SUMMARY

A total of 126 samples from rhyolitic to quartz porphyritic intervals from drillhole TB83-1 were geochemically analysed for gold, silver, mafic oxides and minor elements.

These felsic units contain extremely low gold and silver values and should be considered of no economic interest.

INTRODUCTION

The 35 claims, which comprise the Westblock of Tarbush Lode Mining property, lies on strike to the west of Camreco's gold deposit where drilling has indicated 303,877 tons of probable ore with an uncut grade of .28 oz/ton Au.

In 1981, Tarbush Lode drilled 7 holes on the Westblock claims to test a granodiorite dike of some 6000 feet in strikelength. Results obtained in this drilling indicated the dike to be of limited width and no significant gold values were obtained (best assays are in the order of .002 oz/ton Au.

In 1983, Tarbush drilled 3 holes (TB83-1 to TB83-3) on the Westblock claim No. 437009 to verify "reported" results obtained in drilling by Bride Echo Mines in 1950. These Bride holes intersected a southwest striking unit of rhyolite bordered by a "band" of granodiorite containing goldvalues: details of these values are not known to the author.

Although not typically characteristic of the mineralized zones in the general area, hole TB83-1 was thought to be the best, still available hole for relogging and resampling for the purpose of geochemical investigations in order to establish certain geochemical parameters. These parameters are to serve as a basis for further rock geochemical exploration scheduled in the near future for the West and

norontex exploration ltd.

Introduction cont'd

.3

East blocks of the Company's property. (Presently samples are being prepared from granodioritic material obtained in the recent drilling on the Company's far eastern claims, the former Eaglelund property.)

Hole TB83-1, drilled at 50°, bearing easterly, total length 492 feet, intersected several zones of rocks which have been described by J. Dadds, geologist for Goldlund Mines, as rhyolite to variable rhyolite with occasional minor pyrite.

LOCATION

The 35 Westblock, Echo Township claims of Tarbush Lode Mining Limited are virtually all situated immediately west of kathlyn Creek, with a portion of the western boundary being the McAree-Laval township line.

The southeast corner of this block lies within 500 feet north of the paved highway 72, connecting Dinorwic and Sioux Lookout; the distance to Dinorwic is approximately 14 miles, whereas the distance to the Goldlund Mines turn off is 2.8 miles - see figure 1.

