were returned for the intercepts located in holes 90-87/88 they did confirm the continuation of the mineralized zone a further 200 feet down dip. The presence of a diabase dyke, which has disrupted the zone, has had a negative affect on the total contained gold of the 88-60 zone. If this dyke is sub-horizontal the continuation below the dyke presents a good exploration target.

Further drilling on the 88-60 zone is recommended to determine if the zone continues and if economic grades can be delineated. Although this drilling only has a moderate success rating the total costs would be minimal in relations to the cost incurred to date.

The following two holes are recommended by the author to test the above:

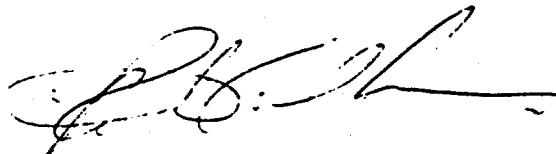

Hole A

Location: 2600E/400N  
Azimuth: 00N  
Dip: -74°  
Length: 1100 ft.

Hole B

Location: 2900E/365N  
Azimuth: 00N  
Dip: -73°  
Length: 1100 ft.

Respectfully submitted

Robert F. Calhoun  
Senior Project Geologist
