REPORT ON SOIL GEOCHEMICAL SURVEY

ROARING RIVER PROPERTY

NTS 52H/12

NORTHWESTERN ONTARIO

**THUNDER BAY, ONTARIO
JULY 7, 2003**

**CLINT BARR
GEOLOGIST**

SUMMARY

North American Palladium Ltd. entered into an option and joint venture agreement on the Roaring River Property with Lithic Resources Ltd. in April 2003. The property is located approximately 145 kilometres north of Thunder Bay, Ontario. During May of this year a total of 371 soil samples were sent to Accurassay Laboratories of Thunder Bay, Ontario for precious and base metal analyses. These samples had previously been collected during the 2001 summer field season and stored. Although soil samples were analysed in 2001 and 2002 this report deals only with the 2003 results.

1.0 INTRODUCTION

During the 2001 summer field season more than 1100 soil samples (including duplicates) were collected on the Roaring River Property. For the most part the samples were collected at 25m spacing on an established grid with 100m and 200m spaced lines although on a few lines south of Hwy 811 (Garden lake Road) the samples were 12.5m apart. The 12.5m spaced samples have never been sent for analyses and remain in storage along with a few spare duplicates and sporadic humus samples. The soil samples were submitted for analyses over a three-year period with 333 samples submitted in 2001, 390 samples in 2002, and a further 371 samples in May 2003.

A list of North American Palladium Ltd. personnel involved in the preparation of the samples and report is given in Appendix I. A statement of qualifications is supplied as Appendix II and Certificates of Analyses for submitted soil samples are reported as Appendix III.

2.0 LOCATION AND ACCESS (Figure 1)

The Roaring River Property (NTS 52H/12, Figure 1) is located approximately 145 kilometres north of Thunder Bay, Ontario. The property is accessed via Hwy 811 (Garden Lake Road) that bisects the claim group centred at Kilometre 55. Highway 811 is an all-season arterial gravel road used to access a network of other forestry roads and trails and begins approximately 115 kilometres north on Highway 527 leading from Thunder Bay to Armstrong, Ontario. The northern portion of the property is best accessed by boat via Bilkey Lake from the west side and the Roaring River system from the east.

3.0 CLAIM HOLDINGS AND PROPERTY DISPOSITION (Figure 2)

The Roaring River Property consists of twenty-five (25) contiguous claims totalling 322 units located in the Garden Lake (G-0721) and Gillard Lake (G-0722) areas within the Thunder Bay Mining District. After the claim additions completed in January of 2003 the total surface area of the claim group equalled 5432.5 hectares.

In April 2003 Lac Des Iles Mines Ltd. (“LDI”), a wholly owned subsidiary of North American Palladium Ltd. (“NAP”), entered into an option and joint venture agreement with Lithic Resources Ltd. (“Lithic”) formerly known as Berland Resources Ltd. (“Berland”) on the Roaring River Property.

A summary of the claim holdings is given in Table 1 below and a claim sketch is provided in Figure 2.

4.0 PREVIOUS WORK

A search of government archives did not produce any assessment work filed with the government prior to Berland's 2001 reports (two from McCrindle, 2001 and a third co-authored by Fingler and McCrindle, 2001). The 2001 reports cover grid cutting, prospecting, geological mapping, soil sampling, mechanical trenching, and ground geophysics (Mag, HLEM, IP). The only other assessment work filed is soil samples analysed in 2002 but collected in 2001 and cached in a warehouse (Staargaard, 2002).

