## SUMMARY

The Sullivan project is located approximately 65 kilometres east of the Hemlo gold deposit and 32 kilometres north-northeast of the town of White River, Ontario. Golden Trio Minerals Ltd. can earn a 100% interest in the project from 757410 Ontario Ltd. via annual share and cash payments.

The property encompasses the Dayohessarah greenstone belt, a crescent shaped north trending volcano-sedimentary sequence lying midway between the larger Hemlo and Kabinakagami greenstone belts.

Portions of the property have been worked on by several companies in the past, including CP Rail (1958), Canex Aerial Exploration (1969), Shell Canada (1975), Pezamerica resources Corp. (1983-87), and Black Cliff Mines Ltd. Recent exploration work on the claims on behalf of the joint venture by Hemlo Gold Mines from 1989 to 1991 has included airborne and ground geophysics, reconnaissance prospecting and soil sampling and limited geological mapping. This work has indicated the potential for a new gold discovery on the claims. Significant gold values have been obtained from an occurrence within a regional shear system (deformation zone), the "Sugar Zone Occurrence" which lies on the west side of Dayohessarah Lake and has been traced on the ground for a distance of 750 metres on the claims. Gold values obtained from the Sugar Zone include grab samples of 2.1, 1.34 and 1.01 oz/ton gold and 2 chip samples taken normal to the structure returned values of 0.451 oz/ton over 6 metres and 3.6 oz/ton gold over 1 metre. In addition

to the Sugar Vein, other targets on the property remain to be tested including; airborne geophysical anomalies, and base metal mineralization intersected by diamond drilling during the 1987 Pezamerica program, Mascot Gold Mines Ltd. conducted the work on behalf of Pezamerica. Also, previous soil sampling on the claims during the Pezamerica program identified a number of gold soil anomalies which remain unexplained.

In the spring of 1993, a first pass reconnaissance program was conducted over the claims by Golden Trio. This program uncovered a mineralized zone, 12 metres wide with good chalcopyrite and pyrite which also contained anomalous gold with two samples assaying 94 and 141 ppb gold.

A follow-up evaluation program was completed this fall between August 18, 1993 to September 30, 1993 at a cost of \$33,037.09. The work consisted of linecutting, ground geophysics, soil geochemistry, and geological mapping. No significant gold anomalies were detected by the soil survey. A number of single station anomalies were indicated by the survey which may warrant further investigation. No significant alteration zones or structures were revealed during the geological mapping.

## INTRODUCTION

This report summarizes work completed during a linecutting, prospecting, geological mapping, soil sampling, and ground geophysics program completed on the Sullivan project under option to Golden Trio Minerals Ltd. Minerals Inc. in the White River region of northwestern Ontario. Work was conducted between the dates of August 18 and September 30, 1993 at a cost of \$33,037.09. A total of 28 rock samples and 945 soil samples were collected on the Golden Trio claims and sent for analysis.

## LOCATION AND ACCESS

The Sullivan project consists of 7 unpatented mining claims totalling 25 units, located approximately 32 kilometres north-northeast of the town of White River, Ontario (Figure 1), latitude  $48^{\circ}45'N$ , longitude  $85^{\circ}00'W$ , NTS 42C/14, within the Sault Ste Marie Mining Division of northwestern Ontario. The claims lie within Hambleton Township.

The property is accessible via Domtar gravel logging roads (#100 and #200) as well as numerous secondary arteries off these main roads which extend to within 500 metres of the southwest shore of Dayohessarah Lake. A trail extends from the south end of Dayohessarah Lake to secondary logging road #200. Access could also be gained by helicopter or fixed wing aircraft. In the winter, the property is accessible by a snowmobile trail from the

Hornepayne Highway 631 starting at about 300 metres north of the Nameigos River.

#### PHYSIOGRAPHY AND VEGETATION

The central portion of the project centred on Dayohessarah Lake is of low relief and covered by glacial outwash material. Low rolling hills characterize the terrain on the west and east sides of the lake. Elevations range from a low of 390 metres to a high point of 495 metres on the east side of the Lake. Bedrock exposure on the property is less than 10%.

Forest cover consists of immature black and white spruce, balsam and pine accompanied by large stands of birch and poplar. low lying areas and swamps are covered in tag alders and cedar.

#### CLAIM STATUS

Golden Trio Minerals Ltd. can earn a 100% interest from 757410 Ontario Ltd. via annual share and cash payments.

