INTRODUCTION

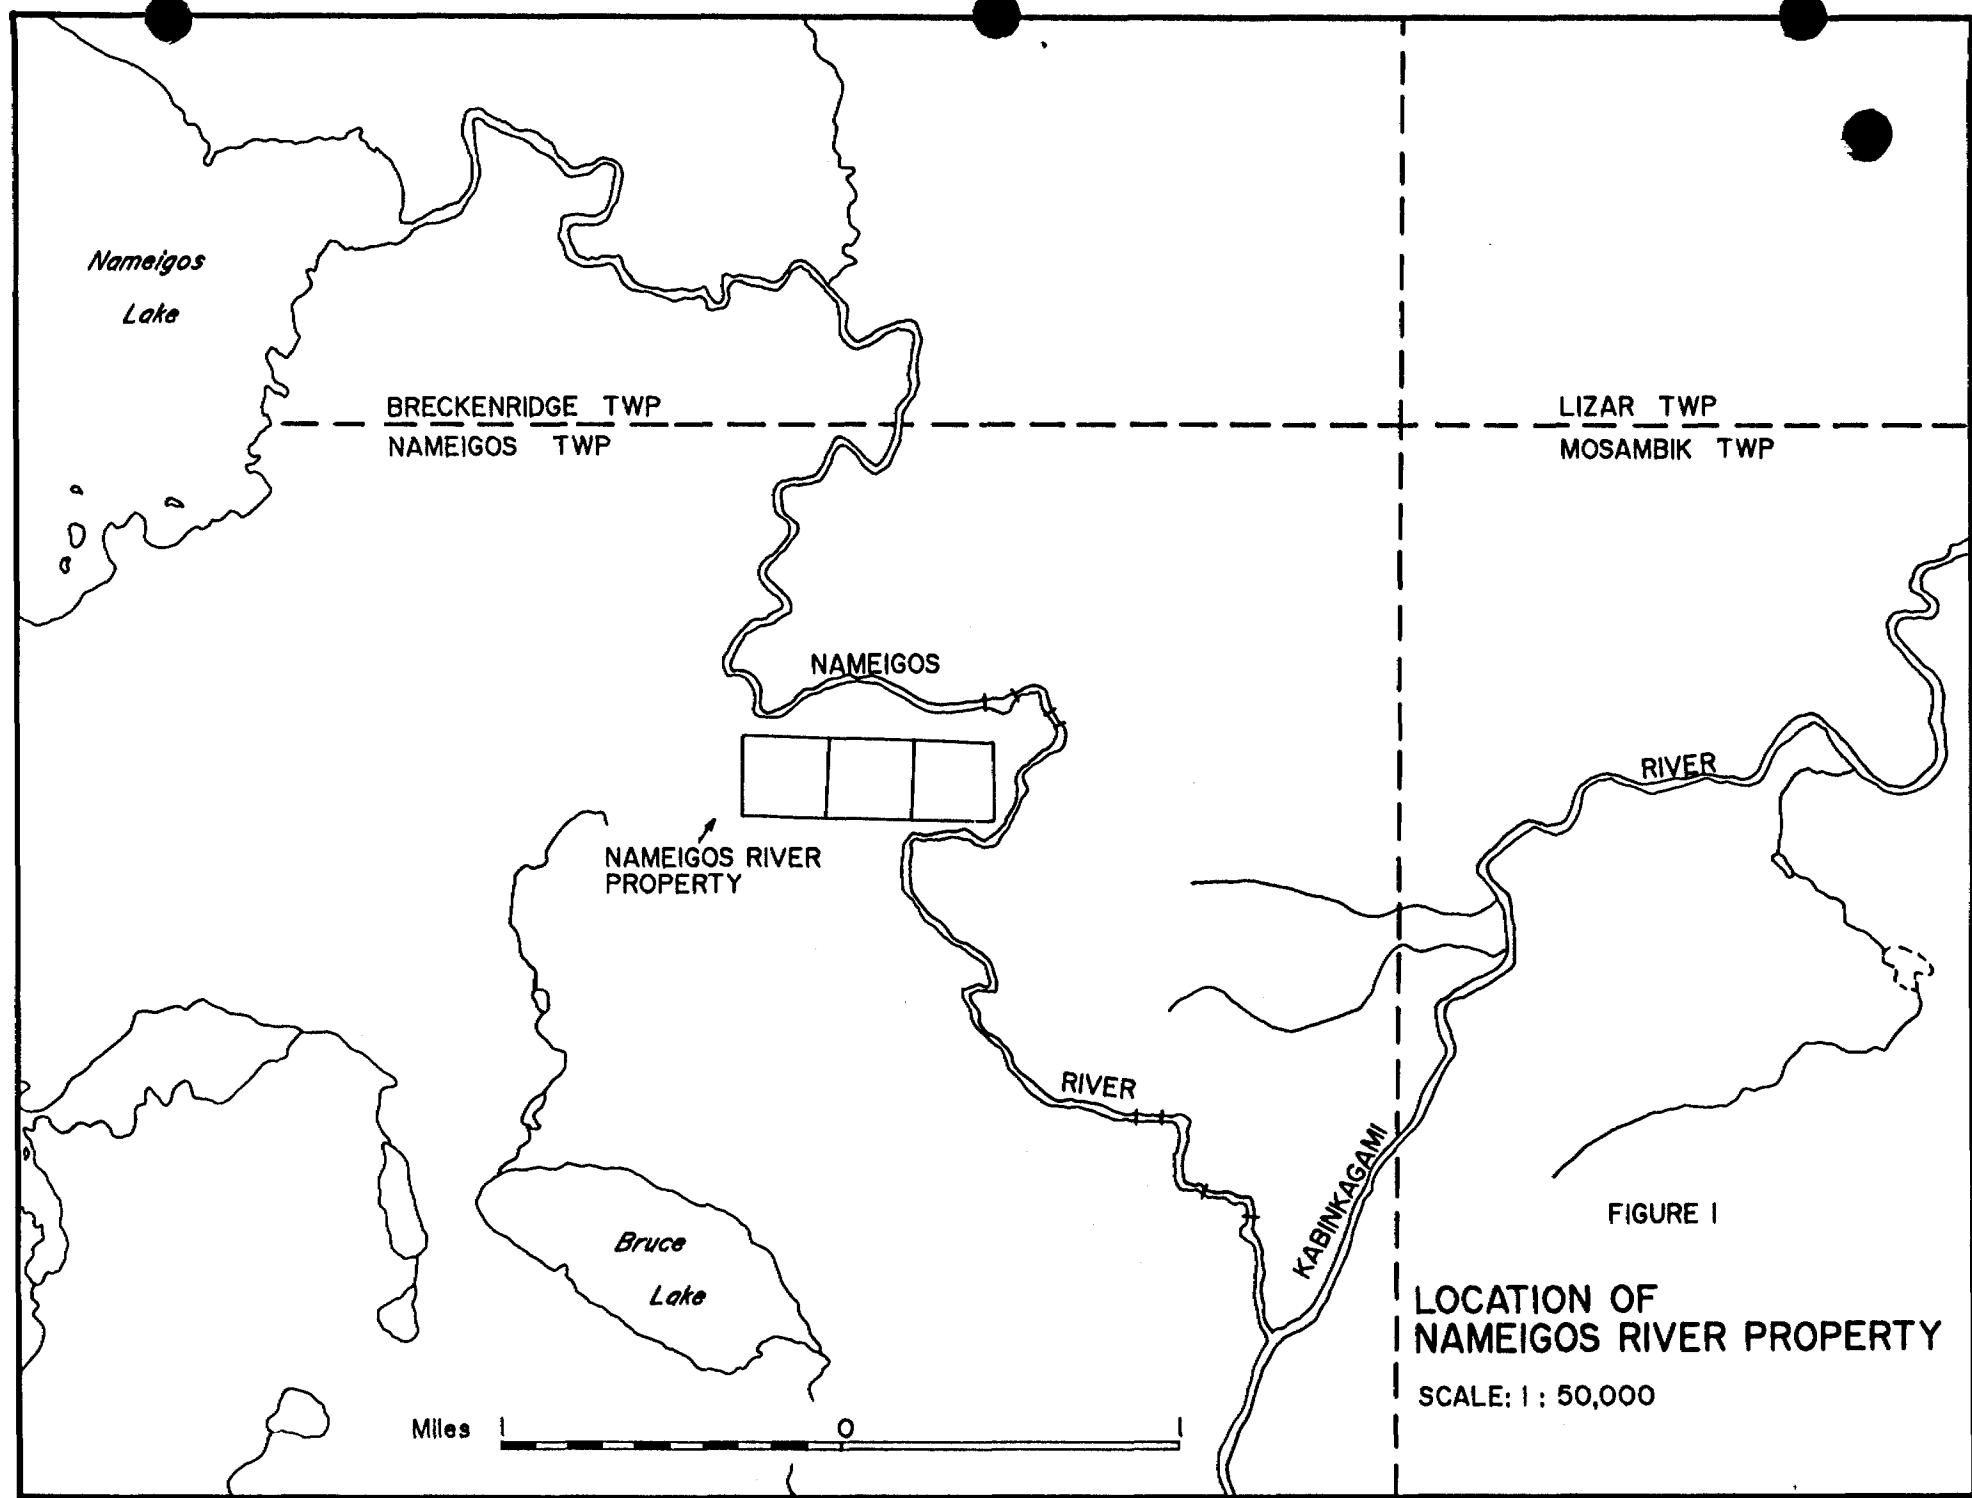

This report describes the geology, gold soil geochemistry, and gold lithogeochemistry of the Stenabaugh Occurrence area within the Nameigos River property. Field work was performed over an area 150 meters by 150 meters roughly centered upon trenches described as the Stenabaugh Occurrence by Siragusa (1978). Field work was performed from October 21, 1987 to October 23, 1987 inclusive. Forty-nine (49) upper B-Horizon soil samples and 13 rock chip samples from trenches were collected and analyzed for gold at Accurassay Laboratories Ltd. in Kirkland Lake, Ontario.

LOCATION AND ACCESS

