BYRON'S VEIN

Byron's Vein is an iron formation containing in places abundant arsenopyrite and magnetite with minor pyrite in mafic volcanics. Previous work in 1993-94 showed good gold values in surface sampling i.e. 23.67g au. We blasted a 5' long trench in 8" pops as we didn't want to blow away too much material. Panning is very difficult because of the arsenopyrite present but the sludge from the rock drill showed a tail. An assay from a sample as shown with heavy arsenopyrite showed a $\frac{1}{2}$ oz. of gold. Two different companies have shown an interest in our showings so we will wait for their reactions as to an option agreement and further sampling by them.
