### INTRODUCTION

As a followup of 1995 work, during which encouraging gold values were obtained, a 1996 program of additional prospecting and bulldozer stripping along extensions of the 1995 gold occurrences was planned for 1996.

Exploration was conducted by P. Lassila (author of this report) between Aug. 12 and Sept. 06, 1996.

Prospecting for "high potential" stripping locations was first carried out between Aug. 12 and 19, 1996. Bull-dozer stripping with a D-6 Caterpillar Bulldozer was started on Aug. 19 but had to be terminated due to breakdown of the final drive in the bulldozer. Another bulldozer was not readily available in the Beardmore area and so the planned dozer work was not completed.

Prospecting was continued in several aeas (Map 1). A Scintrex MP-2 Protron Magnetometer was used to delineate and define the magnetic iron formation to the south. Detailed prospecting within these magnetic parameters resulted in the discovery of several magnetite-hematite bearing outcrops. Here again several weeks of delay was encountered due to a magnetometer breakdown and waiting for repairs to be completed.

During the work a total of 15 grab samples for assay were taken; 10 samples during prospecting and 5 samples from the dozer stripped trenches #20 and 21.

This report records the work and describes the results.

## LOCATION AND ACCESS

The property is located at Longitude 88\*03', Latitude 49\*41' (about 30 km north of Beardmore, Ontario) just east of Lake Nipigon. It lies in Dorthea Township. The east property boundary follows the north-south boundary between Dorothea Township and Sandra Township. It is also shown on the Poplar Point Claim Map, G-116.

The property may be reached by driving north from Highway 11 (at a point just east of Beardmore) along Highway 580 for about 8 km., then turn to the northeast along a gravel road until it crosses the Namewaminikan River on a Bailey Bridge. At the north end of the bridge, a dirt road leads some 7 km. to the southwest to the property area. Bulldozer roads lead you to the stripped areas on the property.

### PROPERTY

The property consists of four claims: 1196572, 1209233, 1209234 comprising 12 units, 3 units and 3 units, respectively, for a total of 18 units. Claim 1202232 (4 units) was staked on September 30, 1994 (recorded October 21, 1994) as an addition to the original three claim property. Ownership of all four claims is distributed 50% to F. Houghton and 50% to P. Lassila.

### PREVIOUS WORK

The general area has had considerable exploration activity for gold, copper and molybdenum, from the early 1930's to the late 1980's.

First recorded activity on the property itself, is found in Lairds 1936 O.D.M. report (p. 115) describing test pits on claim TB 19672 exposing "a rusty shear zone" 6 ft. wide with 6 in. to 12 in. of "siliceous vein matter" with "much arsenopyrite", yeilding 0.08 oz/t gold in a grab sample. These old Lawrence-McKirdy Syndicate pits were rediscovered by Houghton and Lassila after several days of searching. The

locations of the two old test pits was later bulldozer stripped and sampled for assay. It is marked as Tr. #6 on Map 2 in this report. Additional "showings" in this area, as a result of further stripping, returned several good assay results (between 0.1 and 0.2 oz/t Au.)

In 1988, Glen auden conducted mapping, IP surveying and diamond drilling. DDH No. VII (Line 36E, 5+50N) is of economic interest in that it intersected a 2m. thick quartz-carbonate vein with 5% pyrite and 10% arsenopyrite, from which two samples are reported to have returned 1800 ppb Au/30000 ppm As, and 1100 ppb Au/22000 ppm As. respectively. A 1994 search of the area in the vicinity of trenches 16, 17 and 18, resulted in the discovery of the drill hold location, perched on a flat area where a helicopter pad had been cut above a cliff face (Lassila 1995). A cursory examination of the nearby surface rock revealed only dark massive mafic flows. Bulldozer access to the projected surface area of the sulfide intersection appeared formidable and so no further work was completed at this time.

In 1994-1995 prospecting, bulldozer stripping and assay sampling was carried out at several locations in the property area (Lassila, 1994, 1995). This work resulted in the discovery of two zones with significant gold values. A carbonatized variable sheared alteration system with local quartz veins, pyrite and arsenopyrite (1994 trenches number 3, 5, 6 and 7) which returned gold values up to 0.174 oz/t. The second zone (Trench 10) returned values of 0.100, 0.220, 0.192 and 1.180 oz/t gold from small quartz-calcite veins in a volcanic shatter zone.