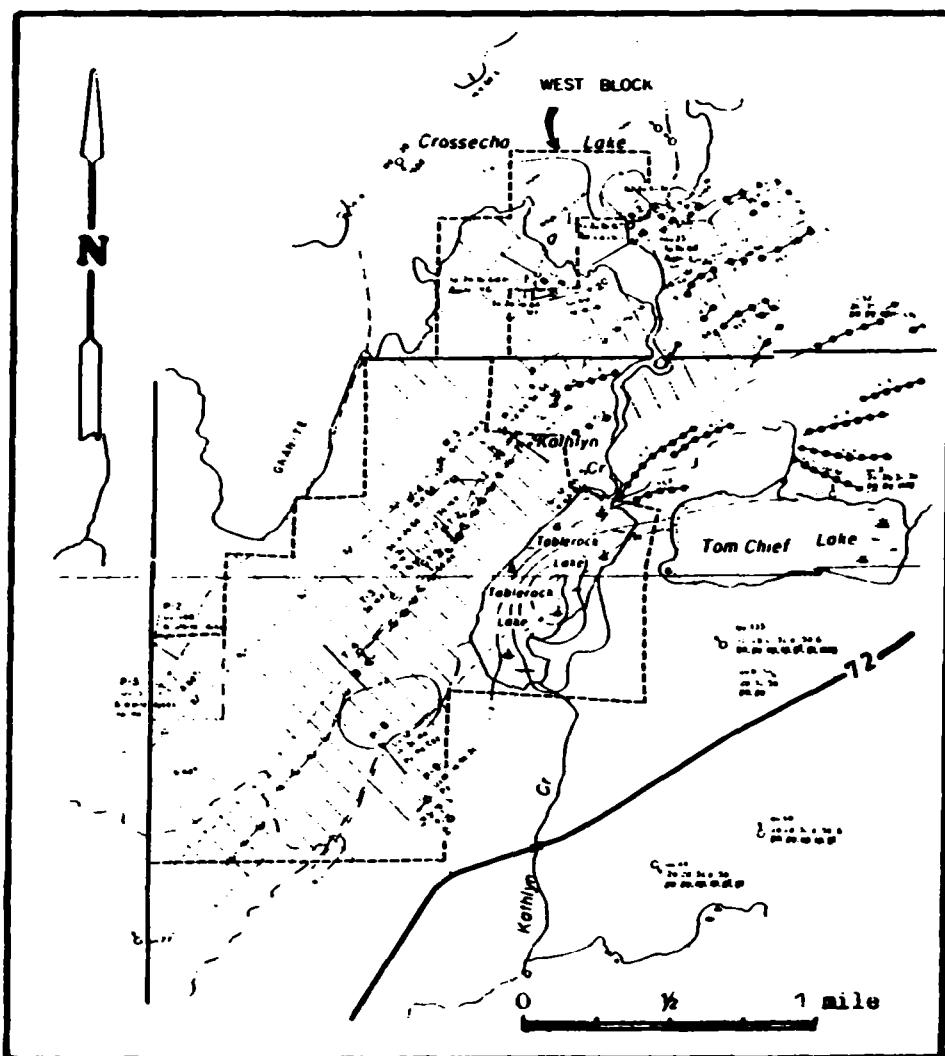

FIGURE 1

DISCUSSION

Sample populations in the order of 50 to 100 samples per lithological unit are required for statistical treatment. As such, three of the rhyolitic units, intersected by drillhole TB83-1 were sampled extensively; details are as follows.

From To	Description	No. of Samples	Sample Number	Sample Length
154-248	sheared variable rhyolite	92	3800-3892	1 foot
248-257	mafic volcanics	9	3893-3901	1 foot
257-266	granodiorite-quartzporphyry	9	3902-3910	1 foot
266-268	mafic volcanics	2	3911-3912	1 foot
324-342	weakly sheared granodiorite-quartzporphyry	14	3913-3926	1 and 2½ feet

In reviewing the results of the analyses - see addendum - it becomes clear that gold and silver values are negligible: in the first variable rhyolitic interval a mere 4 samples exceeded the detection limit for gold and ranged from 3ppb to 12ppb. This prohibits statistical treatment of the results.

However, on a less mathematical basis some conclusions can be drawn from the analyses

- 1) Background values for felsic volcanics are lower than 2ppb for gold and less than .5 for silver.

Discussion cont'd

.6

- 2) Background values for the mafic (to intermediate?) metavolcanics are in the order of 2 ppb.
- 3) By comparing Page's (1984, table 4, pg 152) Chemistry of felsic metavolcanics, the author is inclined to place the sampled intervals of drillhole TB83-1 in the category of rhyolites to rhyolitic lithic tuffs. As such, these intervals (with the extremely low goldvalues) should be considered of no further economical interest.

General:

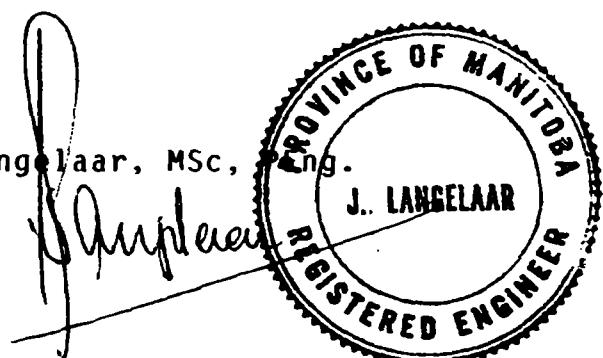

This lithogeochemical project is the first step in a scheduled larger scale geochemical exploration program on the West and East block claims of Tarbush Lode Mining.

Conclusions drawn to-date ought to be treated with caution as comparable material from elsewhere in the area is still lacking. Moreover sample acquisition from a characteristic suite of rocks from Goldlund Mines has been set back due to the closure of the mine earlier this year.

Several chemical analyses of a variety of rocktypes have been enclosed for use at a later date and for comparative purposes.