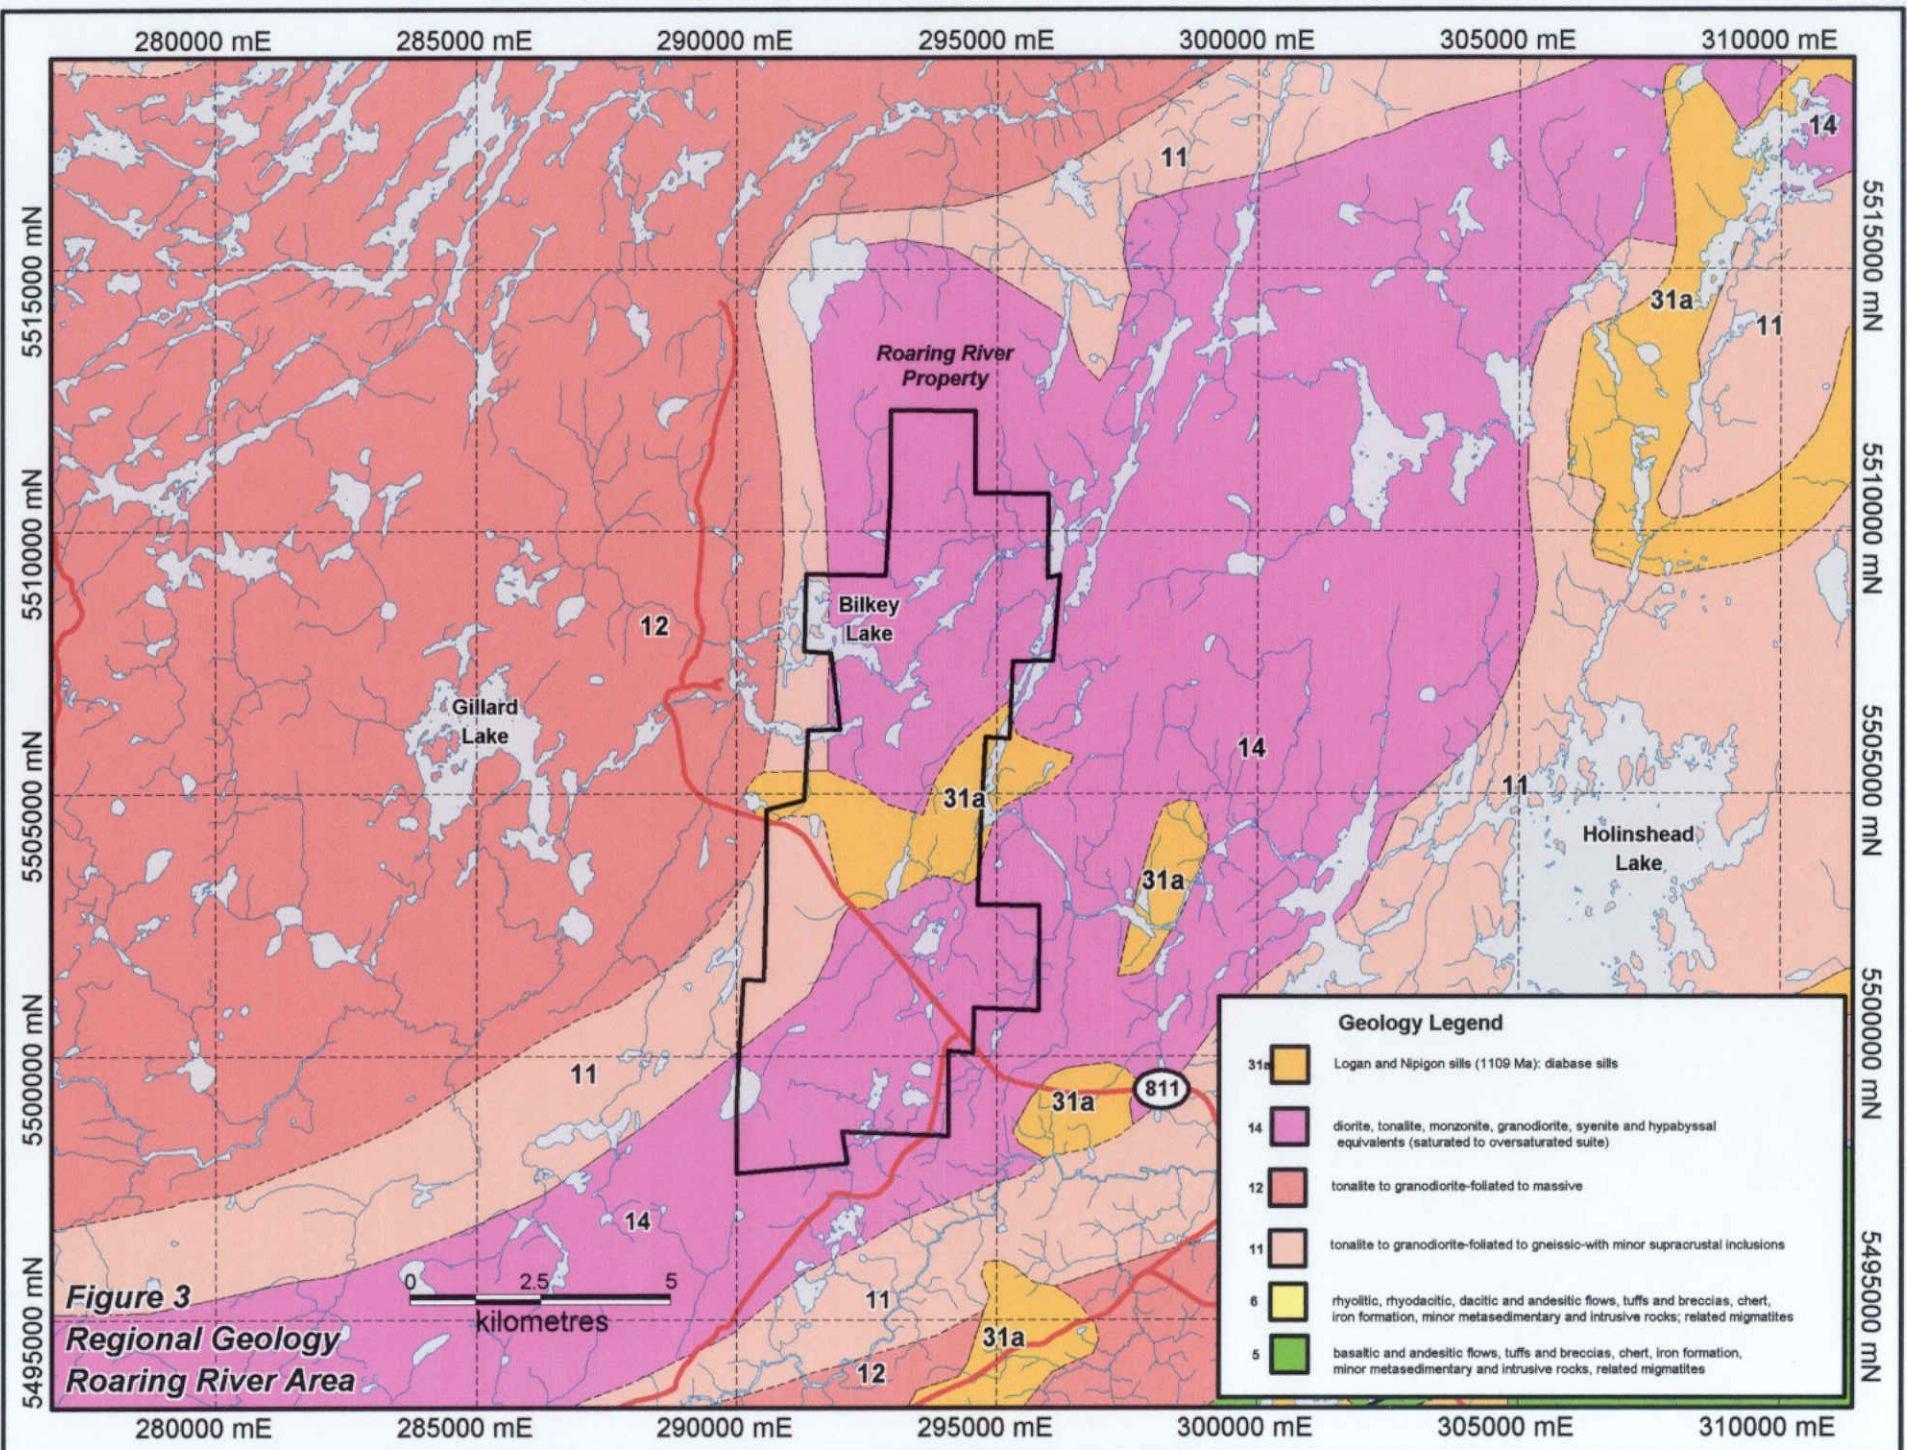

Other work completed in the area includes 1960's regional mapping by the government (Milne, 1964) and inclusion of the Roaring River Complex in a study completed on Archean "sanukitoids" (Stern et al, 1989; Stern and Hanson, 1991). In 2000 the OGS released a lake bottom sediment survey (Jackson and Dyer, 2000; OGS, 2000) and airborne geophysical survey (OGS, 2000) as part of the provincial Operation Treasure Hunt initiative.

5.0 REGIONAL AND PROPERTY GEOLOGY (Figure 3)

The Roaring River Property is located in the east west trending Wabigoon Subprovince bounded to the north by the English River and Winnipeg River Subprovinces and to the south by the Quetico Subprovince. The Wabigoon Subprovince belt measures approximately 900x150km consisting of metavolcanic and metasedimentary rocks surrounded and cut by regional scale granitoid batholiths. The property covers the Roaring River Complex considered part of a curved intrusive body and comprised of monzodiorite and related diorite, monzonite, and granodiorite phases. To date most of the work on the property has been centred over an interpreted mafic/ultramafic inclusion or raft within the Roaring River Complex (Stern et al, 1989 and Stern and Hanson, 1991). The 3x1.5 km inclusion straddles Hwy 811 and corresponds to an aeromagnetic high response noted on the OGS' airborne survey. The magnetic response on the airborne survey measures approximately 4.5x2.5km, is oriented north-northeast, and appears bisected by a similarly striking structure (OGS, 2000).