## WORK PROGRAM

The 1996 work program (partially discussed under "Introduction") was completed between Aug. 12 and Sept. 19, 1996. It consisted of the following work:

- 1) 5 days prospecting for "high potential" bulldozer stripping locations.
- 2) 2 days bulldozer stripping, mapping and sampling.
- 3) Several days of additional prospecting; some utilizing a magnetometer for defining parimeters of the "southlying" magnetic iron formation.

## Samples

A total of 15 grab samples taken for assay:

10 from prospecting locations

5 from Trenches 20 and 21

A pickup truck was used for daily transport between worksite and Beardmore.

## GEOLOGY AND MINERALIZATION

The general geology of the area is represented in the 1975 mapping of Dorothea, Sandra and Irwin Townships by W.O. Mackasey (Map 2294; see Fig. 3). Additional geological detail is shown in the 1988 Glen Auden mapping over the property areas. This data is available in the M.N.D.M. assessment files.

## Property Geology:

The property area is underlain by several geological formations or units. South to north they include:

- 1) Polymictic metaconglomerate in the southeast portion of the property.
- 2) Within the conglomerate a narrow (less than 50M.) band of cherty, magnetic iron formation which follows ENE along or close the north metaconglomerate contact with a northlying gabbroic intrusive.
- 3) A 100 m. to 200m. thick ENE trending dioritic to gabbroic intrusive, which extends across the south (at the west) to the central (at the east) portion of the property.
- 4) North of the mafic intrusive lies well fractured fine grain dacitic to rhyodacitic flows; commonly with pyrite fracture filling, and brittle felsic breccias, which host alteration systems within which the 1994 gold occurrence discoveries were made.
- 5) Medium grain, commonly pyritic, pinkish quartz diorite underlies the central west part of claim 1209234.
- 6) In the far west, fine grain mafic flows occur in the north part of claim 1209234 and south part of claim 1196572.

The 1996 prospecting results indicate that the "southlying" iron formation lies immediately south of a fine grained mafic east-west trending sill. The formation consists of a 35m thick section of distinctly finely banded magnetite, hematite and argilitic wacke siltstone to sandstone, striking at about  $070^*$  and dipping north at  $-60^*$ . Quartz veining with minor pyrite mineralization was found in greywacke at the south flank of iron formation. Of two samples taken the best assay return is 202 ppb, gold.

## Trench 20.

A well sheared moderately to intensely carbonatized (ankerite) diorite to quartz diorite is exposed in trench 20. Quartz veinlets, occassional blebs of chalcopyrite and a few thin pyrite-sphalerite seamlets are found in the deformed-altered diorite. Best value from here is 70ppb Au, 56 8 ppm Cu and 400 ppm Zn.

## Trench 21.

Foliated sericitized diorite with small subparrallel quartz veins or veinlets are exposed in the partly completed trench 21. Best sample assayed 405 ppb gold.

### General Comments:

The most significant 1996 prospecting result is the discovery of quartz veining float about 30 m. west of the 1995 trench # 10. From here 3 samples of 4 returned significant gold values of 14606 ppb Au, 2194 ppb Au and 2811 ppb Au respectively. Unfortunately planned bulldozer stripping of this location was not completed due to equipment breakdown problems.

## RECOMMENDATIONS

Bulldozer stripping, followed by detailed assay sampling, should be completed east of trench #10 along the gold-bearing quartz-calcite veined zone. Similar stripping and sampling should also be conducted east and west of the alteration zone in the area of the 1995 trenches 6, 7 and 8. A budget of \$5000 should be sufficient to complete this work.

) Jassila

## AUTHOR'S CERTIFICATION

- I, Pentti Lassila, do hereby certify as follows:
- 1) That I am an independent consulting geologist and that I reside at 68 Alberry Crescent, Ajax, Ontario.
- 2) That I am a graduate of the University of North Dakota, U.S.A., 1968, with the degree of Honours B.Sc. in Geology.
- 3) That I have been practising my profession in minerals exploration since 1968.
- 4) That I have completed the exploration work described in the report, completed the enclosed maps, am author of this report and am responsible for its contents.

P. Lassila

Status

Subject: Transaction Number(s): W9640.00645 Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

NOTE: This correspondence may affect the status of your mining lands. Please contact the Mining Recorder to determine the available options and the status of your claims.

If you have any questions regarding this correspondence, please contact Steve Beneteau by e-mail at beneteau\_s@torv05.ndm.gov.on.ca or by telephone at (705) 670-5855.

Yours sincerely,
