LAC DES ILES PROPERTY

Thunder Bay Mining Division
Ontario
OMEP Programme
January 1 - December 31, 1987

1. INTRODUCTION

The Madeleine Mines Ltd. property is located approximately 50 miles north of Thunder Bay, Ontario; and consists of 85 leased claims located at the south end of Lac des Iles.

The claims cover the basic and ultra basic rocks of the Lac des Iles complex. This complex and the surrounding granites and tonalites are of Archean Age.

In 1963, prospectors discovered copper-nickel sulphide mineralization south of Lac des Iles.

Gunnex Limited acquired a large block of claims in the area; and located eight sulphide zones some of which contained palladium and platinum. Anaconda Canada Exploration Ltd. optioned the claims from Gunnex in 1966; and conducted further diamond drilling.

When Anaconda dropped the properties in 1973, Boston Bay Mines Ltd., acquired the claims by option and staking.

Drilling by Boston Bay Mines encountered platinum group metals associated with minor copper-nickel concentrations. The location of a new zone, called the Roby Zone sparked renewed interest in the property.

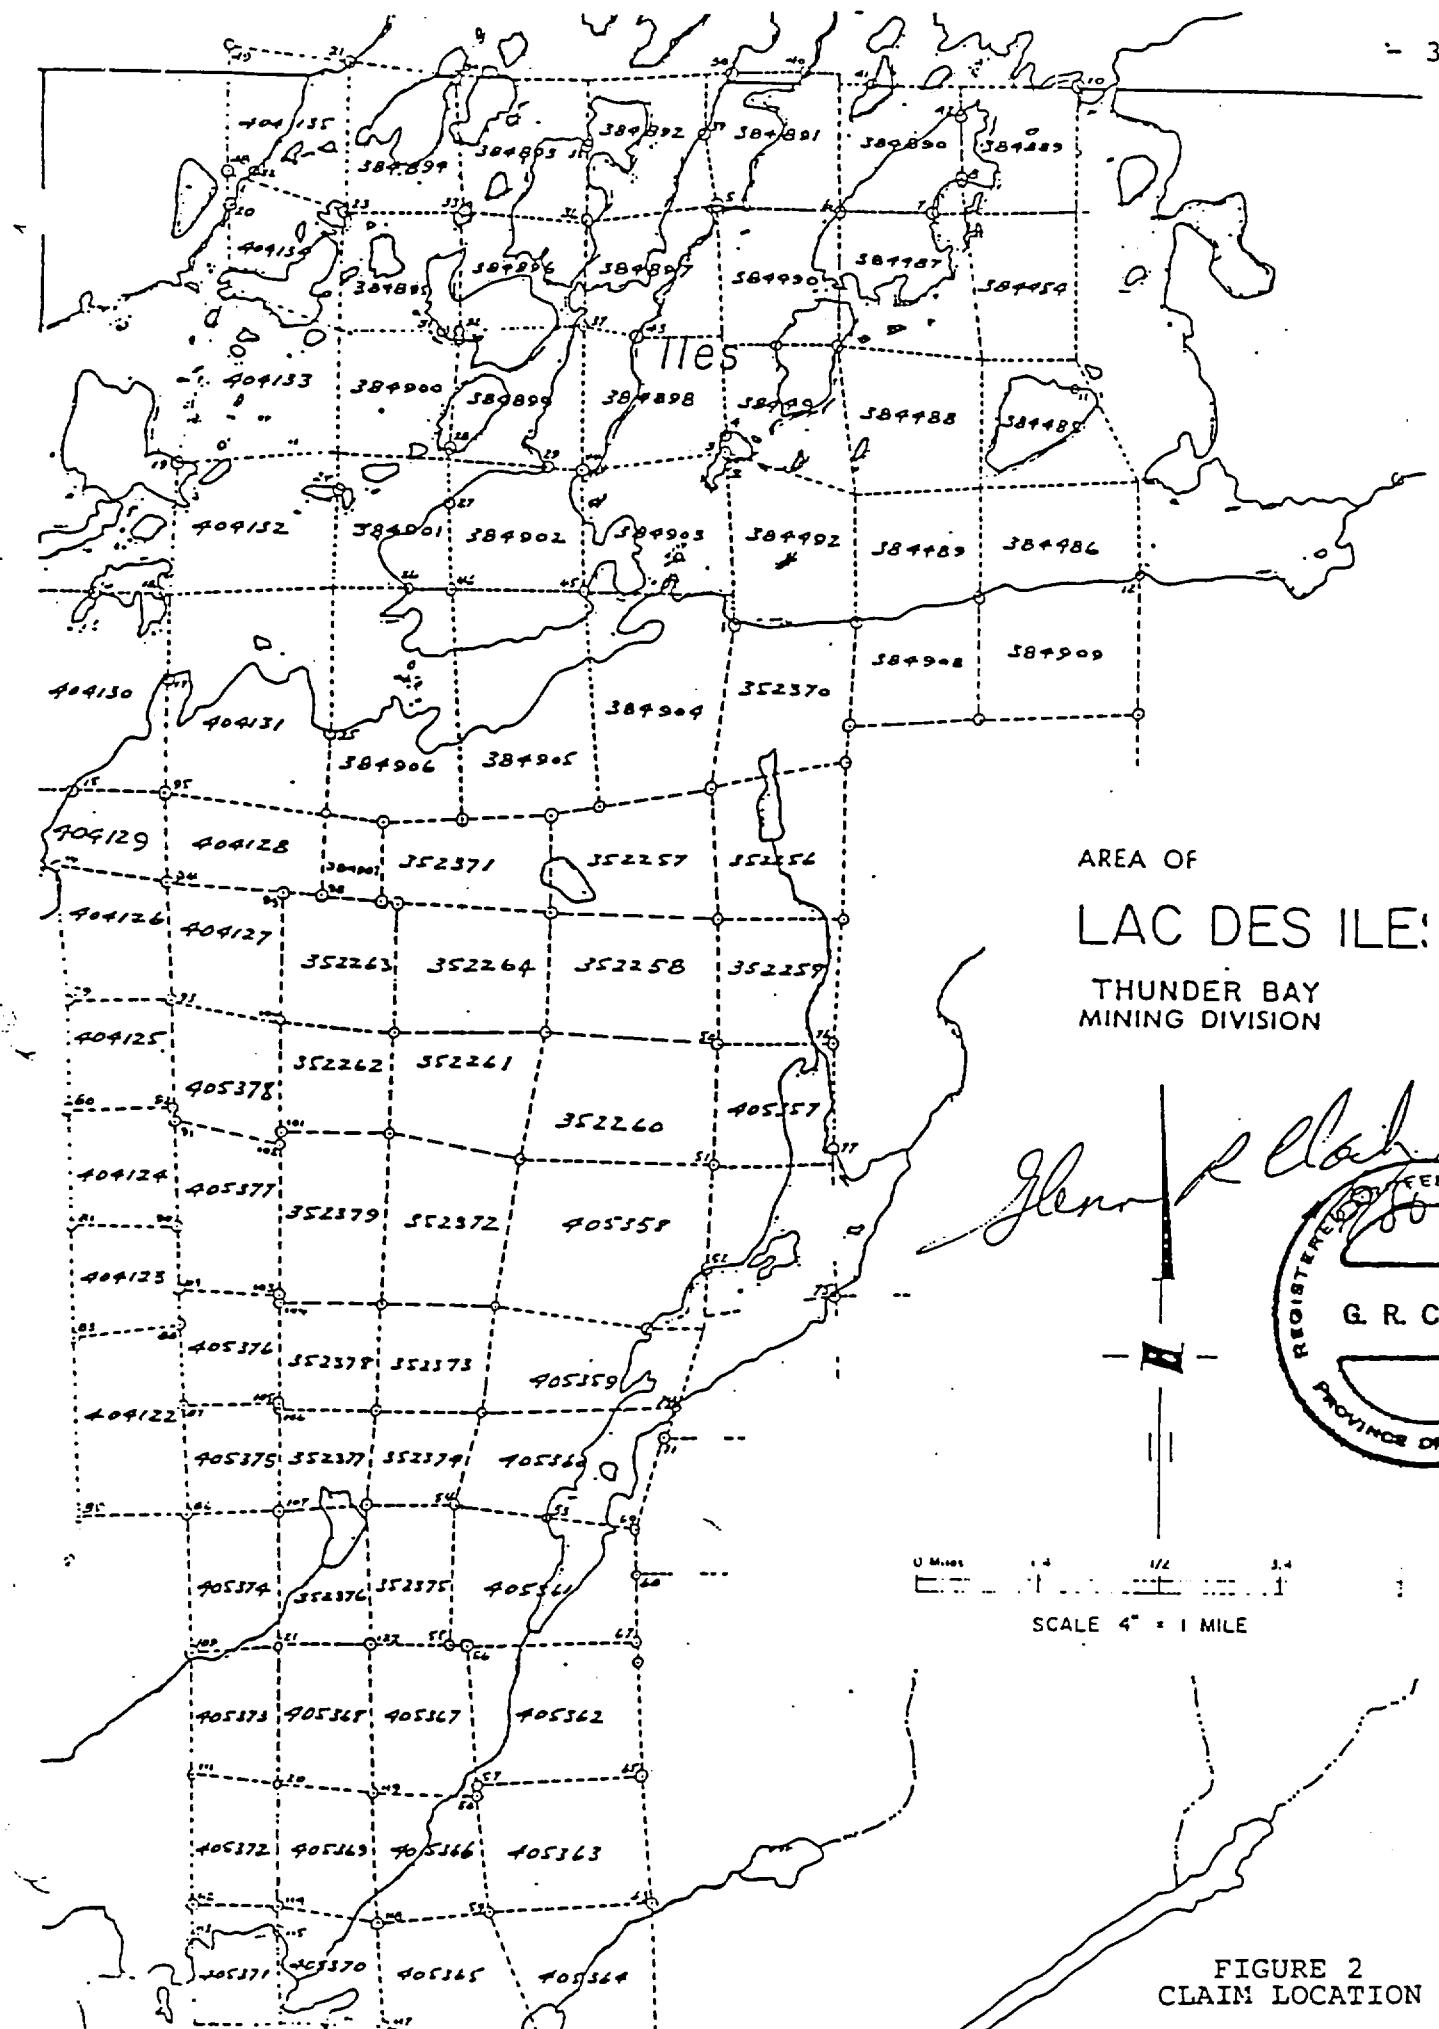

Texasgulf optioned the property in the spring of 1975 and continued the diamond drilling programme.

This drilling proved up considerable reserves on two important zones, the Roby Zone and the C Zone.

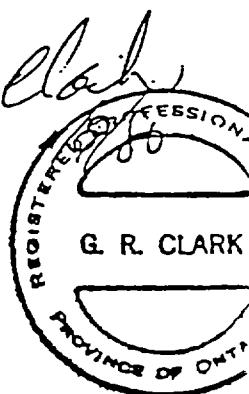

The Texasgulf and Boston Bay drilling outlined approximately 6,490,000 tons available by open pit mining to 500 feet. The deepest drill hole indicates the platinum-palladium mineralization extending to a depth of 1,465 feet; and it is open at that depth.

