1 INTRODUCTION

At the request of Mr. Ian Camphbell of STARCORE RESOURCES LTD., VAL D'OR SAGAX INC. has performed an induced polarization/resistivity survey over the DOGPAW property (NTS 52F/5) (figure 1). The object of this survey is to define, if possible, promising anomalies for the search of economic mineralization on this property.

After a brief description of the methods employed, we discuss the results obtained and attempt to interpret them in light of the available geological and geophysical information. Based on the results of this interpretation, we then establish what further work, if any, should be performed.

2 THE DOGPAW PROPERTY

2.1 Location and Access

The property is located approximately 60 kilometres south-east of Kenora in the Kenora District, province of Ontario (NTS 52F/5) (figure 1). The access is possible first by the Highway #71 as far as 10 kilometres south of Sioux Narrows, then by the Cameron road for a distance of approximately 11 kilometres and finally by snowmobile trails.

2.2 Survey Grid

Two blocks of lines, constituting the northwest and the southwest extension of an pre-existing grid, were covered by the survey (figure 2). The north-west block, named Gauthier Occurrence, consists of lines 6+00E, 7+00E and 8+00E cut north-south between 28+00N and 36+00N and a tie line (TL 34+00W) striking east-west. The southwest block, named Houston Extension, consists of five (5) lines (L11+00E, L13+00E, L15+00E, L17+00E and L19+00E) striking north-south. The major part of this grid is on the Dowpaw lake. All these lines are chained every 25 metres.

2.3 Description

The property is held by STARCORE RESOURCES LTD. and the claims partially and totally covered by the present field works are shown on figure 2.