Dryden, December 5, 1985

Zn	87 ppm	74 ppm	83 ppm	85 ppm	108 ppm
Pb	17 ppm	18 ppm	13 ppm	22 ppm	18 ppm

Notes:

- * Original determination was for total Fe. For purposes of calculation and comparison, total Fe has been entirely converted to FeO.
- 4. Amphibolitized pillowd picrite basalt; sample taken from single pillow centre; shoreline exposure, northern shore of Nepawa Bay, lot 21, range IX, Nepawa Island.
- 5. Pillowed picrite basalt; whole rock sample taken from small road cut on western side of lot 20-21 road in the northern part of range I.
- 6. Pillowed picrite basalt; sample from single pillow from a large ridge exposure at the northern end of lot 19, range I.
- 7. Pillowed basalt; sample taken from centre of single pillow from clear shoreline exposure, lot 6, range IV.
- 8. Finely amphibolitized basalt with stretched pillows from road cut, lot 15, range VIII, Nepawa Island.

All analyses by the Laboratory Branch, Quebec Department of Natural Resources.

Sample Descriptions:

- 491 altered pillowd mafic flow (probably tholeiitic), Balmertown.
- 1436 altered pillowd mafic flow (probably tholeiitic), Balmertown.
- 1496 altered pillowd mafic flow (probably tholeiitic), Cochenour.
- 492 altered pillowd mafic flow (greater than 80 per cent coalesced variolites), Balmertown.
- 1643 unaltered variolitic pillowd mafic flow (almost entirely coalesced variolites), Hoyles Bay.
- 1283 altered felsic flow ("siliceous rock"), Campbell Mine.
- 1448 unaltered felsic flow, south of Balmertown.
- 1495 altered felsic flow? ("Point rock"), Cochenour.

MINING LANDS SECTION

Dear Miss Hurst,

Further to our telephone conversation of this morning, I enclose a copy of our invoice to Tarbush, dated December 5th, 1985 for the amount of \$1200, this being the charges for sample preparation, re-logging and report preparation.

This amount, being part of the total amount of \$12,072.10 - see second copy to OMEP - has been paid in full by Tarbush: proof of payment has been submitted by Mr. Broadhurst to the OMEP Evaluator.

Trusting that these copies may resolve the question of acceptance of the requested 362.2 days of which only 286.1 are required to bring these 18 claims to 200 days each, I remain,

Sincerely yours,
NORONTEX EXPLORATION LTD

Dear Sir:

Enclosed are two copies of a Notice of Intent with statements listing a reduced rate of assessment work credits to be allowed for a technical survey. Please forward one copy to the recorded holder of the claims and retain the other. In approximately fifteen days from the above date, a final letter of approval of these credits will be sent to you. On receipt of the approval letter, you may then change the work entries on the claim record sheets.

For further information, if required, please contact Mr. R.J. Pichette at (416) 965-4888.

**Notice of Intent
for Technical Reports**

February 25, 1986

2.8735/85-218

An examination of your survey report indicates that the requirements of The Ontario Mining Act have not been fully met to warrant maximum assessment work credits. This notice is merely a warning that you will not be allowed the number of assessment work days credits that you expected and also that in approximately 15 days from the above date, the mining recorder will be authorized to change the entries on the record sheets to agree with the enclosed statement. Please note that until such time as the recorder actually changes the entry on the record sheet, the status of the claim remains unchanged.

If you are of the opinion that these changes by the mining recorder will jeopardize your claims, you may during the next fifteen days apply to the Mining and Lands Commissioner for an extension of time. Abstracts should be sent with your application.

If the reduced rate of credits does not jeopardize the status of the claims then you need not seek relief from the Mining and Lands Commissioner and this Notice of Intent may be disregarded.

If your survey was submitted and assessed under the "Special Provision-Performance and Coverage" method and you are of the opinion that a re-appraisal under the "Man-days" method would result in the approval of a greater number of days credit per claim, you may, within the said fifteen day period, submit assessment work breakdowns listing the employees names, addresses and the dates and hours they worked. The new work breakdowns should be submitted directly to the Land Management Branch, Toronto. The report will be re-assessed and a new statement of credits based on actual days worked will be issued.

If the reduced rate of credits does not jeopardize the status of the claims then you need not seek relief from the Mining and Lands Commissioner and this Notice of Intent may be disregarded.

If your survey was submitted and assessed under the "Special Provision-Performance and Coverage" method and you are of the opinion that a re-appraisal under the "Man-days" method would result in the approval of a greater number of days credit per claim, you may, within the said fifteen day period, submit assessment work breakdowns listing the employees names, addresses and the dates and hours they worked. The new work breakdowns should be submitted directly to the Land Management Branch, Toronto. The report will be re-assessed and a new statement of credits based on actual days worked will be issued.