The Nameigos River property is located along the Nameigos River south of Nameigos Lake, approximately 50 km east-northeast of White River and 90 km north of Wawa (Figure 1). The property lies within Nameigos township and falls within the boundaries of NTS map sheet 42C/15. Access is by air with charter aircraft available in Wawa and White River. A serviceable helicopter pad is located near the boundary between claims 943677 and 943678 approximately 165 meters south of the #1 post for 943678. Float-equipped fixed winged aircraft may land on either Nameigos Lake, about 3 km to the west of the property, or Bruce Lake, a small lake approximately 2 km south-southwest of the claims.

PROPERTY HISTORY

"This occurrence was discovered by J. E. Stenabaugh in the summer of 1935, was optioned by the Consolidated Mining and Smelting of Canada Ltd. (presently Cominco Ltd.) in January of 1936, and was abandoned in the month of June of the same year" (Siragusa, G. M., 1978). Eleven chip samples over 3 ft. intervals from a 38 ft. long trench in an extensively silicified and carbonatized zone, taken prior to the Cominco option, returned trace gold in four samples, 0.02 to 0.10 oz gold/ton in 5 samples, and 0.22 oz gold/ton in two samples, one 2 ft.

interval returned 0.24 oz gold/ton across 2 ft. (Cominco, 1937).

The 1987 field program located a clearing with a helicopter pad, a cut line at 290°, and a diamond drill hole in the vicinity of the Stenabaugh Occurrence trenches (Figure 2). There is no record of this activity in the MNDM assessment files in Sault Ste. Marie.