The drilling of the C Zone has indicated 900,000 tons mineable by open pit methods.

Texasgulf and Boston Bay drilling amounted to 64,356 feet in 117 holes.

FIGURE 2
CLAIM LOCATION

In April of 1986, Madeleine entered into an agreement with The Platinum Group Mines Limited. Under the agreement, Madeleine Mines and The Platinum Group will work towards a final amalgamation which will see Madeleine acquire a 100% interest in the property.

Under the terms of the agreement with The Platinum Group, if a suitable amalgamation acceptable to all cannot be arranged, Madeleine will have the option to bring the property to production at 3,000 tons per day and earn a 50% interest in the property for so doing.

In early June, 1986, Madeleine Mines commenced an exploration programme on the Lac des Iles property. The programme consisted of diamond drilling, line-cutting (to establish grids), clearing timber and stripping overburden from the Roby Zone.

The purpose of the drilling programme was to detail the Roby Zone for open pit mining; explore the depth extensions of the Roby Zone; and investigate the extent of the lower grade halo to the west of the Roby Zone.

In 1986, a total of 36,777 feet were diamond drilled in 34 holes.

In 1987, Madeleine Mines continued the diamond drilling programme and a total of 11,319 feet was drilled in 16 holes.

In addition, 935,000 cubic yards of trenching were completed to assist in outlining the extent of the orebody for open pit production.

Further a 12 mile access road was completed from Mile 60 on Highway 527.

2. THE PROPERTY, LOCATION AND ACCESS

The property consists of 85 leased claims in the Thunder Bay Mining Division. It is located approximately 50 miles north of Thunder Bay, Ontario. The claim numbers are indicated in the accompanying Figure 2.