Figure 1: General location

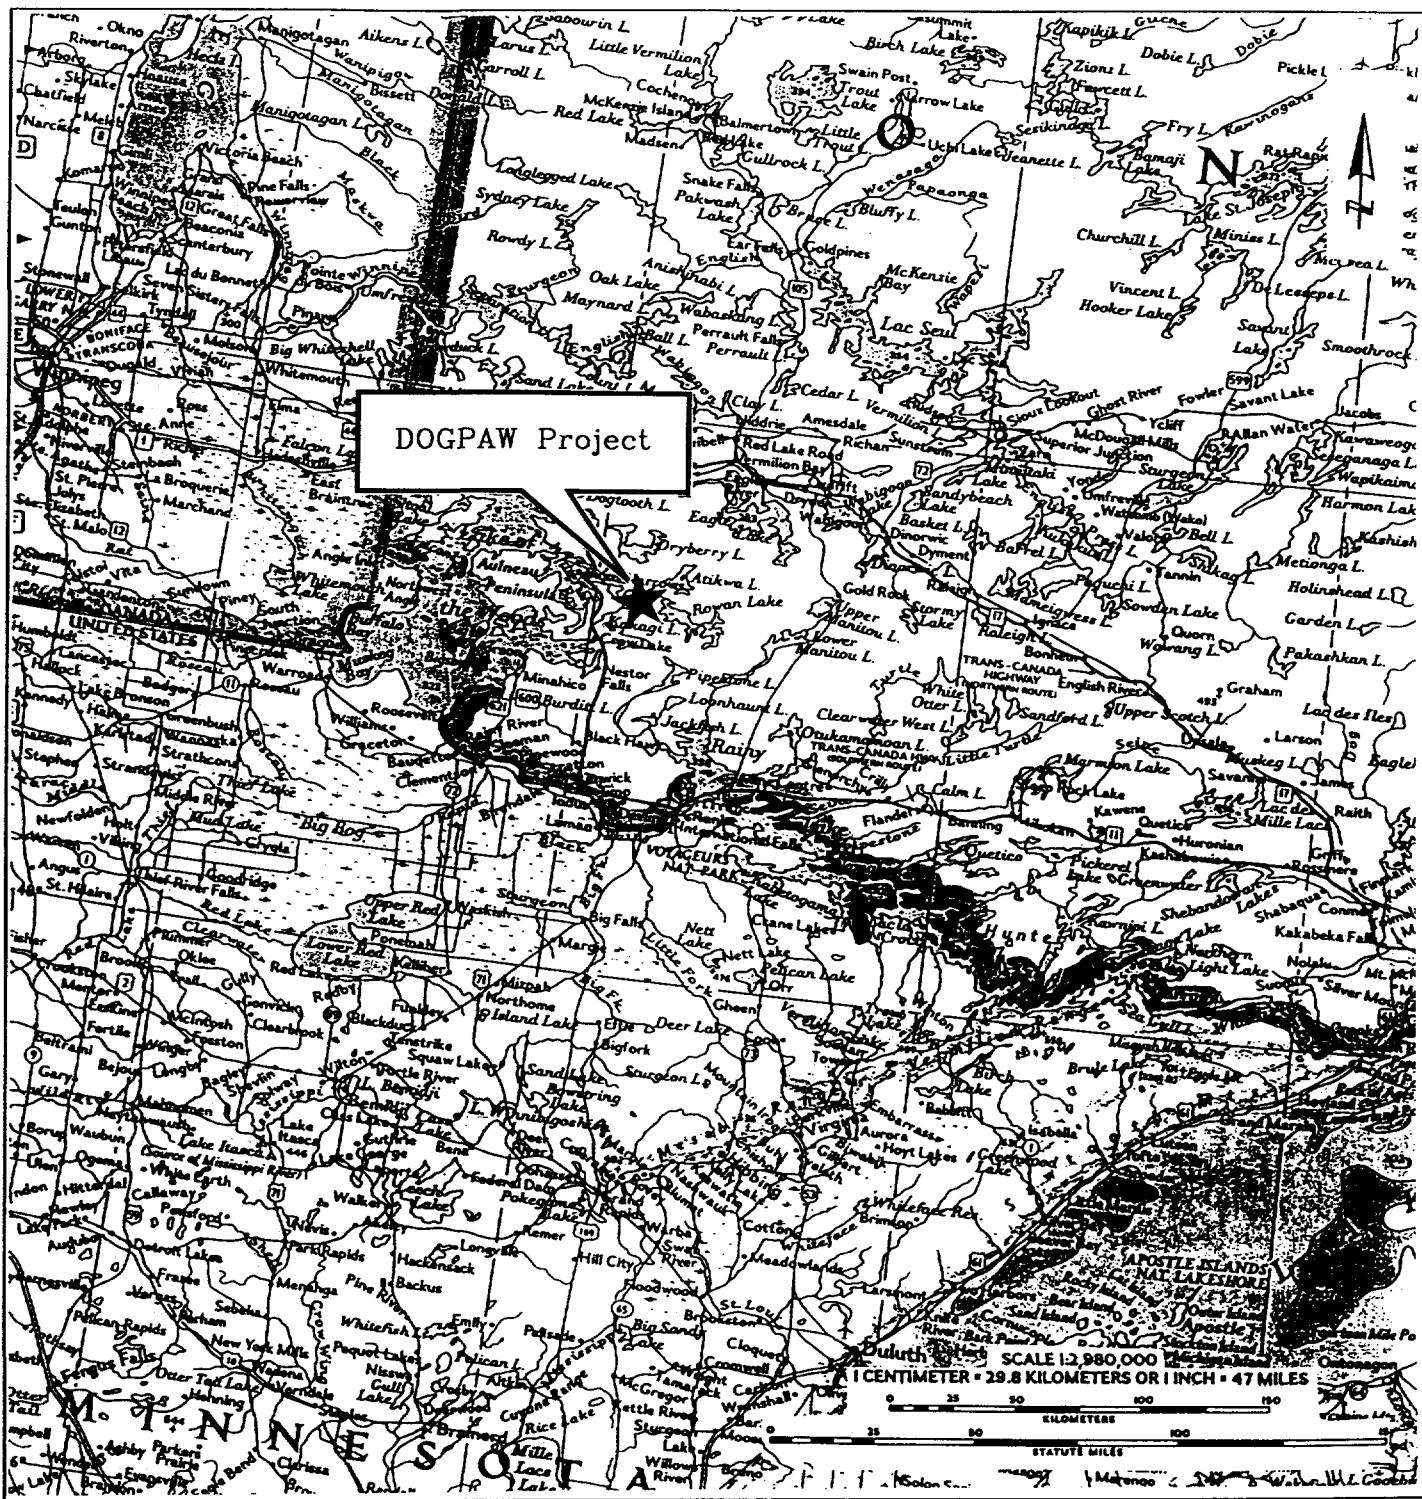

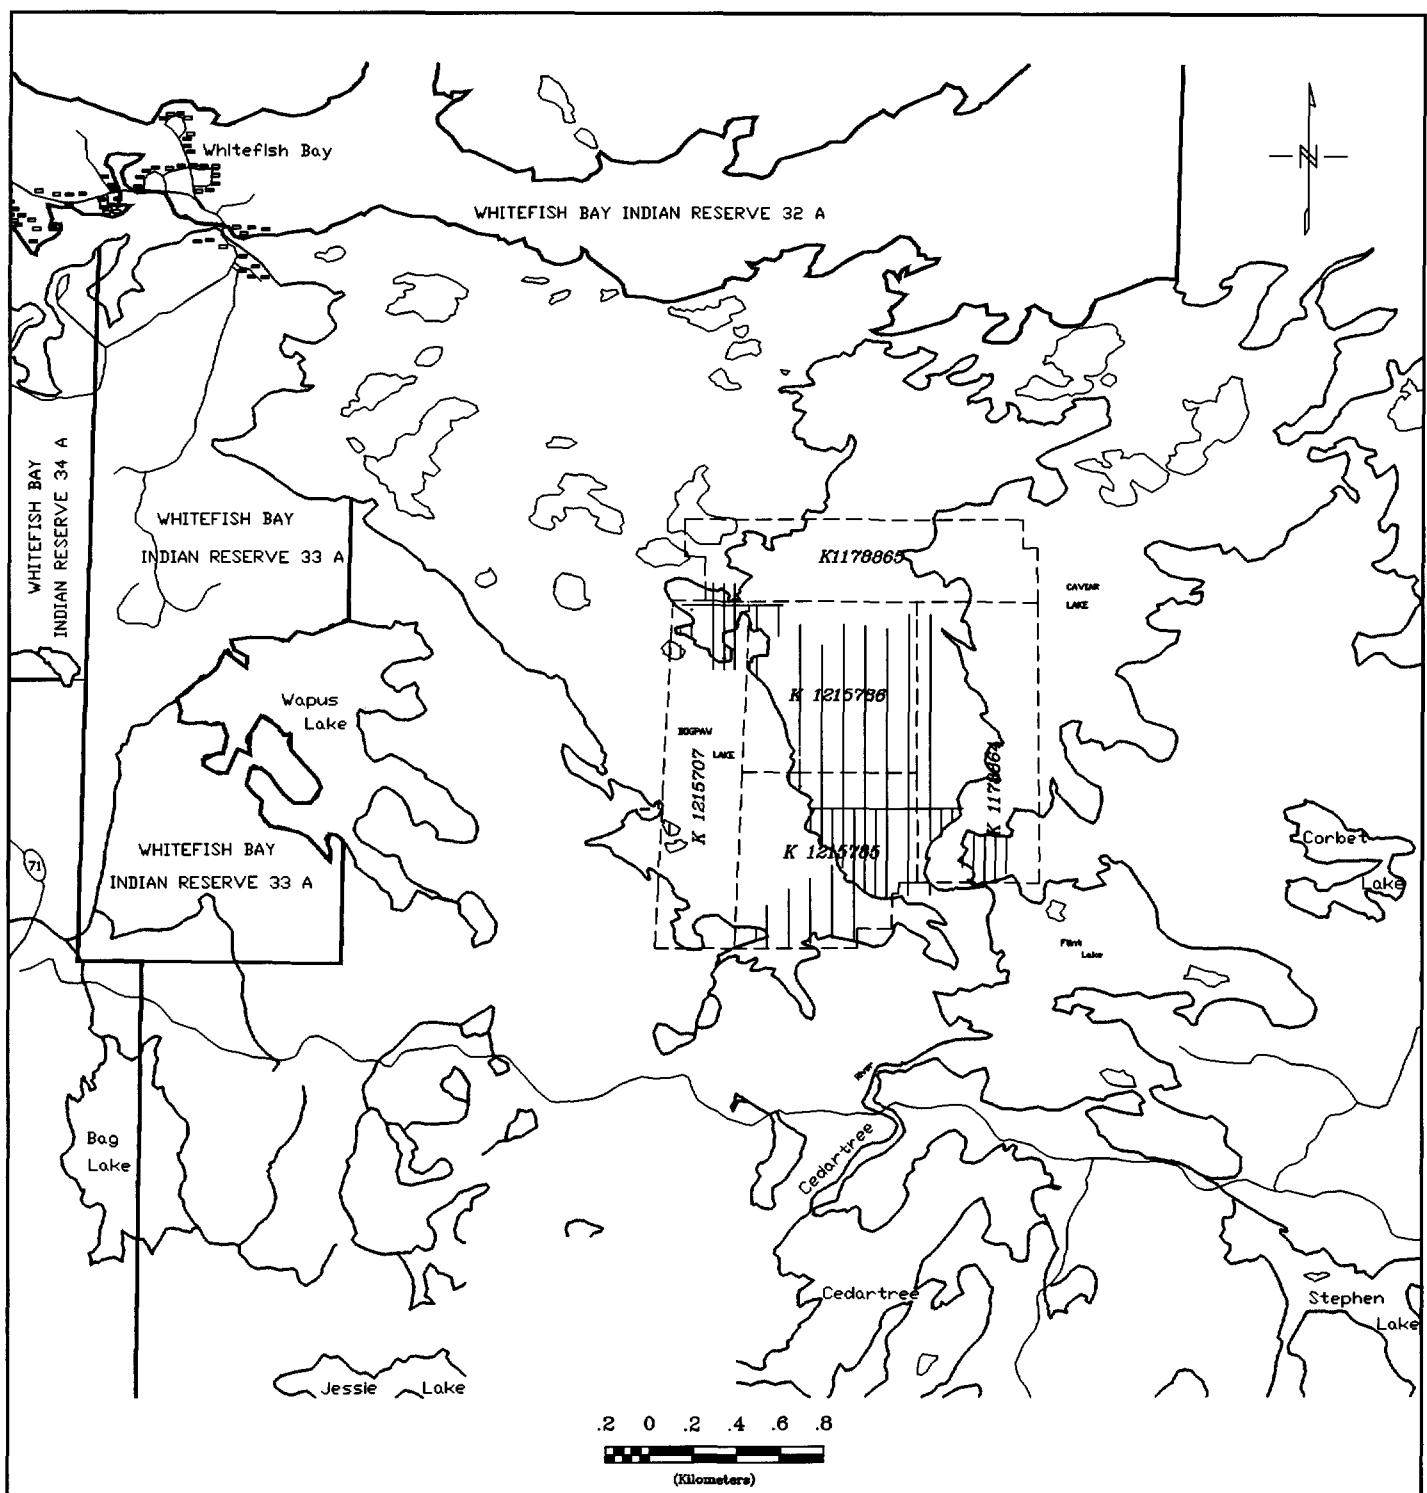

Figure 2: Index of claims and survey area

3 TECHNICAL SPECIFICATIONS OF THE SURVEY

3.1 Generalities

A total of 5.3 kilometres of induced polarization/resistivity were completed from March 9 to March 12, 1998 over the DOGPAW property. This survey was performed under the direction of Mr. Paul Melancon with the help of four assistants.