The claims which comprise the Sullivan project are listed on Table 1 and shown on Figure 2. The claims will be extended by three year upon approval of the work described in this report.

**PREVIOUS EXPLORATION WORK**

At least six companies have previously been active in the area.

In 1958, a geological survey was conducted for the Canadian Pacific Railway covering a large area encompassing the Dayohessarah and Kabinakagami Greenstone Belts.

In 1969, Canex Aerial Exploration Ltd. initiated a program that included shootback EM, radem magnetometer and geological surveys in the vicinity of gabbroic to ultramafic intrusions at the north end of Dayohessarah Lake. The program culminated in the drilling of three diamond drill holes totalling 1117 feet. The best intersection recorded contained 0.326% Ni and 0.08% Cu over 5 feet, or 0.2% Ni and 0.1% Cu over 30 feet in metagabbro.

In 1975, Shell Canada Ltd. mapped the central part of the greenstone belt at a scale of 1 inch to 1/4 mile, as a guide for an airborne survey to be completed at a later date. There is no record of a subsequent airborne survey by this company.

Between 1983 - 1986, an exploration program was conducted by Pezamerica Resources Corp. who sub-contracted Dighem Ltd. to perform airborne EM and MAG surveys. This survey, which consisted of 1,252 line kilometres on 1/6 mile line spacing, was conducted between February 10 and March 10, 1983 and outlined 31 Dighem anomalies. Twenty-four of these anomalies were investigated by Teck Exploration Company at the request of Pezamerica. Commencing in July, 1983 Teck conducted regional geological mapping and soil geochemical sampling. The regional geochemical data was statistically analyzed to give a threshold of 5 ppb (92nd percentile), with 137 anomalous values of 9-26 ppb (95.5-99 percentile), and 35 highly anomalous (>26 ppb) samples (>99 percentile) obtained from the sampling. A soil gold anomaly was outlined on the west side of Dayohessarah Lake. During the winter of 1983/84, Teck drilled 9 of the airborne geophysical targets. In all cases these conductors were caused by significant amounts of pyrite and pyrrhotite within a sequence of felsic volcanic rocks.

During the month of August 1985, Mascot Gold Mines Ltd., on behalf of Pezamerica, undertook a program to follow-up on some of the soil anomalies detected by the Teck survey. Twenty four grids

were laid out on the property. Detailed soil sampling and mapping was conducted over these areas.

In 1988, United Reef Petroleum Ltd. sub-contracted Stratigraphic Research to conduct a total field magnetic survey which outlined linear NW-trending magnetic highs on the west shore of Dayohessarah Lake.

In 1988, Noranda Explorations conducted a reconnaissance soil and rock geochemistry program on the claims. A total of sixty soil samples and sixty-eight rock samples were collected and analyzed for gold. Nine of the rock samples returned values of 0.17 g/tonne, all other samples were not anomalous.

In 1989, Northwest Geophysics Ltd. conducted magnetometer and VLF surveys for Black Cliff Mines Ltd. with no apparent follow-up.

Most recent interest in the belt first developed when a zone of silicification, sulphide mineralization and anomalous gold values was uncovered by forestry operations southeast of Dayohessarah Lake. Subsequently the entire greenstone belt was staked by a prospecting syndicate.

In 1990 an airborne MAG and VLF-EM survey was conducted by Terraquest Ltd. on behalf of Broad Horizons Trust. A group that optioned the claims from the syndicate.

When Broad Horizons failed to meet work commitments on the claims the prospecting syndicate approached Hemlo Gold Mines Ltd., Hemlo optioned the property. Initial prospecting by Hemlo personnel uncovered the "Sugar Zone" occurrence. Limited ground geophysics, including I.P., was conducted over three claims in the vicinity of this showing.

A legal action resulted between the prospecting syndicate and Broad Horizons. Work on the claims was suspended pending a settlement of the case. Golden Trio Minerals Ltd. conducted a one day evaluation of the Sugar Zone occurrence subsequent to entering into an option agreement with the staking syndicate. On April 5, 1993 an out of court settlement was reached with the Broad Horizons Trust enabling Hemlo Gold and Golden Trio Minerals Ltd. to proceed with an evaluation of the claims.

The most recent work on the claims was conducted by Golden Trio Minerals Ltd. in the spring of 1993. At that time, a reconnaissance program was completed over the Sullivan project (Figure 3).