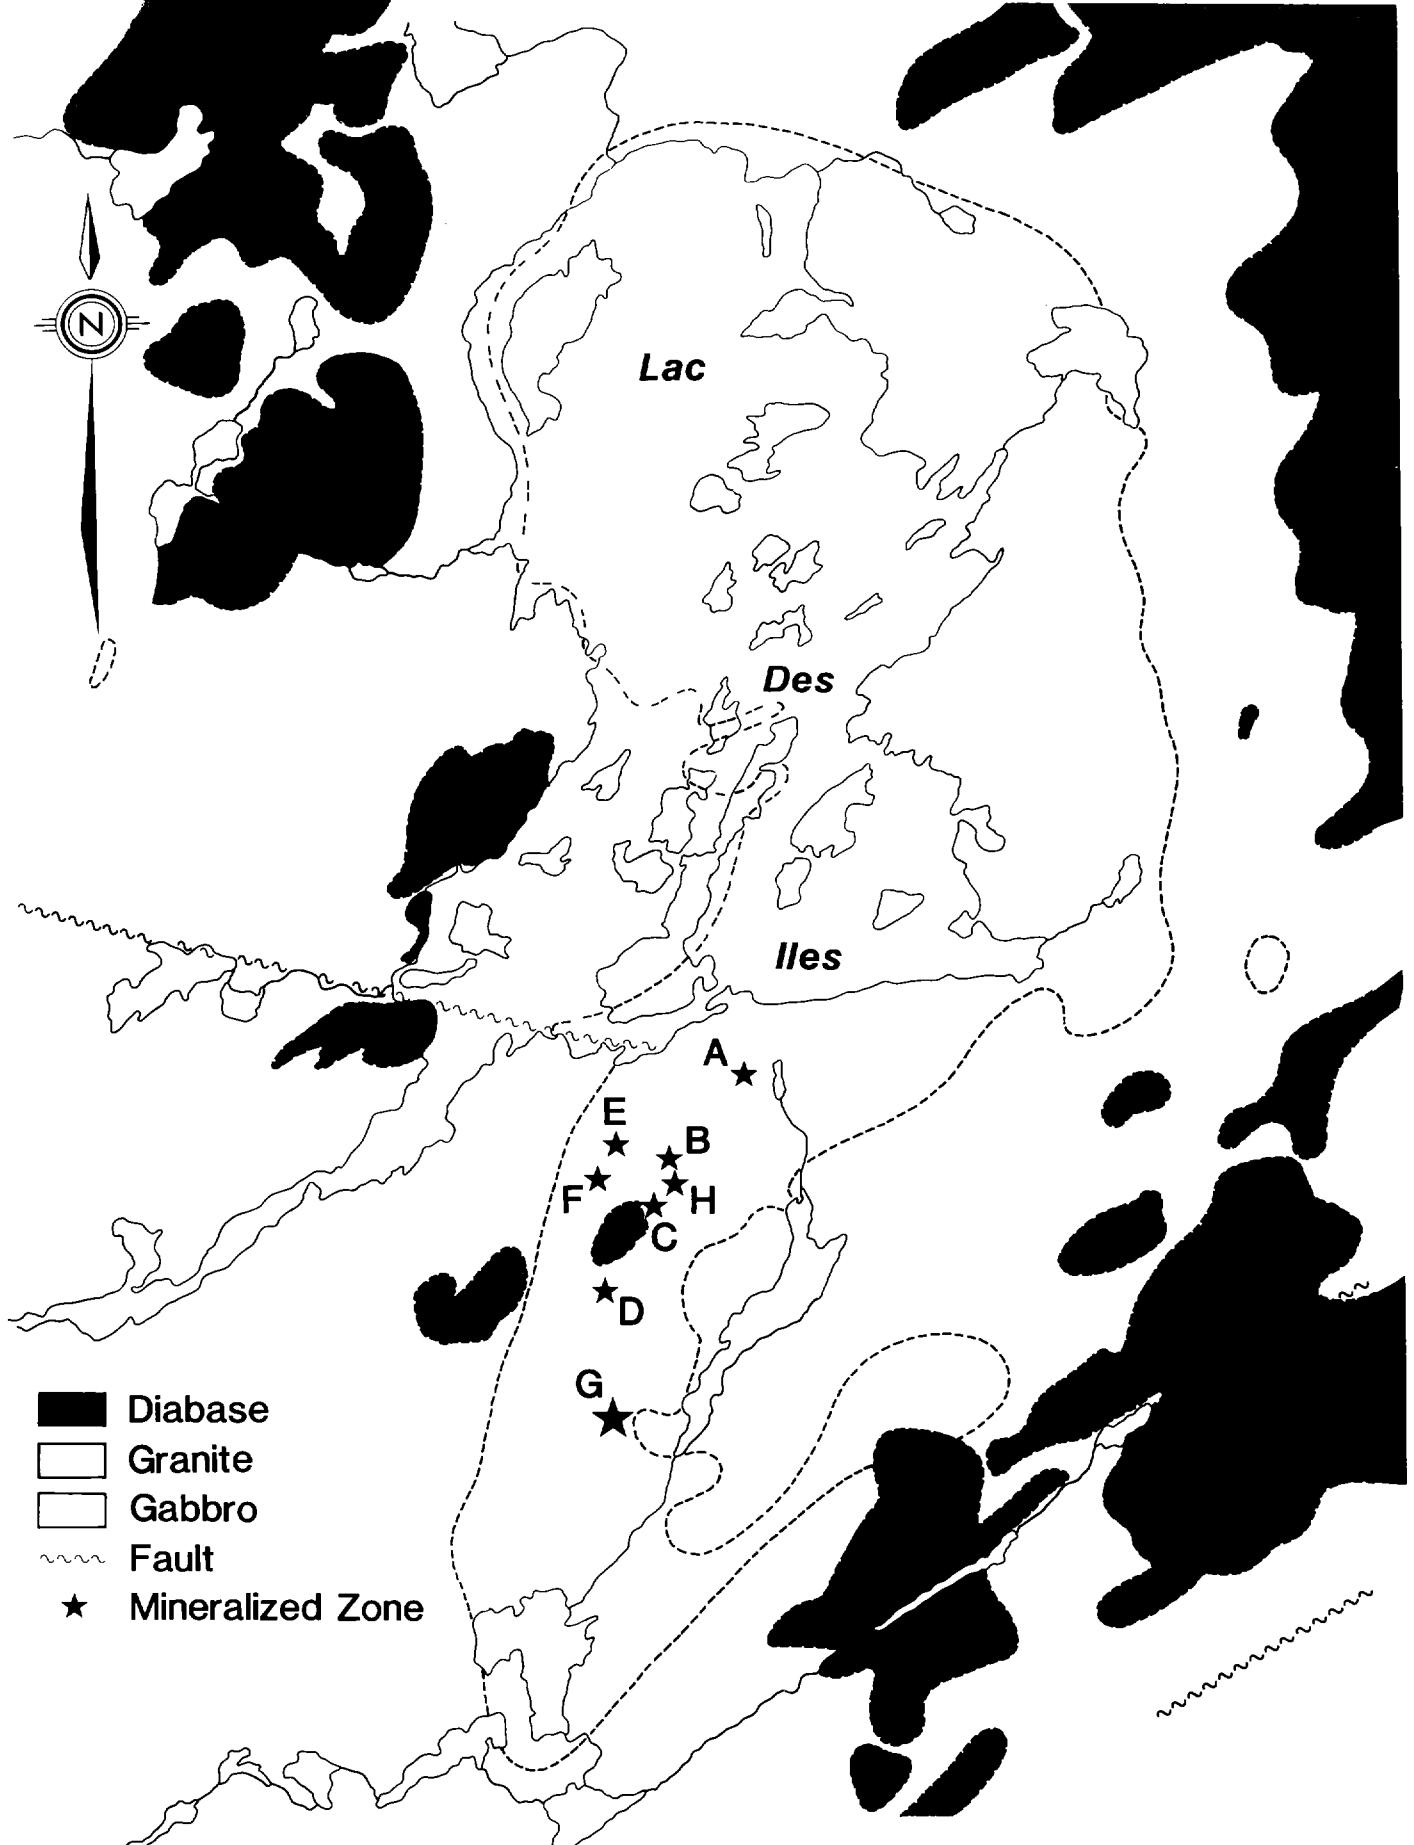

The claim numbers are as follows:

TB 352256-352264 inclusive	TB 384889-384909 inclusive
TB 352370-352379 inclusive	TB 404122-404135 inclusive
TB 384484-384492 inclusive	TB 405357-405378 inclusive

The property is located at the south end of Lac des Iles; and covers the basic and ultrabasic rocks of the Lac des Iles complex.

The property is approximately 12 miles due west of Mile 60 on Highway 527 (Figure 1). The access road covering the 12 miles has been completed.

The property may also be reached by float or ski-equipped aircraft from Thunder Bay.

STRUCTURAL GEOLOGY

FIGURE 3

3. HISTORY

A general chronology of the exploration of the property is covered in the Introduction to this report.

