

KEEVIL MINING GROUP LTD.

PIKE LAKE CLAIM GROUP

REPORT ON THE

GEOFHYSICAL SURVIYS

REPORT NO. 20P

N.T.S. **5**2 J/13

SEFTEMBER 22, 1965

R. W. WOOLHAM

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

The Pike lake claim group was staked to protect a small high grade copper showing located or claim PA33727. An area around the showing covering approximately six claims was explored by geophysical surveys.

Magnetic anomalies most probably caused by gabbro and associated magnetic rocks were outlined. No electromagnetic anomalies were located.

No further work on the claims is recommended.

ACCOMPANYING MAPS

(1) Dwg. 3016 - "Magnetic Gurvey"

(2) Dwg. 3015 - "Vertical Loop E. M. Survey"

INTRODUCTION

Keevil Mining Group Ltd. claims (Pike Lake Group) consists of 13 contiguous claims numbered PA33726 to PA33731 inclusive and PA34891 to PA34902 inclusive located in the Patricia Mining Division, district of Kenora. Claims PA33726 to PA33731 were recorded September 28, 1964 and claims PA34891 to PA34902 were recorded April 5, 1965. The claims were staked to protect a small high grade copper showing examined for us in 1960.

Exploration work consisting of a magnetometer and vertical loop electromagnetic survey was carried out using previous picket lines cut in 1960. The lines were reblazed and rechained for the surveys. The surveys were done by Geophysical Engineering and Surveys Ltd. personnel, the operator being J. Martin, 73 Algonquin Blvd. E., Timmins, Ontario. The surveys were carried out during the period September 1, to September 15, 1965. Only the claims PA33726, PA33727, PA33728, PA33730, PA34901, and PA34902 are being submitted for assessment work credit.

All work was some under the direct supervision of the writer.

LOCATION AND ACCESS

The claims are situated in the Kenora district northwestern Contario approximately two miles southwest of the southwest end of Sturgeon Lake.

Access to Sturgeon Lake is by the Ignace-Savant Lake road or by floatsequipped aircraft to Sturgeon Lake. The claims cross an abandoned rallway spur which affords access from Sturgeon Lake to the property.

DESCRIPTION OF SURVEYS

Magnetometer Survey

The magnetometer survey was done with a Sharpe Fluxgate Model M. F. 1 magnetometer having a constant of 20 gammas per scale division. Readings were taken at 100-foot intervals along all the picket lines. Diurnal readings at 1 to 1½ hour intervals were taken on permanent base stations located on the base line at 4+00W, 12+00W, 2C+00W, and 26+00W. The results were corrected, plotted, and contoured as shown on the accompanying map.

Approximately 390 readings were taken.

Electromagnetic Survey

The electromagnetic survey was done with a Sharpe SE200 V. E. M. unit fitted with a special amplifier and batteries in order to increase the range to 500 feet. A reconnaissance survey of the lines was done using the parallel line method. In this method readings are taken at 100-foot intervals on every line with the transmitter located at the same station on an adjacent line. The transmitter-receiver interval thus is the line spacing or, in this case, 400 feet.

Any indicated crossovers were then checked by the fixed transmitter method. In this method, the transmitter is set up on the indicated crossover and readings taken at 50-foot intervals on the adjacent lines or line. In this way, the conductor is traced from line to line and accurately located within 25 feet on every line.

Approximately 380 stations were read.

RESULTS OF SURVEYS

Magnetometer Survey

Several magnetic anomalies were outlined in the survey area. Particularly high magnetic relief was encountered on line 30+00W, south of the base line (2000 to 7000 gammas above background). Outcrops of gabbro in the survey area suggest that most of the magnetic anomalies are caused by this rock. No significant magnetic anomaly is associated with the showing area.

Electromagnetic Survey

The electromagnetic survey did not detect any conductors on the property. Detail set-ups were made in the showing area, however, no significant conductive zone was outlined.

GEOLOGY

The claims area contains few outcrops, but, in general, appears to be underlain by basic volvanics, granite, diorite and gaboro.

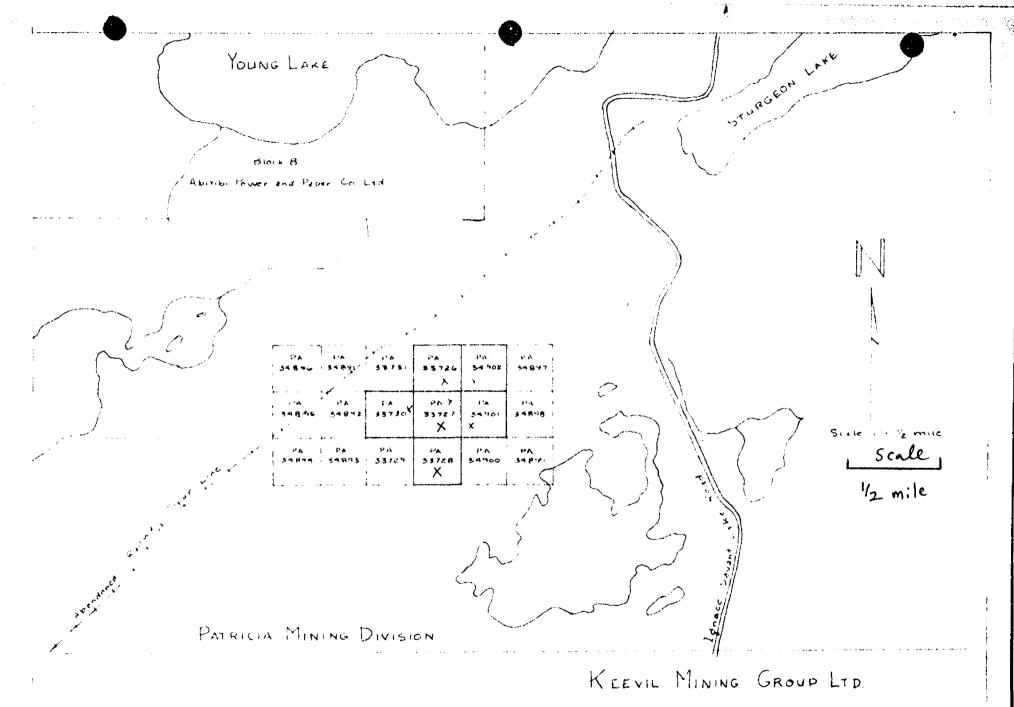

The showing consists of a narrow shear zone in diorite heavily mineralized with massive weins, stringers, and patches of chalcopyrite. Some quartz is associated with the mineralization.

Width of the shear zone is a maximum of 36 inchesaand it has been traced for several hundred feet.

ASSESSMENT CREDITS

Assessment credits in the amount of 12.9 days for the magneto-meter survey and 16.3 days for the electromagnetic survey were submitted on claims PA33726 to PA33730 inclusive, PA34901 and PA34902.

No other work is available.