PROPERTY OWNERSHIP

Mining claims 943677, 943678, and 943679 in Nameigos Township, Sault Ste. Marie Mining Division, are currently held by Glen Prior of C412, 1290 Bancroft Drive, Sudbury, Ontario. The claims were recorded on December 19, 1986.

GEOLOGY

Siragusa (1978) shows the area of the Nameigos River property to be underlain primarily with mafic to intermediate metavolcanics, metamorphosed to fine to medium grained, foliated to massive amphibolites, and minor metasediments with a general east-west trend. Diabase dykes have a general northwest trend throughout the area.

Field mapping of the Stenabaugh Occurrence area was conducted over an area 150 meters by 150 meters along lines established with compass and hip-chain. The base line trends 290° and cross lines were established every 25 meters. The southern part of the grid area is underlain by felsic volcanics and quartz-eye felsic volcanics while the northern section is underlain primarily by amphibolite and garnetiferous amphibolite. The contact between these two units has a general east-west trend which appears to be somewhat concave towards the south (Figure 2). Both the felsic volcanics and the amphibolites are intruded by a feldspar porphyry. Foliations in all rock types trend northwesterly to westerly and dip steeply to the northeast and north. Six partly to totally filled in trenches occur within the grid area. (Figure 2).

GOLD LITHOGEOCHEMISTRY

Of the 13 chip samples taken from trenches within the Stenabaugh Occurrence area, only one returned greater than 5 parts/billion gold. Sample A55523, a 40 cm chip sample from trench B across felsic volcanics with weak biotite and sericite alteration and containing 1 to 2% very fine pyrrhotite, returned 25 ppb gold (Figure 2).

GOLD GEOCHEMISTRY OF SOILS

Upper B-Horizon soil samples were collected over an area 150 meters by 150 meters roughly centred upon the Stenabaugh Occurrence. Samples were collected every 25 meters along cross lines spaced 25 meters apart (Figure 3). The soil is composed primarily of grey silt and the upper B-Horizon is poorly defined. Samples were collected with a mattock and a small shovel and sample depth were generally between 10 and 30 cm below surface.

Of the 49 soil samples collected, 14 returned values of greater than 5 ppb gold. Values in excess of 5 ppb gold in soils, which may represent a weak anomaly, occur in two areas within the grid. The largest area, with values ranging from 6 to 17 ppb gold, corresponds roughly to the area of the feldspar porphyry and the felsic volcanics within the southeastern grid area. A second area consists of two weakly anomalous samples within felsic volcanics occurs near trench A.

ANALYTICAL PROCEDURES

The rock and soil analysis were performed by Accurassay Laboratories Ltd., Box 604, 3 Industrial Drive, Kirkland Lake, Ontario. Rock samples were crushed to -1/4" or better followed by pulvarization to -150 mesh or better. Gold analysis for both the rock and soil samples were performed by Fire Assay with a solvent extraction atomic absorption finish. The detection limit with this technique is 5 ppb gold.

SUMMARY AND CONCLUSIONS

The soil and rock geochemical program described in this report has failed to return any significant gold anomalies in the area of the Stenabaugh Occurrence. Any further work on the Nameigos River Property should be conducted at a grass-roots exploration stage. Further prospecting along the feldspar porphyry intrusion may be warranted as the overlying soils are weakly anomalous in gold.

Statement of Qualification

STATEMENT OF QUALIFICATION

I, Glen James Prior do hereby certify:

1. that I am a geologist and reside at C412-1290 Bancroft Drive, Sudbury, Ontario, P3B 1R5,
2. that I graduated from Laurentian University, Sudbury, Ontario, in 1982 with an Honours Bachelors of Science Degree in Geology and received a Master of Science Degree in Geology from the same institution in 1987,
3. that I have practiced my profession for the past seven field seasons,
4. that my report on the Soil and Rock Gold Geochemistry of the Stenabaugh Occurrence, Nameigos River Property, Nameigos Township, Sault Ste. Marie Mining Division, Ontario is based upon field work that I conducted and supervised on the Nameigos River Property during October of 1987.

Glen Prior, M.Sc.,