The Gunnex Limited exploration in 1963, 1964, included geological mapping, geochemistry, ground geophysical surveys and diamond drilling. Eight sulphide zones (A, B, C, D, E, F, G, H), some bearing platinum-palladium mineralization, were located (Figure 3).

During the summer seasons of 1964 and 1965, the Ontario Department of Mines conducted a geological survey of the area under the direction of Dr. E.G. Pye.

Drs. Macdonald and Sutcliffe of the Ontario Geological Survey have carried out detailed mapping of the property and its environs during the summer of 1986.

The Boston Bay Mines exploration consisted of detailed geophysical surveys (magnetic and electromagnetic) and diamond drilling. The Texasgulf programme was essentially diamond drilling.

The complete drill holes were divided into 10 foot lengths for assay purposes. The core was split and one half was sent for assay; the remainder kept as a record.

Assaying was for platinum group metals using the fire assay method. Bell-White Laboratories, Haileybury, did this work. Later, Bell-White were requested to assay all samples for copper and nickel. In the current programme Bell-White is also assaying for gold.

Representatives of Rustenberg Mines of South Africa visited the property in 1975. They checked a number of the Bell White assays; and their results show good correlation with Bell-White (Figure 5).

The Rustenberg assays are slightly higher than Bell-White due to the fact that their results include gold values with the platinum group metals, while Bell-White assays only cover the platinum group metals.

They show roughly a palladium-platinum ratio of 8:1.

4. GEOLOGY AND MINERALOGY

The area around Lac des Iles is underlain by rocks of Precambrian Age. Basic and ultrabasic rocks of the Lac des Iles complex are completely surrounded by younger granites and tonalites.

There are erosional remnants of the Keweenawan diabase sills. There is a small remnant of a sill just south of the Roby Zone.

The Lac des Iles complex includes anorthosite, anorthositic gabbros, norite, pyroxenite, peridotite, serpentinite, quartz gabbro and their altered equivalents.

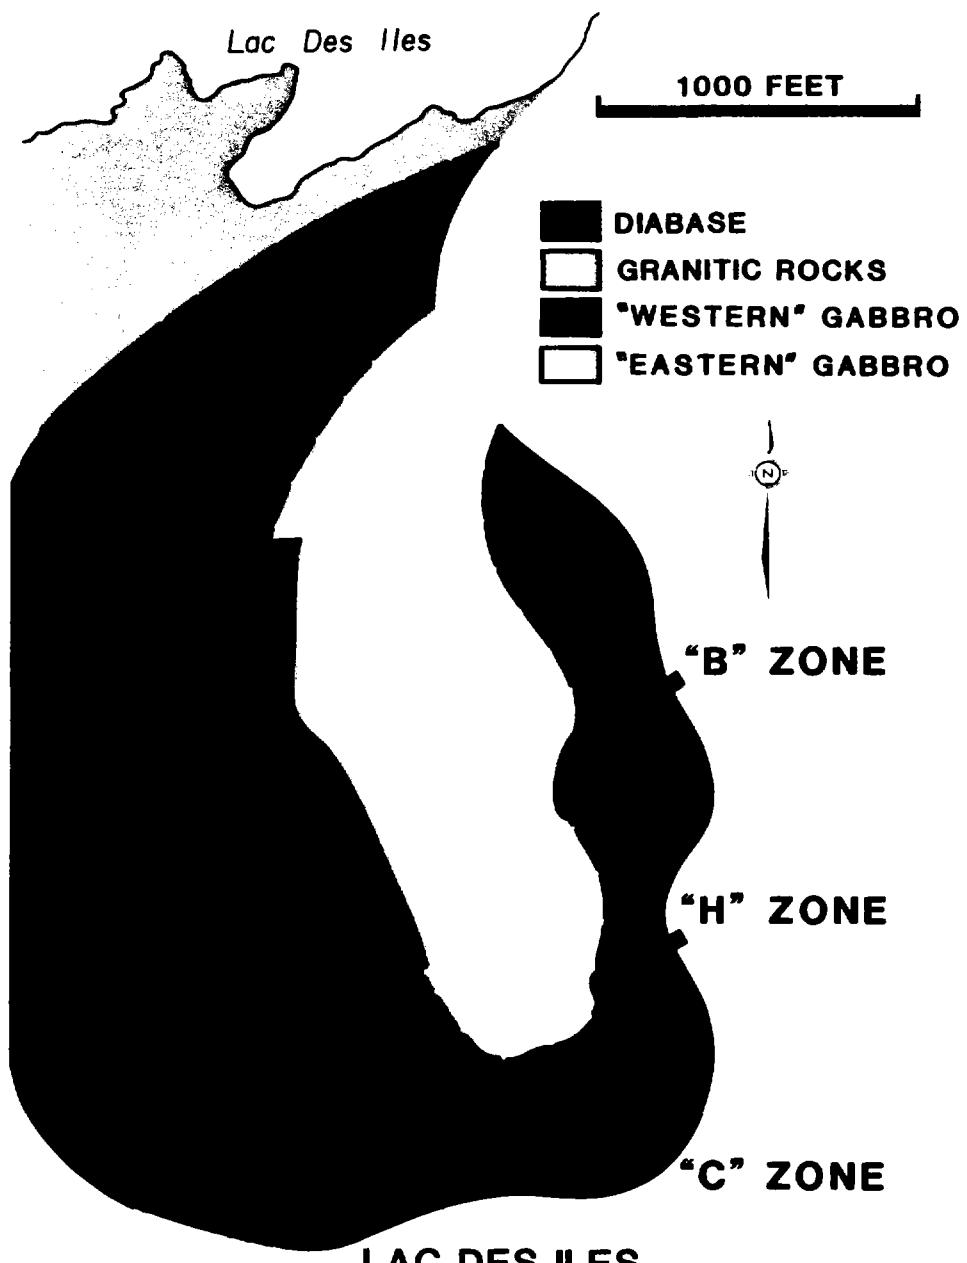

FIGURE 4

The southern section is divided into two mafic units. The Eastern Gabbro is a medium grained gabbro to norite; and is oxide-rich, sulphide poor. The Western Gabbro is coarsergrained and sometimes pegmatitic consisting of gabbro (70%), norite (20%), clinopyroxenite, and minor anorthosite (Figure 4).