#### REGIONAL GEOLOGY

The Dayohessarah belt forms a crescent shaped north-northwest trending greenstone belt 32 kilometres long by 6 kilometres wide situated between the larger Hemlo (to the west) and Kabinakagami (to the east) Greenstone Belts. The belt belongs to the Wawa

OREQUEST

GOLDEN TRIO MINERALS LTD.

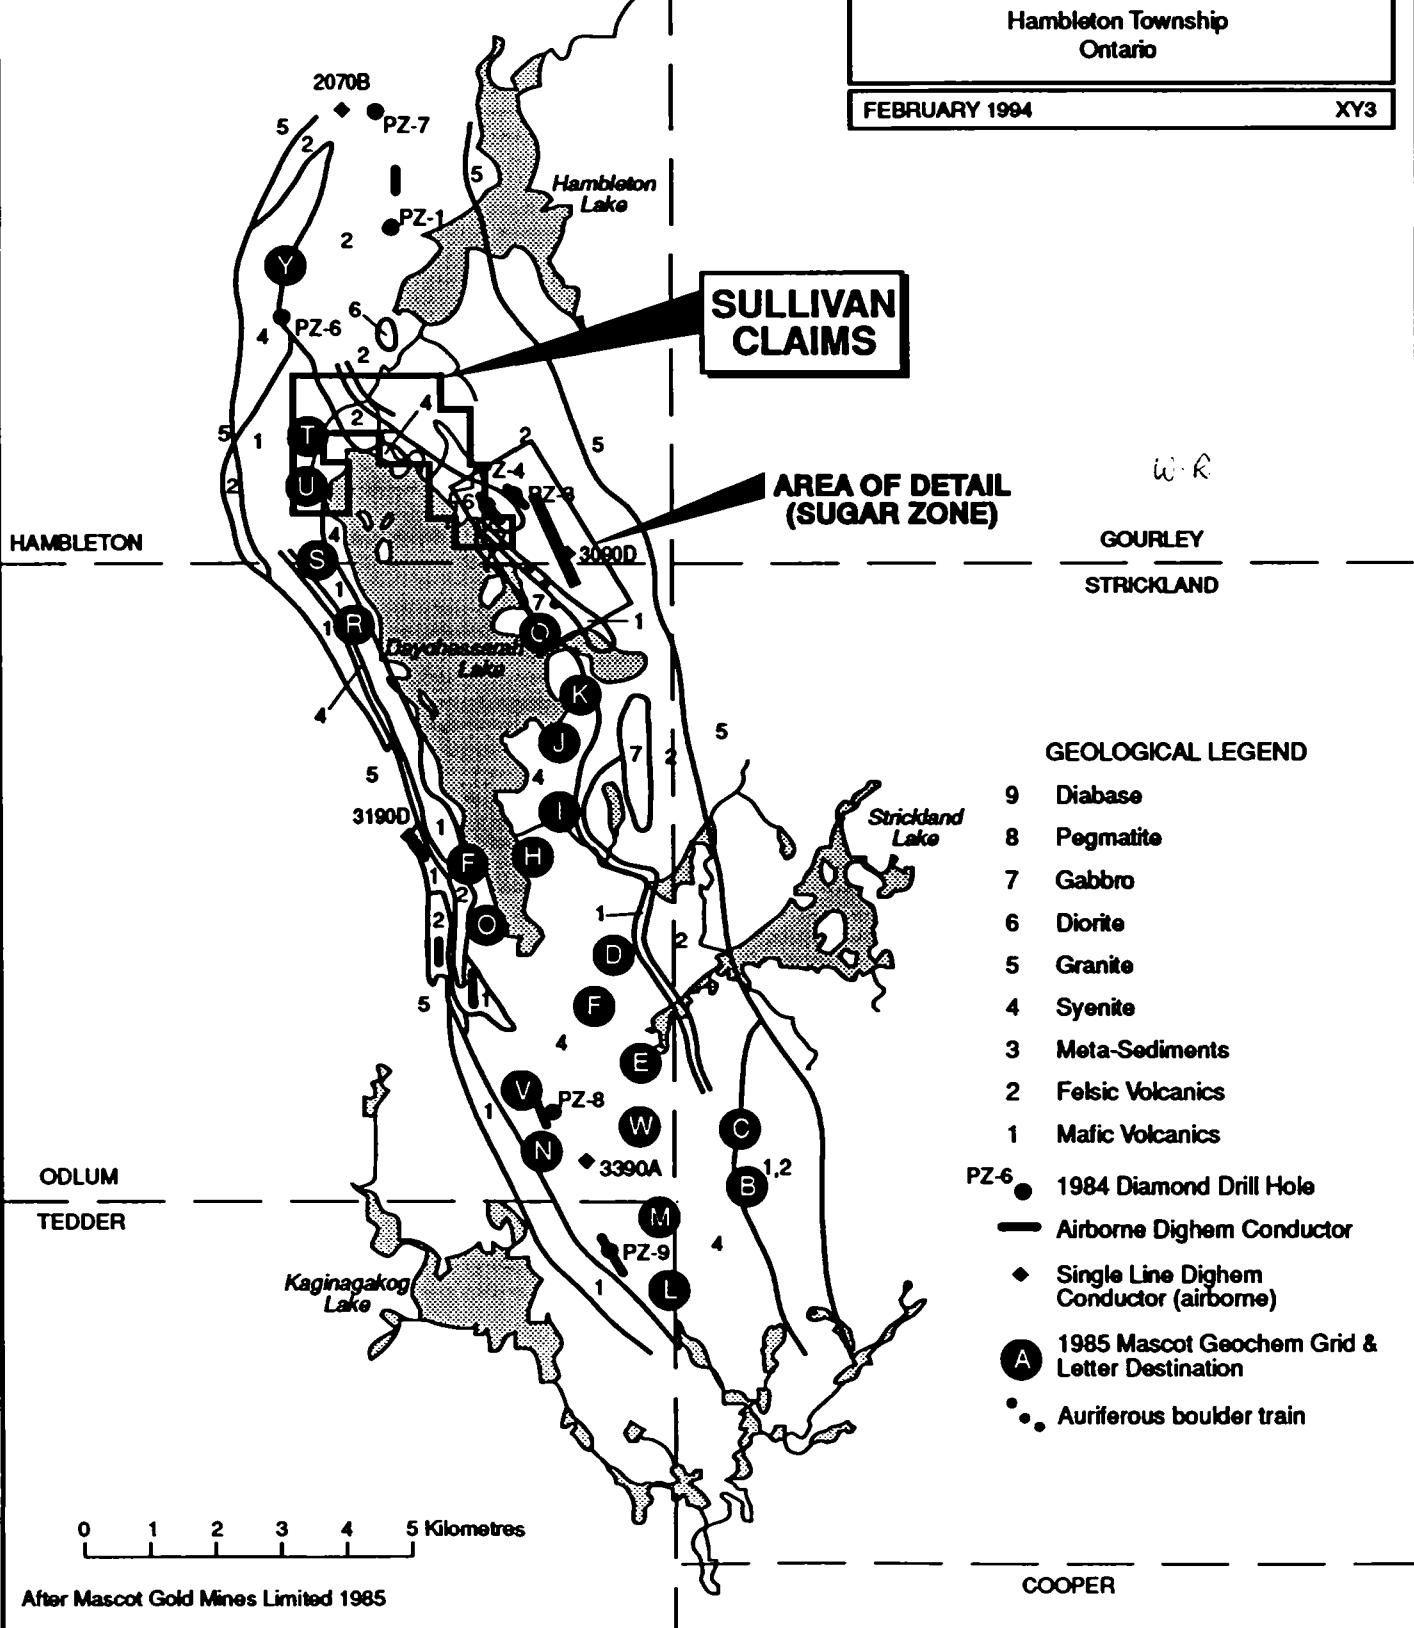

Figure 3

SULLIVAN PROJECT  
COMPILATION MAP

Hambleton Township  
Ontario

FEBRUARY 1994

XY3

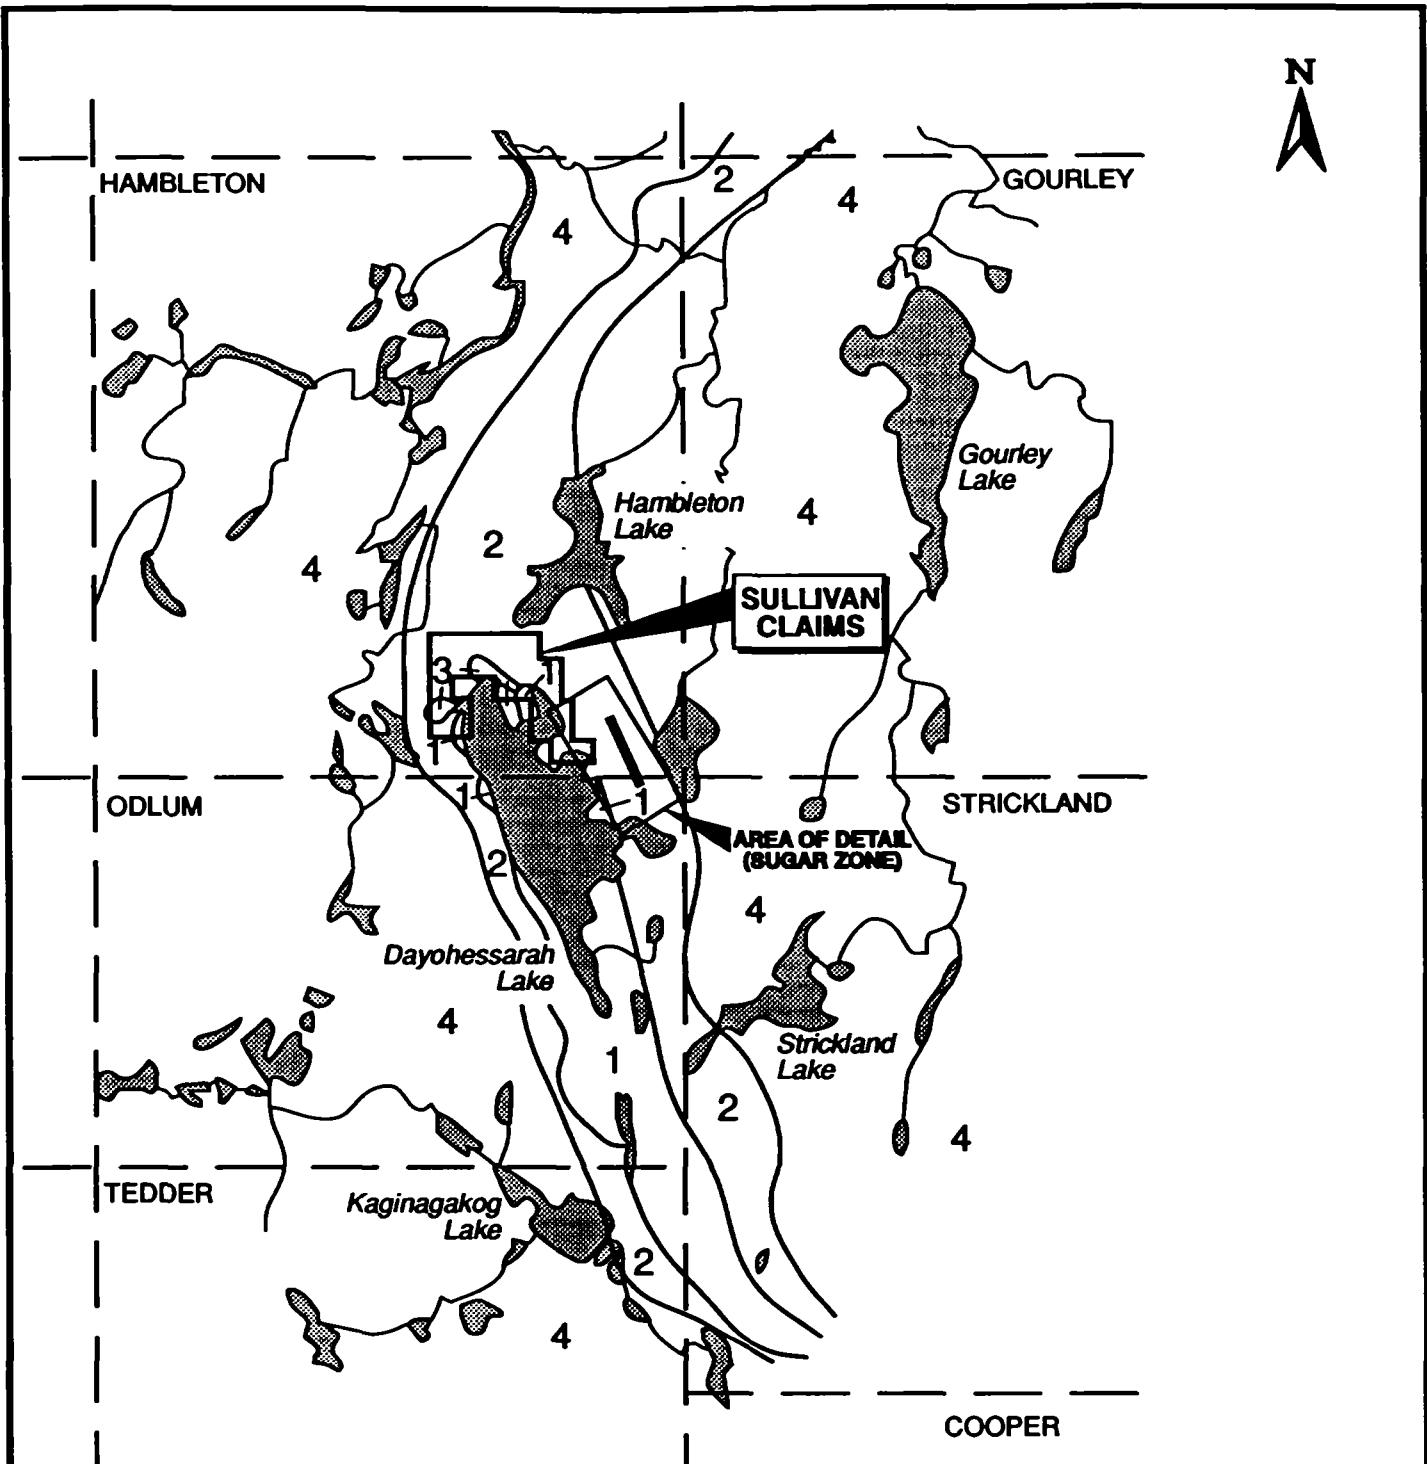

Subprovince of the Superior Province. The belt is a typical volcano-sedimentary greenstone sequence, although the north-south orientation of the belt is unique for the Wawa sub-province (Figure 4).

The supracrustal rocks consist of a central band of metasedimentary rocks located and centred on Dayohessarah Lake. This core is flanked and underlain by mafic volcanic flows and tuffs. The metasedimentary-metavolcanic sequence is enclosed and intruded by plutons