3.2 Electrode Array

The dipole-dipole array (figure 3) was used for the investigation of all IP lines performed on the DOGPAW property. The nominal spacing a between the electrodes was set at 25 metres and separation factor n between the transmitting and the potential dipoles ranged from 1 to 6.

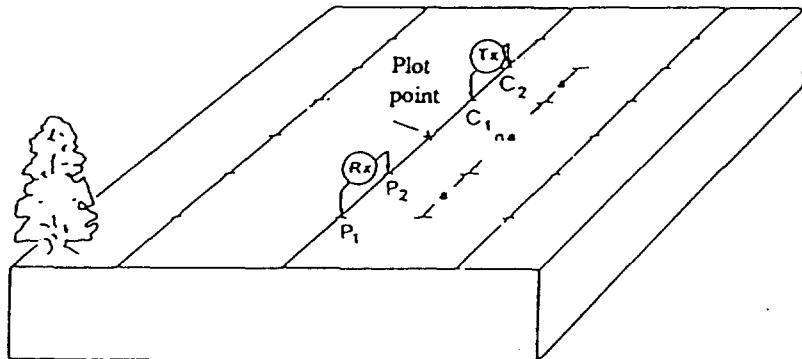

Figure 3: The dipole-dipole array

3.3 Equipment

The induced polarization equipment employed consisted of a transmitting device as well as a receiving device, both working in pulse current mode. A GDD transmitter model TX-11 supplied by a 1.4 kW generator was used to provide a stable current. Stainless steel electrodes were used to provide contact with the ground for the transmission of current as well as the reception of the signal. The current was transmitted with a period of 8 seconds and an effective cycle of 50% (figure 4).

