INTRODUCTION

This report summarizes exploration activities conducted on the Beartrack Claim Group during the period of September through to December 31, 1991.

The exploration program is at an early stage and on going through the winter of 1991 - 1992. This report is an interim report therefore, only summarizes the activities. Definitive conclusions and recommendations are not possible at this point in time.

Independent Exploration Services Ltd. of Winnipeg conducted exploration on behalf of Champion Bear Resources Ltd. Mr. A.P. Pryslak participated as an independent geological consultant to Champion Bear Resources Ltd.

DESCRIPTION, LOCATION AND ACCESS TO PROPERTY

The Beartrack Lake Property is comprised of 34 claims (133 claim units).

Twenty-two claims (23 claim units) are held under option agreements with Bob Fairservice et al. These claims are recorded under the following claims No: K's 1085111, 1085112, 1133313, 1133443, 1133507 to 1133521 inclusive and 1144900.

Twelve claims (112 claim units) were staked on behalf of Champion Bear Resources Ltd.

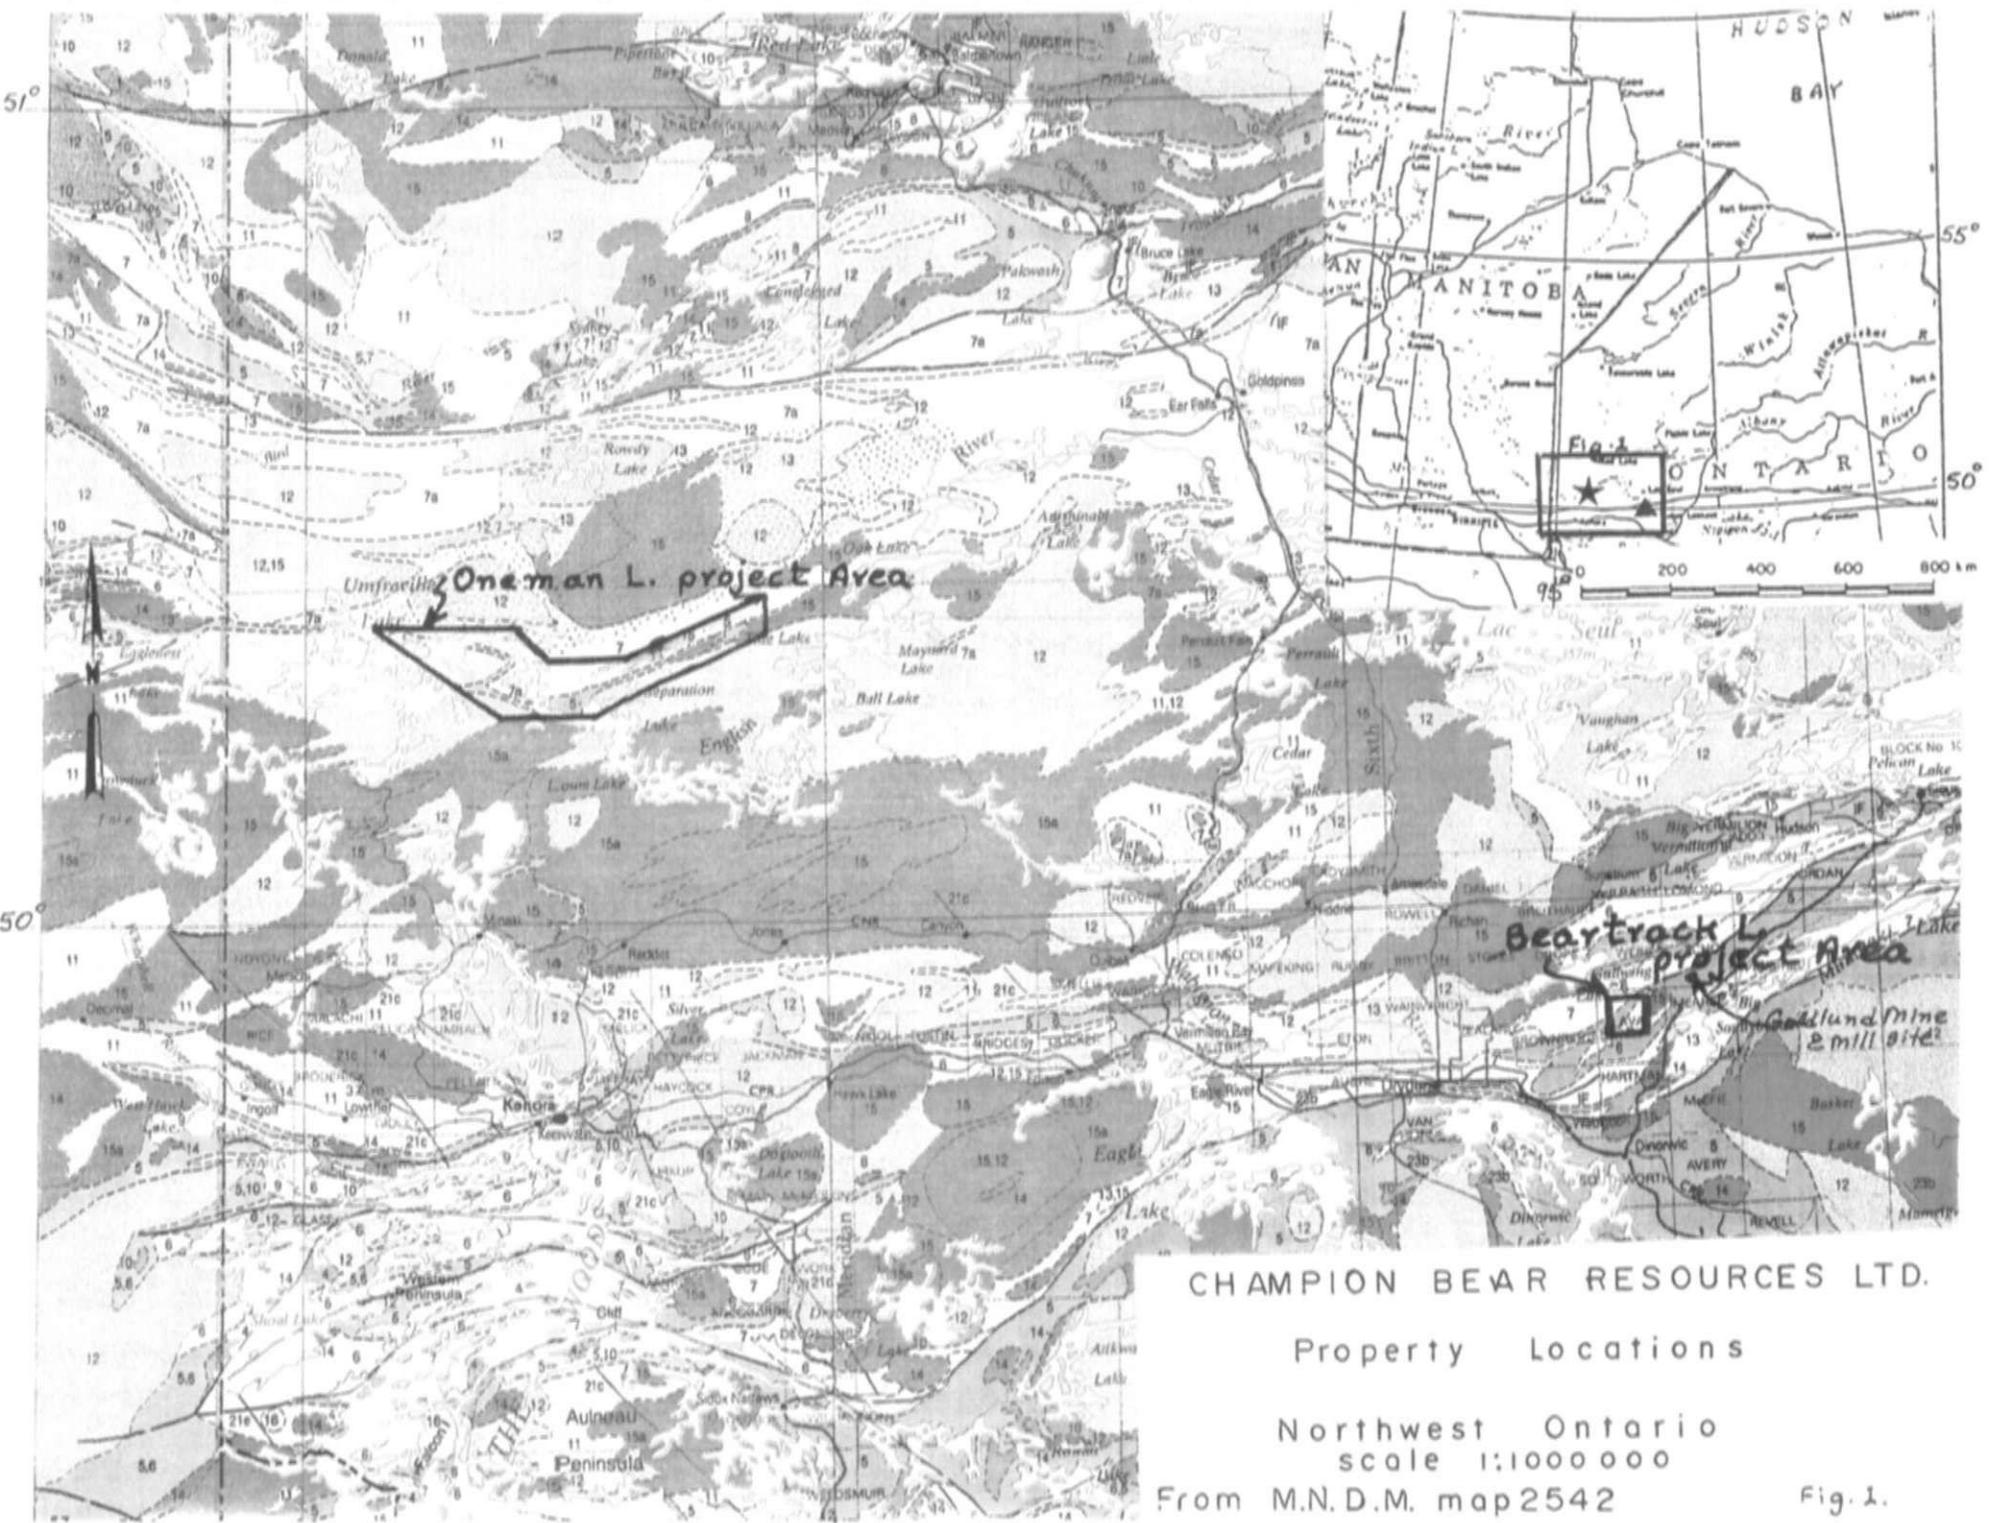

These claims are recorded under the following claim No: K's 1161172 to 1161185 inclusive.

Presently all 34 claims are recorded in the name of Champion Bear Resources Ltd.; 3805 - 7A Street S.W.; Calgary, Alberta; T2T 2Y8. Licence No: T5146.

All 34 unpatented mining claims are located in Laval Twp., claim map No: G-0823, of the Kenora Mining Division (Figure 1).

The property is centered approximately 25 km due east of the town of Dryden, Ontario.

Access to the property is via the Ghost Lake-Gullwing Lake Road with trends east from the Dryden Airport. Access is also possible via a logging road from Highway 72, (Sioux Lookout Road).

PROPERTY OWNERSHIP

Presently all 34 unpatented mining claims listed above are recorded, 100%, in the name of Champion Bear Resources Ltd. Licence No: T 5146.

PREVIOUS WORK

The main showing is known as the Graham Bousquet South Showing. Work was carried out in 1950-51, including diamond drilling. However, the data was misfiled at the government assessment office and no work has been carried out since that time. The Northern Miner reports values of 0.76 oz/t gold over 2.4 feet and 0.18 oz/t gold over 2.0 feet of core from the drilling program.