and/or batholiths of tonalite to granodiorite and equivalent metamorphosed orthogneiss. Minor mafic to ultramafic stocks and dykes outcrop around the northern end of Dayohessarah Lake.

The metavolcanic rocks represent mixed and interbanded deformed mafic pillow flows, interflow mafic banded tuffs and waterlain mafic tuffs. The metavolcanic rocks have been metamorphosed to upper greenschist to lower amphibolite facies and locally to mid to upper amphibolite facies.

The metasedimentary rocks appear to have been derived from predominant volcanic provenance with a minor granitic component and are therefore interpreted to be locally to proximally derived. A local basal conglomerate is overlain by interbedded wacke, siltstone and volcaniclastic units. The metasediments have been differentially metamorphosed into quartz-biotite schists.

Figure 4  
**SULLIVAN PROJECT**  
**REGIONAL AND**  
**PROPERTY GEOLOGY**

Hambleton Township  
Ontario

The granitic rocks flanking the volcano-sedimentary package on the west side of the Dayohessarah Lake form a massive, medium to coarse grained polyphase composite pluton consisting of an older diorite phase, through tonalite to late granodiorite phases. All phases contain xenoliths of the supracrustal rocks and the later phases contain xenoliths of earlier phases. Pegmatite phases post date all of the above granitoid rocks and crosscut them.

Gabbro and metagabbro occur as sills and small stocks around the north end of Dayohessarah Lake. Pegmatite, aplite and granitic dykes and sills are common throughout the belt. The youngest rocks in the region are represented by diabase dykes which cut all lithologies and trend predominantly northeast and northwest.

The Dayohessarah belt forms a south plunging symmetrical syncline with an axial trend of approximately 340 degrees at the core of the metasediments centred on and underlying Dayohessarah Lake. The resultant planar regional foliation and subparallel bedding trend at 310° to 340°, with steep to moderate easterly dips on the west limb and steep west dips on the east limb of the syncline. A deformation zone approximately 200 metres wide trending 340° occurs east of Dayohessarah Lake north of a small bay located midway along the east shore of the lake. This deformation zone is characterized by a weak to well developed foliation in the metavolcanic rocks. No extensive alteration zone is associated with this deformation zone.

## REGIONAL MINERALIZATION

The new gold discovery made by Hemlo Gold Mines Inc. has been named the "Sugar Zone" occurrence, located 1 kilometre east of the Sullivan project. The occurrence consists of multiple 1 to 5 metre wide foliation parallel to sub-parallel feldspar porphyry sills containing mineralized quartz veins. Gold values have been recorded from discreet zones within a package up to 50 metre wide.