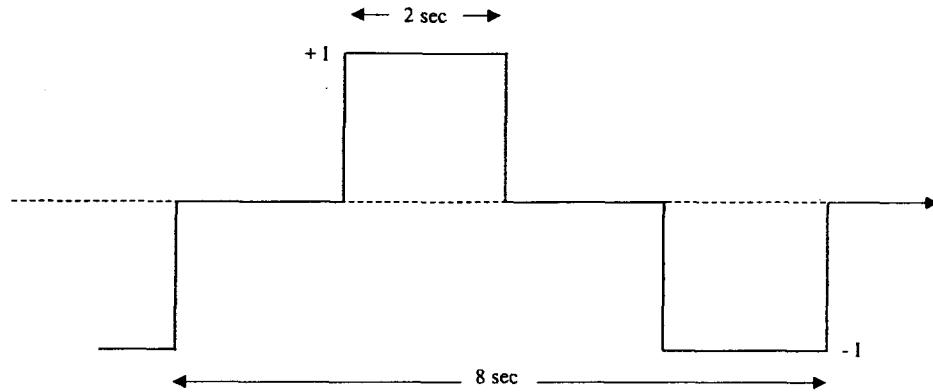

Figure 4: The transmitted signal at C_1-C_2

Primary voltage V_p and apparent chargeability M_a were measured with an ELREC-6+ IP receiver manufactured by Iris Instruments Ltd. The integration of the transient voltage after current shut-off was performed over twenty windows (M_1 to M_{20}) of equal duration of 80 ms each (figure 5). Those twenty parameters are automatically normalised in relation with the decay rate of the transitory voltage due to a pure electrode polarization effect. Therefore, all parasitic contribution to the signal can be filtered by observing the deviation between the values M_1 to M_{20} read at the receiver.

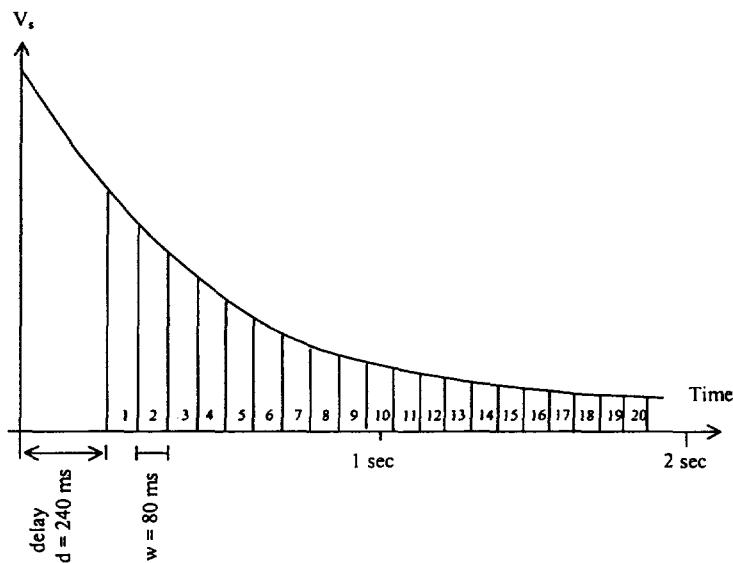

Figure 5 : ELREC-6+ Timing for the slices of an IP decay curve

3.4 IP Survey Parameters Calculations

Apparent resistivity was determined using the following equation:

$$\rho_a = \pi \cdot \frac{V_p}{I} \cdot n \cdot (n+1) \cdot (n+2) \cdot a \quad (\text{in } \Omega \cdot \text{m})$$

Where

a = dipole length (25 m)
 n = dipole separation factor
 V_p = primary voltage (mV)
 I = injected current (mA)

Chargeability M_a is expressed in mV/V and is the weighted average of at least 10 of the partial apparent chargeability windows (M_1 to M_{20}). Windows that do not fit the general polarization curve are rejected.

3.5 True-Depth Section Imaging

To facilitate quantitative interpretation, an automatic 2D inversion software of resistivity/induced polarization data sets, developed by VAL D'OR SAGAX INC., has been used with the data from the DOGPAW property. With this software, no initial guess (starting model) needs to be defined by the user. The subsoil is divided in small cells and a spatial deconvolution of raw data is applied. The result is a smooth model representing the conductive, resistive and polarizable bodies distribution on true-depth sections. The resulting image represents a model of all possible solutions, highlighting the most probable ones. However, this process does not recover intrinsic resistivity and chargeability unless the source is very wide.