Two recent efforts of geological mapping by personnel of the Ontario Geological Survey are available. The structural and economic aspects of the area are illustrated on map P.3163, the Sandybeach Lake area by L.B. Charlton (1987) and the general geology is given in report 272 on "The Precambrian Geology of Laval and Hartman Townships" by B.R. Berger, 1990. Map No: 2534 accompanies this report.

Prospecting reports by Fairservice, Glatz and Noranda are also available in the assessment office.

GENERAL GEOLOGY

A gabbroic body has been intruded along the contact of mafic and intermediate volcanics. NE trending shears within most lithological units have been reported to carry low gold values. The high grade values appear within easterly trending fractures (70° to 120°). These are more tensional features with which alteration and high grade gold values are associated within the area. Although the zones identified to date are generally less than one meter in width, the potential for a much wider zone is considered to be very good. A review of airborne magnetic data would support this east to southeast structural trend through the disruption of magnetic contours.

SUMMARY OF WORK

LINE CUTTING

In the late summer-early fall of 1991 a grid was established covering both Bousquet North and South Showings (Figure 2). After some preliminary examinations of the area it was decided to expand the coverage in the area. As the two sections of grid cut on the north and south side of Beartrack Lake did not jibe well, a new grid was established for reference purposes for further work (Figure 3).

The results presented to date are tied into the "Old Grid".

GEOLOGY AND PROSPECTING

Reconnaissance geology was carried out by an Independent Exploration Services Ltd., company geologist along with a field assistant. Work, including mapping, sampling and prospecting were carried out until freeze up had occurred. The time was largely spent in the north portion of the gridded area.

Activities included:

- a). mapping a portion of the gridded area on a 1:2500 scale (1 cm to 25 cm), using the old installed grid lines.
- b). sampling, especially on newly located mineralization occurrences, was carried out.

Previously discovered zones of Au and Zn mineralization, including the Bousquet N. and S. showings; Alex Glatz 1989 and R. Fairservice occurrences were located and examined.

New occurrences of Au-Zn mineralization (L3E) similar to previous occurrences, were located through prospecting. Prospecting was made difficult by a thick moss covering found in the area.

GEOPHYSICAL - MAGNETOMETER & VLF-EM SURVEY

During the late fall of 1991, the line cutting grid work had been completed and a VLF-EM Survey using an EDA OMNI Plus field unit, geophysical survey was initiated. The survey was not completed when winter freeze up occurred on the lake. The survey is scheduled for completion in February, 1992.

The contrast in magnetic characters between the rock type is a useful tool for defining contacts in overburdened areas.

The VLF-EM performed to date is useful in interpreting structural patterns.

Both magnetic and VLF-EM surveys will be conducted on the expanded grid.

An I.P. Survey has been completed over a 42 km line area of the grid as well (January, 1992).

SOIL GEOCHEMISTRY

An orientation soil sampling was carried out on a portion of the gridded area from L1W to L12W along the south side of Beartrack Lake, near to the Bousquet South Showing.

Soil geochem sampling appears to have limited use in this area:

- a). Poor Development of soil profile,
- b). Tremendous variation of overburden ranging from moss cover to 10 - 20 meters of sand and boulders to very wet swamp areas.

A sharp anomaly was defined on the showing located on (BL-L8+50W). However, a pit has been blasted, therefore the anomaly is probably due to deterioration and weathering of blast rock.

It is unlikely the soil geochem survey will be expanded.

MECHANICAL STRIPPING

Stripping, using a wajax pump was carried out on a small area near L3E until freeze up had covered.

Manual and mechanical stripping and sampling are effective tools for prospecting the area.

Target areas as defined by geophysical and geological surveys will be stripped and sampled where ever possible. A GGD "Beep Mat" geophysical EM instrument

is useful in detecting sulfides under relatively shallow, 0 -1 meter, of overburden. Thus helping to focus stripping and trenching.

This method of prospecting is proposed to aid in target evaluation prior to diamond drilling stage.