The latter are layered, steeply dipping and contain copper, nickel, iron sulphides and platinum group sulphides, arsenides, antimonides and tellurides.

The principal platinum group minerals are:

Vysotskite - (Pd,Ni) S
 Braggite - (Pt,Pd,Ni) S
 Kotulskite - Pd (Te,Bi)
 Isomertieite - Pd,Sb₂,As₂
 Merenskyite - Pd,Te₂
 Sperrylite - Pt,As₂
 Stibiopalladinite - Pd₅ (Sb,As,Te)₂
 Stillwaterite - Pd₈,As₃

5. ORE RESERVES AND METALLURGY

The palladium-platinum minerals have been found in a number of zones in the area of Lac des Iles. The most important zones found to date are the Roby Zones and the C Zone.

The Roby Zone has received the most investigation and is the zone of immediate economic importance.

The Roby Zone strikes approximately N20 degrees W, dips vertically to steeply east and extends for some 2,000 feet. It has a maximum width of 375 feet.

It is amenable to open pit mining. The pit area requires the clearing of 34 acres.

The deepest drill hole to date, Hole D1, shows the mineralization extending downwards to 1,465 feet; and open at depth. In this hole a section from 1,095 feet to 1,245 feet averaged 0.235 platinum group metals per ton; and from 1,245-1,465 feet, 0.0725 ounces PGM per ton.

The Roby mineralization appears to be syngenetic and a product of magmatic segregation and magma mixing.

An open pit on this zone would have a length of 1,700 feet and an average width of 83 feet.

Glenn R. Clark, P.Eng. estimates: an open pit reserve of the Roby Zone to 500 feet of 6,490,000 tons with an average grade of 0.18 ounces of platinum group metals per ton, 0.01 ounces gold per ton, 0.1% copper and 0.1% nickel. Subsequent assaying indicates an average grade of 0.02 ounces gold per ton. Clark's reserves were based on 52 drill holes totalling 32,000 feet of drilling.

For the C Zone, Clark estimates 900,000 tons with an average grade of 0.14 ounces of platinum group metals per ton. This is open pit material.

Total reserves to 1,500 feet are estimated at 20,400,000 tons with an average grade of 0.18 ounces of platinum group metals.

It will be noted that the Roby Zone, C Zone, H Zone and B Zone are closely related to the West Gabbro - East Gabbro contact.

The palladium-platinum mineralization does not appear to be directly related to the total sulphides present.

Heavier concentrations of platinum group metals occur in the clinopyroxenite in proximity to the West Gabbro - East Gabbro contact; and in the mineralized norites of the West Gabbro.

The platinum-palladium ores are amenable to concentration by flotation. The recovery circuit uses gravity ahead of flotation. Early indications show a high grade jig concentrate.

It is intended to treat the concentrates in the hydrometallurgical facility. The concentrates are pressure leached and produce a PGM rich residue which is sent to the refinery. A combined recovery of the significant metals of approximately 85% is expected from the combined gravity and flotation circuit.

Flotation tests have been conducted by 4 laboratories including Falconbridge, Placer and Noranda.

It is expected that minor but recoverable amounts of Rhodium, Ruthenium, Osmium and Iridium will be produced.

6. THE EXPLORATION PROGRAMME

The exploration programme consisted of diamond drilling and rock trenching.

The purpose of the diamond drilling was to detail the ore reserves, explore the extensions of the Roby Zone to depth, and to search for higher grade zones in the large mineralized halo to the west of the Roby Zone.

Trenching was carried out over the Roby Zone to expose the ore and determine its limits for open pit production. This also provided bulk samples for metallurgical testing.

A. The Diamond Drilling Programme

During the period January to December, 1987, Madeleine Mines diamond drilled 11,319 feet in 16 holes on the Lac des Iles property.

These holes indicate that the Roby Zone extends to depth and plunges to the south. However, hole 86-14 on Section 519 suggests that the plunge may be quite

ep. Hole 86-14 intersected 0.127 ounces per ton PGM over 190 feet (within which was a 60 foot intersection of 0.191 ounces PGM per ton) between the -750 foot and -900 foot elevations.

The drilling also further outlined the better grade mineralization of the Central Zone and the West Zone in the mineralized halo to the west of the Roby Zone.

A summary of the 1987 diamond drilling is as follows:

<u>Hole Number</u>	<u>Section</u>	<u>Length</u>	<u>Footage</u>	<u>Width (Feet)</u>	<u>PGM Oz/Ton</u>
87-35	508	236'	50 - 70 120 - 140 170 - 237	20' 20' 37'	.106 .087 .047

87-51	510	860'	-	-	-
Total		-----	11,319'	16 Holes	

The sampling has been done in 10 foot sections. The core has been halved either by splitting or diamond saw. One half of the split core is sent for assay. The corresponding half is retained for the record.