Imaging cannot create information that is not in the raw data set, i.e. the limitations of the technique and array used will still prevail. For instance, resolution at depth is very limited and subhorizontal structures are difficult to resolve. However, noise is efficiently rejected, near-surface effects are easily identified and complex responses such as wide units, two sources next to each other, vertical or inclined geological contacts are well resolved.

3.6 Quality Control

The apparent resistivity error is essentially that of the nominal spacing a between the electrodes, approximately 3% in all. The average error on apparent chargeability measurements, which represent the average of 6 to 17 measuring cycles, is 0.32 mV/V.

4 RESULTS AND INTERPRETATION

4.1 Data presentation

The results of the induced polarization survey are presented in the form of pseudosections, *image2D* true-depth sections of the apparent resistivity and apparent chargeability at a scale of 1 : 2500. Position of the interpreted IP anomalies has been included on the pseudosections.

The results are also presented in the form of *image2D* apparent resistivity and apparent chargeability maps at 50 m depth level (98-N311-4.2 and 98-N311-4.3). Colour versions of *image2D* apparent resistivity and apparent chargeability maps at 50 m depth level are submitted separately. The principal interpreted anomalous IP zones have been reproduced on the geophysical interpretation map (98-N311-4.0). All maps are presented at a 1 : 5000 scale.

4.2 Interpretation

The apparent resistivity values measured ranged from 12 to about 53 000 $\Omega\cdot\text{m}$ on the surveyed areas while the apparent chargeability readings vary between less than 0 to 7.7 mV/V. The lowest resistivity and chargeability values, which probably correspond with the deeper spots of the lake, suggest an inefficient bedrock investigation at these places.

The present survey delineated six (6) polarizable anomalies labelled IP-1, IP-2, IP-2A, IP-10, IP-11 and IP-12 and a few isolated anomalies, which were not marked. Anomalies IP-10, IP-11 and IP-12, associated with resistivity highs, are probably principally (partially for IP-12) induced by a bedrock uplift, the bedrock being more resistive and polarizable than the overburden. All the other anomalies defined by the survey don't show significant resistivity contrasts and can be caused by the presence of disseminated mineralization, the amount of mineralization corresponding to the degree of polarizability. Therefore, anomaly IP-2, the most polarizable, likely represents a greater amount of mineralization while anomaly IP-1, the less polarizable, is probably caused by a marginal quantity of mineralization.

Table 1 describes all the physical characteristics of the IP anomalies.

Table 1 : Physical characteristics of IP anomalies

Name	Location		Chargeability Contrast	Resistivity Contrast	Description	Priority
	Line	Station				
IP-1	13+00E 15+00E	3+62.5N 3+50N	1 ?		Weakly polarizable anomaly. The source seems to be shallow.	4
IP-2	15+00E	North end	1		Weakly to moderately polarizable anomaly incompletely defined eastward and westward. This anomaly is probably associated with IP-2A. A D.D.H. target is recommended on line 17+00E (table 2, section 5).	1
	17+00E	8+25N	2			
	19+00E	8+12.5N	2			
IP-2A	17+00E 19+00E	7+56N 7+25N	1 1		Weakly polarizable anomaly incompletely defined eastward. This anomaly is probably associated with IP-2A. Interest to be confirmed.	2
IP-10	6+00E	33+06N	1	↑	Weakly to moderately polarizable anomaly associated with a resistivity high. This anomaly, incompletely defined eastward and westward, is probably principally induced by a bedrock uplift.	4
	7+00E	32+62.5N	2	↑		
	8+00E	32+44N	1	↑		
IP-11	6+00E 7+00E	29+12.5N 29+44N	? 2	↑ ↑	Weakly to moderately polarizable anomaly associated with a resistivity high. This anomaly, incompletely defined westward, is probably principally induced by a bedrock uplift.	4

Name	Location		Chargeability Contrast	Resistivity Contrast	Description	Priority
	Line	Station				
IP-12	7+00E 8+00E	North end 34+87.5N	? ?	↑	Very weakly polarizable anomaly, partially associated with a resistivity high, incompletely defined south-eastward and north-westward. Interest to be confirmed.	3

Note : The location of the anomaly is based on the chargeability contrast.

Legend :	Chargeability	Resistivity
	Increase	Increase
? = marginal	↑ = resistive	↑↑ = very resistive
1 = weak	Decrease	↓ = conductive
2 = moderate		↓↓ = very conductive
3 = strong		
4 = very strong		

5 CONCLUSION AND RECOMMENDATIONS

The induced polarization/resistivity survey carried out on the DOGPAW property allowed the detection of six (6) anomalies labelled IP-1, IP-2, IP-2A and IP-10 to IP-12, and of some isolated anomalies which were not labelled.