DISCUSSIONS

MAPPING AND PROSPECTING

The geology described by the field map obtained of the Beartrack Lake area is similar to interpretation by OGS mapping efforts, including B.R. Berger et al, 1987, 1988, in Precambrian Geology; Laval & Hartman Townships (1987), Map 2534, Geology Preliminary Map - Precambrian Geology Laval Township (1988) Map P.3108. Also, a map by L.B. Charlton (1990); Precambrian Geology, Sandybeach Lake Area Preliminary Map P.3163.

Within the mapped areas, various rock units were observed. An intrusive rock, metadiorite, is the predominant map unit. It is a medium grained to coarse grained crystalline unit, slight variable composition and texture occurs from the NE margin to the SW margin of the gridded area. It is enclosed in lower and upper units of the Neepawa metavolcanic group.

Contacts are readily interpreted along the north and south margins of this intrusive unit. Along the south margin of the metadiorite, a meta-andesite pyroclastic to tuffaceous unit occurs. (Rocks belonging to the upper division of the Neepawa metavolcanic group. This andesite-pyroclastic unit has coarse-angular component - in it's clastic material and is indicative of a fairly high energy environment.

The north margin of the diorite unit is formed by fined grained mafic metavolcanics (lower division of the Neepawa Group) and includes finely banded to tuffaceous units, with minor pillowed volcanics and late mafic diking, rare andesite flows. Along the north contact a weakly gossaned >2 meter wide zone was observed and sampled (esp. L2W to L4W area).

Along the north margin of the meta diorite, in the volcanic extrusive rocks, a magnetite-ironstone occurs approximately on the boundary between upper and lower units of the Neepawa Group. This is a narrow unit, of laminated magnetite-chert and is weakly gossaned. It was followed for some distance and sampled in various locations.

Within and near to the magnetite diorite various mineralized occurrences were located, especially nearest to the NE and SW margins of the magnetite diorite. Within the metavolcanic rocks along the NE margin of the meta diorite, the G. Bousquet North showing was located. The geology and mineralization is similar to description given by Charlton (1990). A number of samples were taken at this locale.

Along the SW margin of the metadiorite, within the metadiorite, the G. Bousquet shout showing was located. It has been mapped and sampled a number of times previously. The alteration and mineralization are similar to the description by Charlton (1990). The showing was sampled a number of time to duplicate previous values. Old drill holes by Bousquet Gold Mines (1950) were located by casing pipes left in place.

In addition, a number of narrow fracture-shear systems, mineralized Au, Py, located by Alex Glatz (1989) were located and examined. They are E-W trending discontinuous along strike, 6 - 12 feet in width, sheared metadiorite, silicified, with a narrow 2 inch milky quartz-zone, red stained, pyrite, with previous

assays ranging to 6.00 oz Au ton. These previous pits were located in the area of L1W, along the North margin of the metadiorite.

Also, near Alex Glatz's pits near L1W, a mineralized felsic-rhyodacite dike-swarm set was located and sampled. This white-beige finely fractured, weakly gossaned unit ranging to 4 feet width returned assay values ranging up to .1 oz/ton Au.

In addition a variety of new mineral occurrences were prospected, including narrow shears, E-W trending, in the L1W area. A number of quartz-tourmaline E-W trending veins, especially near L9W, were located and sampled. Weak shears, E-W trending, in the L1E area were examined in the metadiorite.