Initially, the most promising sections in the hole are sent for assay; but, because of the difficulty of visually assessing the mineralization, all of the core is being split and sent for assay.

The sample numbers on the assay sheets indicate the number of the hole and footage. The initial digits indicate the hole number; the final digits, the footage in multiples of 10.

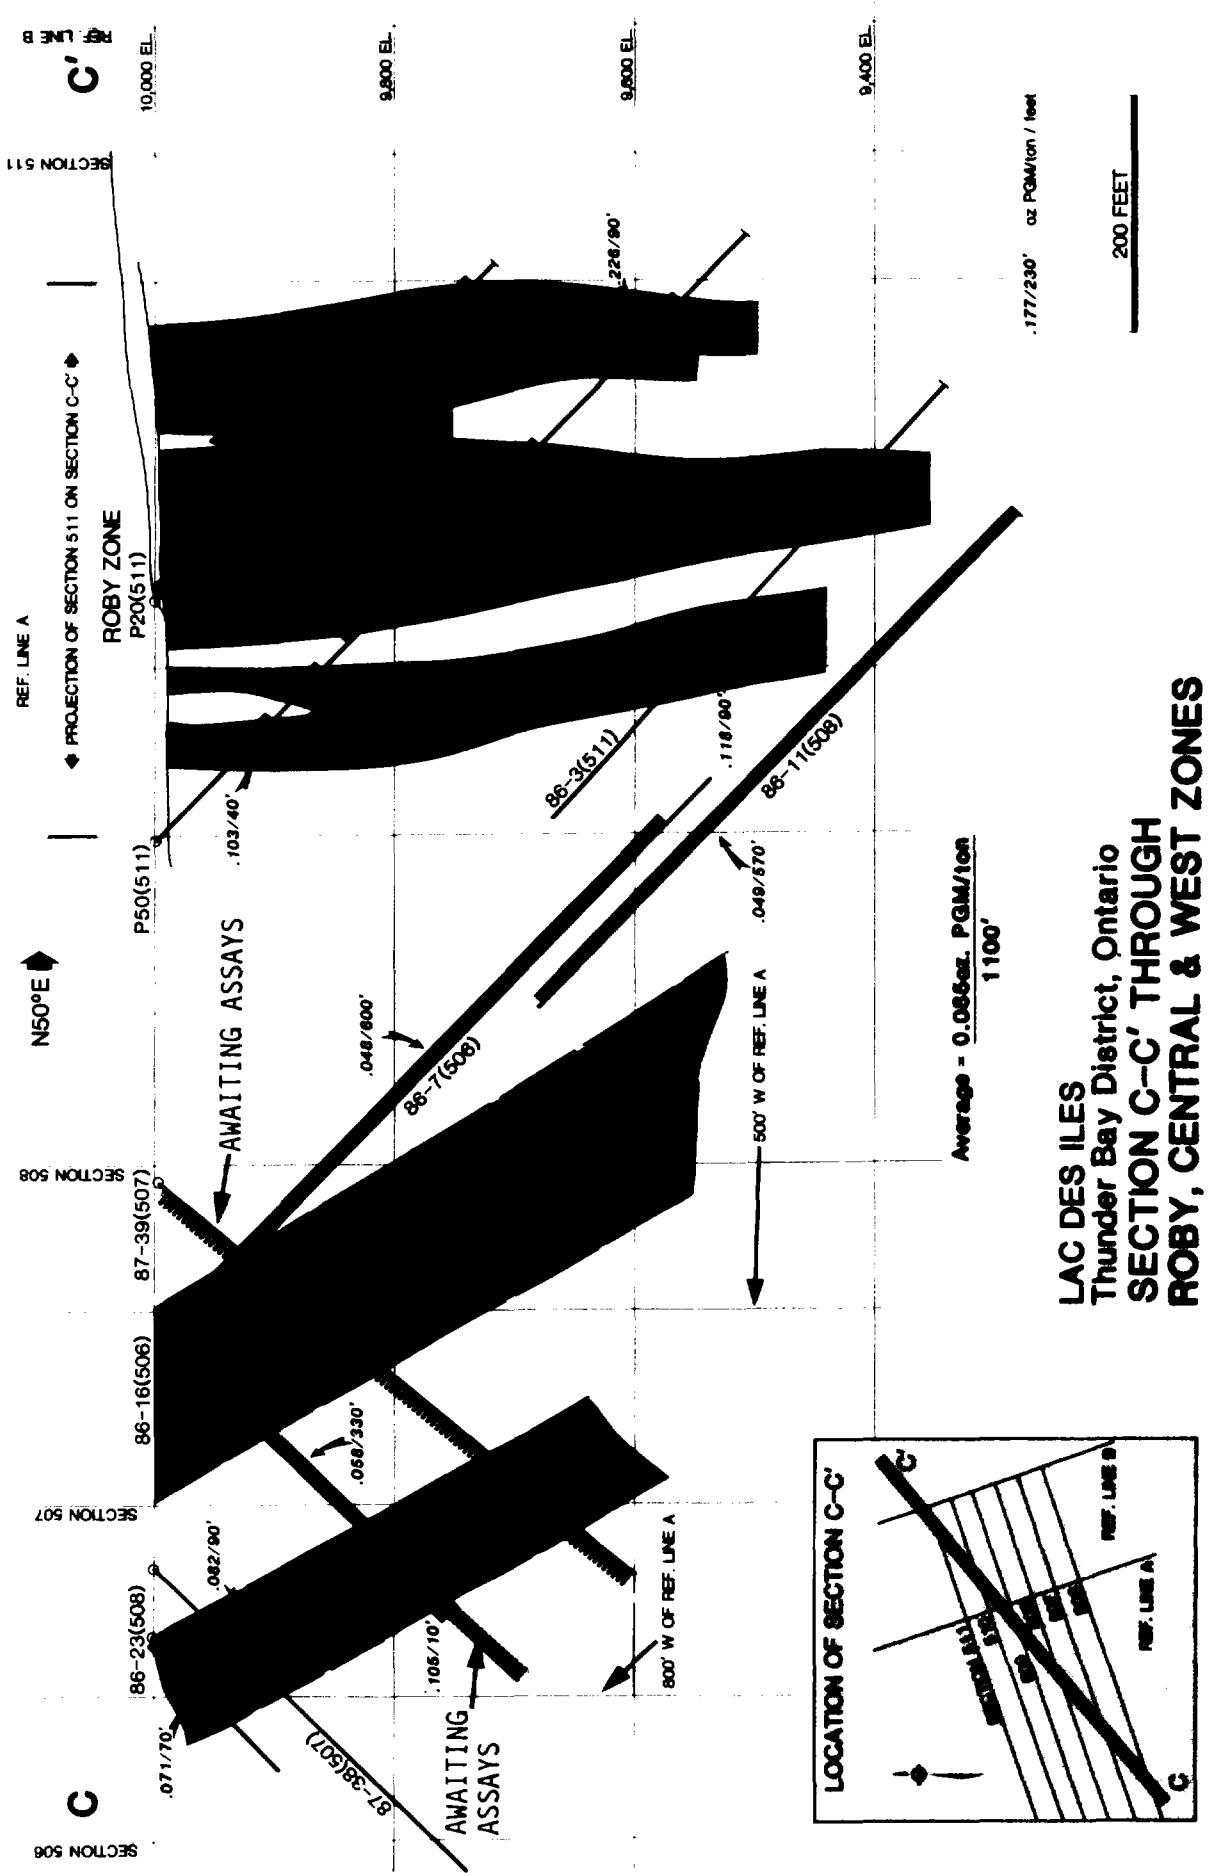

FIGURE 6

For example, sample number 21004, is from Hole 21 and represents the section for 30 to 40 feet. Sample number 21075 is from Hole 21 and represents the section from 740 to 750 feet.

In diamond drilling the low grade halo to the west of the Roby Zone, a number of holes have indicated two bands of higher grade, the Central Zone and the West Zone as indicated in the following assays:

Central Zone

Section 506

Hole 86-7 - 0.112 ozs. PGM/54' - 0.10 ozs. PGM/84'
Hole 86-16 - 0.102 ozs. PGM/90' - 0.137 ozs. PGM/60'
Hole 86-22 - 0.101 ozs. PGM/90'

Section 507

Hole 86-19 - 0.060 ozs. PGM/70'

Section 508

Hole 86-11 - 0.093 ozs. PGM/20'

West Zone

Section 506

Hole 86-16 - 0.68 ozs. PGM/110'

Section 507

Hole 87-38 - 0.082 ozs. PGM/90'
Hole 87-39 - 0.085 ozs. PGM/40'

Section 508

Hole 86-35 - 0.85 ozs. PGM/20'
Hole 86-23 - 0.063 ozs. PGM/60'

