KONDRAT PROPERTY
(TB 862665)

SKALESKY

LOCATION AND ACCESS

The Skalesky Property is located in McComber Township approximately 160 kilometres northeast of Thunder Bay, 12 kilometres east northeast of Beardmore. The property can be accessed from the old Jackpine Siding of the C.N.R. The siding is 600 metres south of TransCanada Highway 11 on an old logging road. The Blackwater River can be crossed by bridge and an old logging road going south ends on small pond 400 metres north of the Skalesky claim TB 862665.

The Skalesky Property is within the NTS block 42E 12/NW at approximately 87 45' 55" Longitude and 49 34' 55" Latitude.

PROPERTY GEOLOGY

The Skalesky Property is underlain by an east west (250 degrees) trending sequence of mafic volcanics, sediments and banded lean oxide iron formation.

The main mineralized zones occur within banded lean carbonaceous iron formations and the best assays have been associated with arsenopyrite in quartz veins.

OBJECTIVE

The purpose of this visit to the Skalesky Property was to prospect (not map) the northern portion of the claim from the base line to the northern claim boundary. As the main showings have been thoroughly sampled by previous groups it was deemed unnecessary to resample the trenches.

Mentioned in the 1994 Compilation Report by J. C. Clark of Clark Geological Consulting is a magnetic trend parallel and north of the base line making this a priority target. This zone could host lean iron formations similar to the main showings

PROSPECTING RESULTS

Prospecting was done on May 13 and May 14, 2003. The number 1 Post of TB 862665 was located and flagged. The main showing south of the # 1 Post as it adjoins the claim to the east was visited, providing information about the occurrence. From this point traverses were made north examining all outcrops and digging in the overburden to locate hidden bedrock. Locating bedrock was difficult as there balsam blow-down obscured outcrops.

Mafic volcanics predominate with a wedge of Greywake in the northeast section of the claim. Outcrop is scarce in the northwest section of the claim.

A chlorite schist striking 252 degrees and vertically dipping was located 50 metres south and 30 metres west of the # 1 Post of TB 852665. This is in the vicinity of the magnetic anomaly as outlined by geophysics (Clark 1994). The schist consists of two potential zones, one being 30 centimetres wide and 1 metre in length (sample 001) the other 50 centimetres to the north of the first zone (sample 002) and is covered but it is inferred to be there due to the very rusty soil. This zone was traced using rusty soil as an indicator for 25 – 30 metres to the west. No other outcrop from this zone was noticed along strike for 150 metres at which point overburden is extensive.

Sample 001

Chlorite schist with sugary textured rusty quartz. Minor pyrite was noticed and a slight magnetic attraction was evident.

Sample 002

Angular rusty chlorite schist with sugar quartz. Not bedrock.

Sample 003

40 metres east of sample location 001 a slightly magnetic lean carbonaceous iron formation striking 250 degrees and dipping vertically was uncovered.

Assays results conclude that all three samples have negligible amounts of gold. (See Enclosure)

No other zones of interest were uncovered in the area prospected. Rocks were massive and no sulphides were noticed.

Dear Sir or Madam

Subject: Approval of Assessment Work

We have approved your Assessment Work Submission with the above noted Transaction Number(s). The attached Work Report Summary indicates the results of the approval.

At the discretion of the Ministry, the assessment work performed on the mining lands noted in this work report may be subject to inspection and/or investigation at any time.

If you have any question regarding this correspondence, please contact STEVEN BENETEAU by email at steve.beneteau@ndm.gov.on.ca or by phone at (705) 670-5855.

Yours Sincerely,

Ron Gashinski
Senior Manager, Mining Lands Section