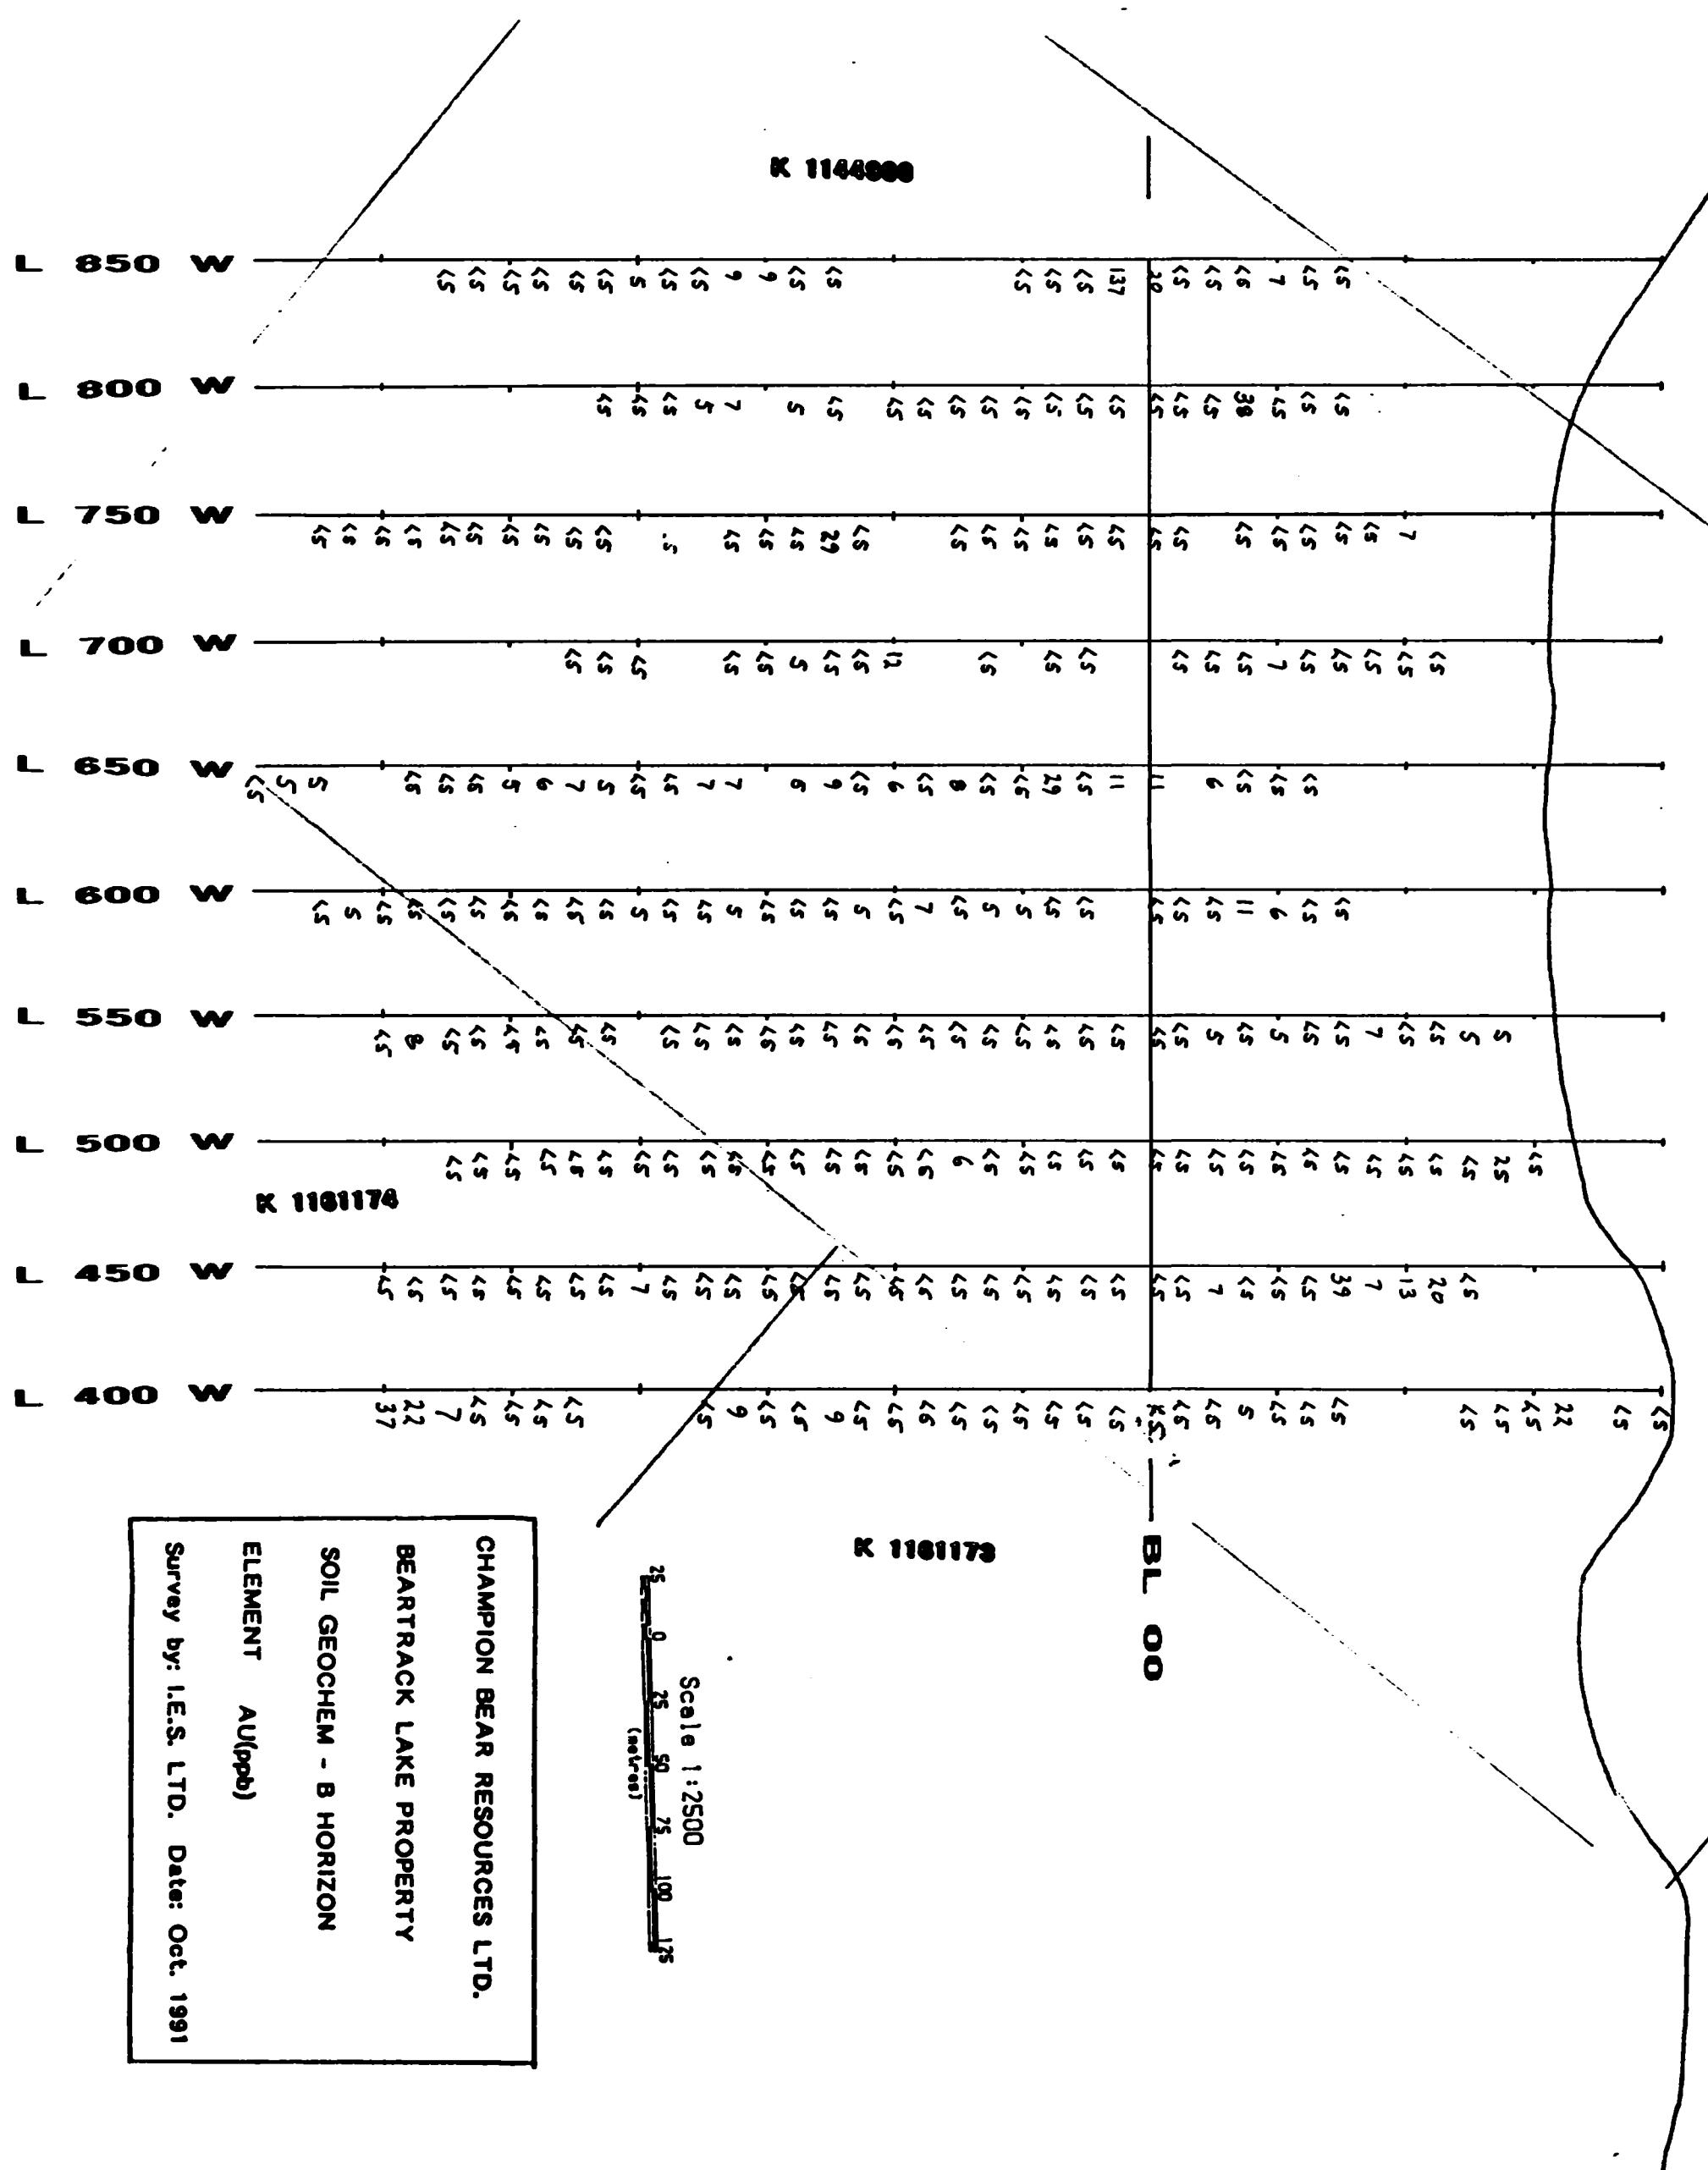

The most promising new mineral occurrence is a dilational fracture, mineralized Py, Au, N/IS trending in the L3E area, outlined by field prospecting along the north side of the lake. The mineralization is similar to the G. Bousquet South showing.

The southern portion of the zone is located along the top of the first ridge - metadiorite, north of the lake shore. Here it is a narrow zone; 8 feet of dilational fractured metadiorite, N/S trending, with an interior

4 - 6 feet zone of silicified, variably sericitized, Py-mineralized altered metadiorite, with a narrow 3 inch zone of very fine grained milky quartz, with py 10 - 15%. This zone, on the following to the north 50 meters, leads to diorite rubble, sheared, gossanized, along the edge of a ridge. Further to the north are old workings on this silicified diorite zone. The new zone returned assay values ranging to 200 ppb Au. The mineralization at the old workings to the north returned assay values ranging to over .1 oz Au. The implications from prospecting in the L3E area are that this area has not been examined fully. Stripping along this zone was in progress till freeze up.