Three of these anomalies (IP-10 to IP-12) seem to be induced, at least partially, by a bedrock uplift while the other anomalies are probably caused by the presence of variable amount of disseminated mineralization. However, anomaly IP-2 which is more polarizable can represent a greater amount of mineralization.

Therefore, a D.D.H. is recommended on anomaly IP-2 to verify the nature of the associated mineralization (table 2). If the results of this eventual hole are positive, an additional IP coverage would be recommended too, to better define this anomaly.

Table 2 : Follow-up work to be completed on the DOGPAW property

Anomaly	Type of work recommended	Priority
IP-2	A Diamond Drill hole is recommended: D.D.H. target {L: 17+00E, S: 8+25N, D: -75 m} (note 1)	1
IP-2	Additional IP coverage: East of line 19+00E and west of line 15+00E to better defined the anomaly (note 2).	2

Note 1: The D.D.H. target is indicated, not the collar location.

Note 2: Proceed with this additional IP coverage if the D.D.H. results are promising. We recommend to use a more penetrating array, like pole-dipole or dipole-dipole with a spacing a of 50 metres, for the achievement of an eventual additional IP survey on the lake.

Respectfully submitted,

VAL D'OR SAGAX INC.

Calculations of Filing Discounts:

1. Work filed within two years of performance is claimed at 100% of the above Total Value of Assessment Work.
 2. If work is filed after two years and up to five years after performance, it can only be claimed at 50% of the Total Value of Assessment Work. If this situation applies to your claims, use the calculation below:

TOTAL VALUE OF ASSESSMENT WORK

x 0.50 =

Total \$ value of worked claimed.

Note:

- Work older than 5 years is not eligible for credit.
 - A recorded holder may be required to verify expenditures claimed in this statement of costs within 45 days of a request for verification and/or correction/clarification. If verification and/or correction/clarification is not made, the Minister may reject all or part of the assessment work submitted.

Certification verifying costs:

I, Karen Rees
(please print full name), do hereby certify, that the amounts shown are as accurate as may reasonably be determined and the costs were incurred while conducting assessment work on the lands indicated on the accompanying Declaration of Work form as agent
(recorded holder, agent, or state company position with signing authority) I am authorized to make this certification.

6. Instructions for cutting back credits that are not approved GEOSCIENCE ASSESSMENT OFFICE

Some of the credits claimed in this declaration may be cut back. Please check (✓) in the boxes below to show how you wish to prioritize the deletion of credits:

- 1. Credits are to be cut back from the Bank first, followed by option 2 or 3 or 4 as indicated.
- 2. Credits are to be cut back starting with the claims listed last, working backwards; or
- 3. Credits are to be cut back equally over all claims listed in this declaration; or
- 4. Credits are to be cut back as prioritized on the attached appendix or as follows (describe):

Note: If you have not indicated how your credits are to be deleted, credits will be cut back from the Bank first, followed by option number 2 if necessary.

Dear Sir or Madam:

Submission Number: 2.19225

Status

Subject: Transaction Number(s): W9910.00057 Deemed Approval

We have reviewed your Assessment Work submission with the above noted Transaction Number(s). The attached summary page(s) indicate the results of the review. WE RECOMMEND YOU READ THIS SUMMARY FOR THE DETAILS PERTAINING TO YOUR ASSESSMENT WORK.

If the status for a transaction is a 45 Day Notice, the summary will outline the reasons for the notice, and any steps you can take to remedy deficiencies. The 90-day deemed approval provision, subsection 6(7) of the Assessment Work Regulation, will no longer be in effect for assessment work which has received a 45 Day Notice. Allowable changes to your credit distribution can be made by contacting the Geoscience Assessment Office within this 45 Day period, otherwise assessment credit will be cut back and distributed as outlined in Section #6 of the Declaration of Assessment work form.

Please note any revisions must be submitted in DUPLICATE to the Geoscience Assessment Office, by the response date on the summary.

If you have any questions regarding this correspondence, please contact Steve Beneteau by e-mail at steve.beneteau@ndm.gov.on.ca or by telephone at (705) 670-5855.

Yours sincerely,

A handwritten signature in black ink that reads "Blair Kite".