The gold bearing porphyry sills contain intensely silicified zones which are highly strained, and exhibit a characteristic "sugary" texture. Sulphide mineralization consists of 3-5% disseminated and banded pyrite with appreciable amounts of sphalerite, galena and chalcopyrite associated with quartz veining. Quartz veins are typically 20 to 40 centimetres in width and multiple veins occur across widths from 1 to 6 metres in the core of the shear zone. The host rock to the zone is a mafic agglomerate containing abundant stretched granitic fragments.

The shear zone trends  $340^{\circ}$  with a dip of  $65^{\circ}$  to  $75^{\circ}$  to the west. The silicified package within the shear is conformable to this trend. The mineralized zone has been trace on surface for 750 metres, and is open along strike, to both the north and south.

Highlights of sampling include grab samples of 2.10, 1.34 and 1.01 oz/ton Au. Two chip samples taken normal to the structure returned values of 3.60 oz/ton Au across 1 metre and 0.451 oz/ton Au across 6 metres. The zone was traced for 610 metres of the

reported 750 metre strike length, with measured widths between 2 and 14 metres. The average width of the zone is estimated to be 3 metres.

Five hundred metres west of the Sugar Vein occurrence several angular boulders of silicified metavolcanic rocks containing pyrite, arsenopyrite, molybdenite, galena and fuchite have been found. These boulders lie along a 320° trend which is subparallel to the Sugar Zone occurrence. Outcrop exposure in this area is poor but the trend of the boulder train corresponds to a linear magnetic signature.

On the west side of Dayohessarah Lake, Teck exploration, during drill testing of an airborne DIGEM anomaly, intersected a narrow zone of stratiform mineralization consisting of pyrite, pyrrhotite and minor amounts of sphalerite within felsic volcanic rocks. This hole returned 0.47% Zn over 2.8 feet. None of the assayed sections of core returned gold values.

#### EXPLORATION PROGRAM

Exploration work included linecutting, prospecting, soil geochemistry, geological mapping and ground geophysical magnetic and electromagnetic surveys. A total of 30.78 line kilometres of grid was cut to provide control for the surveys. The magnetic survey covered 26.5 line kilometres, the VLF-EM survey, 25.0 line kilometres, with a total of 945 soil samples and 28 rock samples

collected on the grid. All surveys were performed along a 100 metre line spacing, soil samples of the "B"-horizon were collected at a 25 metre spacing where possible. All samples were sent to Min-En laboratories in North Vancouver, B.C. for analysis.

### Geology

The Sullivan project appears to contain similar geology to that which hosts the Sugar Zone occurrence. The claims are underlain by a package of mafic volcanics and tuff with rare interflow sediments, which form a symmetrical syncline, the axis of which runs through the centre of Dayohessarah Lake. A number of mafic to ultramafic bodies intrude the package north of Dayohessarah Lake. The mafic volcanics exhibit varying degrees of dynamic metamorphism and alteration and are intruded by 1 to 5 metres wide felsite and porphyry dykes which are emplaced parallel to foliation. No significant alteration zones or structures were detected during the geological mapping. A total of 28 rock samples were collected (Figure 5).

### Soil Geochemistry

A total of 945 soil samples were collected from the grid area. Wherever possible, samples were taken of "B" horizon soil or humus if "B" was not available. Line locations and sample results are plotted on Figure 6.

A number of single station soil anomalies were indicated by the survey which are unexplained.

## GEOPHYSICS

### Magnetometer Survey

The ground magnetic survey was performed utilizing an EDA Omni IV and an Omni IV base station with a sampling interval of 15 seconds. Readings were taken throughout most of the grid area at a 12.5 metre spacing.

The survey has revealed an area of quite variable magnetic intensity. The western edge of the claims contains a weak to strong north-south linear feature (between 10W and 12W), nearly 2 kilometres in length (BL0 to 19S) with spot highs located along the feature centred at L2+00S, 10+00W and L7+00S, 11+75W. A sub-parallel liner feature is found between 7+00W to 10+00W on lines 13S to 19S. Mapping in the area of large linear features indicate mostly mafic metavolcanic rocks with minor Iron Formation noted near the centre of the high on L2+00S, 10+00W, and on L9+00S, 11+75W. The magnetic anomaly may well reflect a lens of iron formation. The smaller subparallel feature is largely swamp covered with minor outcrops of mica schist and siliceous metasedimentary and is also likely reflecting buried iron formation.