Section 509

Hole 87-34 - 0.084 ozs. PGM/10'

Section 510

Hole 86-26 - 0.088 ozs. PGM/40'

Section 511

Hole 86-18 - 0.070 ozs. PGM/60'

A section drawn through the Roby, Central and West Zones (Figure 6), indicates an average grade of 0.085 ozs. PGM/ton across a true width of 1100 feet.

Between Sections 505 and 512, and to a depth of 700 feet this would indicate 49,000,000 tons with an average grade of 0.085 ozs. PGM/ton. The northern extensions of the Central and West Zones remain to be drilled.

Diamond drilling of the Lac des Iles project was conducted by two contractors:

- (1) Ed Colbert
574395 Ontario Inc.
167 Lakeshore Lane
Timmins, Ontario
- (2) D and S Drilling
(Roger L. Dunge and J.E. Struthers)
137 Main Street
Kenora, Ontario

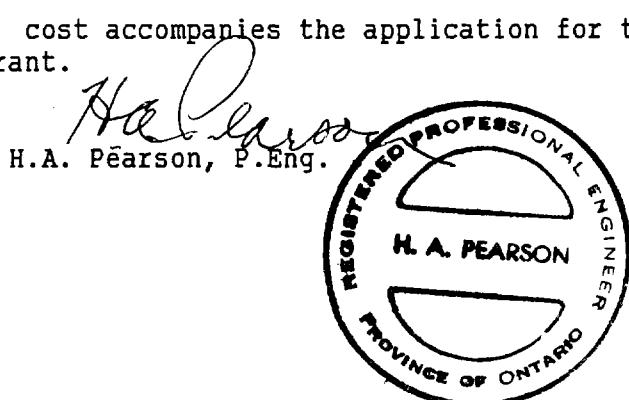

B. Trenching Programme

Approximately 935,000 cubic yards of trenching were completed over the Roby Zone to expose the ore and determine its limits for open pit production. The trenching also provided large bulk samples for metallurgical testing.

7. COST INCURRED

A total of \$4,857,498 was expended on the property during the period January 1, 1987 to December 31, 1987.

A breakdown of the apportioned cost accompanies the application for the Ontario Mineral Exploration Programme Grant.