The north-central and central portions of the grid contain a number of semi-circular magnetic highs which all correspond to areas underlain by ultramafic intrusive rocks. The northeastern portion of the claims has limited coverage but appears to be a flatter response in a volcanic terrain, very limited mapping done in this area reveals a few outcrops of mafic volcanics. The southeastern portion of the grid contains a strongly anomalous circular feature on line 17S to 19S between 9+00E and 12+50E and is in a swampy area of no outcrop but is very similar in appearance to those anomalies caused by ultramafic intrusive rocks.

#### VLF-EM Survey

The electromagnetic VLF-EM survey was performed utilizing a Geonics EM-16 using Cutler and Annapolis stations. Readings were taken throughout most of the grid area at a 12.5 metre spacing.

The survey indicates two conductors on the western claim boundary areas that correspond to the linear magnetic features that are believed to represent iron formation. The smaller sub-parallel feature has a strong correlation of both the magnetic and electromagnetic surveys. The remaining conductors are scattered throughout the north central and central portions of the claims. A few weak northwesterly trends are present though most of the conductors coincide with areas of swamp.

## CONCLUSIONS AND RECOMMENDATIONS

The program was successful in outlining a number of single station soil anomalies. All soil anomalies should be prospected. If warranted, the anomalous areas should be trenched and mapped in detail in preparation for diamond drilling.

CERTIFICATE

I, Wesley D.T. Raven, of #108-1720 W. 12th Ave., Vancouver,  
British Columbia hereby certify:

1. I am a graduate of the University of British Columbia (1983) and hold a B.Sc. degree in geology.
2. I am presently retained as a consulting geologist with OreQuest Consultants Ltd. of #306-595 Howe Street, Vancouver, British Columbia.
3. I have been employed as an exploration geologist on a full time basis since 1983.
4. I am a Fellow of the Geological Association of Canada.
5. I am a Professional Geologist registered with the Association of Professional Engineers and Geoscientists of British Columbia.
6. The information contained in this report is based on information listed in the Bibliography.
7. I do not have or expect to receive direct or indirect interest in the Sullivan project nor in the securities of Golden Trio Minerals Ltd.
8. I consent to and authorize the use of the attached report and my name in the Company's Prospectus, Statement of Material Facts or other public document, providing the report is used in its entirety or any summary thereof is approved by the author.

DATED at Vancouver, British Columbia this 24th day of January, 1994

Wesley Raven  
Wesley D.T. Raven, P.Geo.

### **Certificate**

I, Graeme Fenton Scott of 3319 Sophia Street, Vancouver B.C.  
do Certify that:

1. I am a consulting geologist under contract with Golden Trio Minerals Inc.
2. I attended the University of Western Ontario and obtained a Bachelor of Science degree in Geological Sciences, 1985-1989
3. I have practiced my profession continuously since my graduation and have been employed in the mining industry since 1981.
4. I am a co-author of this report which is based on a thorough review of the texts and information contained in the bibliography of this report.
5. I supervised and participated in the work program discussed in this report.
7. I consent to and authorize the use of the proceeding report and my name in the Companies Statement of Material Facts or other public document, providing the report is used in it's entirety, or if a summary or excerpt of the report is to be used it has been approved by myself.

Dated at Vancouver, British Columbia this 24th day of January,

Credits you are claiming in this report may be cut back. In order to minimize the adverse effects of such deletions, please indicate from which claims you wish to prioritize the deletion of credits. Please mark (-) one of the following:

- Credits are to be cut back starting with the claim listed last, working backwards.  
 Credits are to be cut back equally over all claims contained in this report of work.  
 Credits are to be cut back as prioritized on the attached appendix.

cut back reserve first  
please

In event that you have not specified your choice of priority, option one will be implemented.

1: Examples of beneficial interest are unrecorded transfers, option agreements, memorandum of agreements, etc., with respect to the mining claims.

2: If work has been performed on patented or leased land, please complete the following:

My client the recorded holder had a beneficial interest in the patented/leased land at the time the work was performed.	Signature	Date

Dear Ms. Kurylo:

**RE: APPROVAL OF ASSESSMENT WORK SUBMITTED ON MINING CLAIMS  
SSM.1174321 ET AL. IN HAMBLETON TOWNSHIP.**

A Notice of Deficiency was not issued on these Reports of Work prior to the 90 day deemed approval date and as outlined in subsection 6(5) of the Mining Act Regulations this Report of Work is **deemed appproved** as of October 20, 1994. The Assessment credits are as listed on the original submission.

Please indicate this approval on the claim record sheets.

If you require further information, please contact Blair Kite at (705) 670-5861.