Geological mapping by Berland in 2001 has revealed outcrop to be sparse and thus so are contacts between various lithologies. Extensive fluvial outwash plains of sand and gravel and several long sinuous boulder-rich eskers cover most of the property. During the trenching program numerous pits tested various locations south of Hwy 811 on the grid but failed to reach bedrock at the maximum five-metre limit of the excavator. However the limited bedrock exposure and airborne magnetic response does appear to support the interpretation of a large mafic/ultramafic inclusion within predominantly felsic phases of the sanukitoid suite of rocks. The mafic/ultramafic inclusion consists mostly of mesocratic gabbro with a variable grain size (varitextured) ranging from fine-grained to locally pegmatitic. Brecciation appears local and consists either of mostly mesocratic varitextured gabbro clasts in a more mafic melanocratic gabbro to pyroxenite matrix or as contact injection-type breccias where the surrounding felsic phases of monzonite/granodiorite have intruded the gabbroic rocks as veins, fracture-fill or large irregular sweets.

All of the mineralized showings (Mere, Leigh, Leigh South, Leigh North, L102N, L116N, and L118N) occur within the interpreted boundary of the gabbroic rocks. Of these, two occur in bedrock (Mere, L102N) while the others are a series of mineralized boulders. The mineralization consists of pyrite and pyrrhotite with local concentrations of chalcopyrite and pentlandite. Results from sampling indicated that elevated base metal numbers (>0.1% Cu and Ni) did not necessarily correspond to high precious metal (Pt, Pd, Au) values. Grab samples returned values as high as 1.7g/t combined Pt-Pd-Au, Cu values up to 0.32% and Ni up to 0.2%. Channel sampling of the trenches and later prospecting programs were unable to reproduce most of the values with the exception of a few samples.

SOIL GEOCHEMICAL SURVEY

During the 2001 field season over 1100 soil samples were collected on the grid (Fingler and McCrindle, 2001). The samples were collected at 25m stations on both wing lines and base lines however some were collected at 12.5m stations which remain in storage. Most samples collected consisted of orange oxidized B-horizon material at a depth averaging 20cm and a few humus samples (not sent for analyses). The extensive sand and gravel deposits hamper development of a good soil profile, as do the wet swampy areas with thick decaying vegetation beds of predominantly moss. Of the samples collected in 2001 a total of 333 soils were analysed in 2001, another 390 soil samples in 2002 (Staargaard, 2002), and a further 371 samples in 2003 (this report).

The soils analysed in 2001 were submitted to Accurassay Laboratories of Thunder Bay, Ontario and analysed for platinum (Pt), palladium (Pd), and gold (Au) and 30 element ICAP analyses. Soils submitted in 2002 were also sent to Accurassay Labs for Pt-Pd-Au analyses using fire assay with an atomic absorption finish and 29 element ICAP with an aqua regia digest finish. Results for both sample sets have been filed for assessment (Fingler and McCrindle, 2001; Staargaard, 2002). During May of 2003 a total of 371 samples were also submitted to Accurassay for analyses. These soil samples were analysed to complete the coverage of the entire grid. The soils were screened through -80 mesh then fire assayed for Pt-Pd-Au with atomic absorption finish. Copper, nickel and cobalt values were obtained by a multi-acid digest (HNO₃, HF, HCl) prior to atomic absorption finish. The assay certificates are attached as Appendix III and a soil sample location map is provided as Map 1.

The vast majority of the soils analysed in 2003 returned values below detection limit for the precious metals. Very few samples also contained anomalous base metal values. Of the samples above detection limit there were a few local spot highs (L73N/9950N, L71N/9800E) and a few areas of several slightly gold values in a row (e.g. L75N/9400E to 9575E). In general, elevated values occur along or near the southern base line just south of Hwy 811 in the vicinity of the Mere Showing or further south in the vicinity of L71N to L75N. Duplicate samples submitted did not determine adequate reproducibility. Although the precious metal values were all below detection the base metal values appear to vary greatly based on the fact that some were two or three times the value of its' counterpart. However, it should be noted that the values are quite small in the order of 15-40 parts per million (ppm). Fingler and McCrindle noted in their 2001 report that reproducibility for the precious metals was poor and Staargaard (2002) noted that a batch of nickel results from the 2001 results were suspiciously higher than other batches by a factor of five. At the time of his report Accurassy was investigating the problem but as of this report no conclusion had been reached.

6.0 CONCLUSIONS

There would appear to be several problems associated with the soil survey completed on the Roaring River Property. First and foremost is the extensive overburden

and what affect the fluvial material and it's poorly developed soil profile poses. Another factor to be taken into account is the depth of the overburden itself. In general the soil values broadly appear to have responded better, or differently at least, in areas where the 2001 trenching program successfully reached bedrock (Pt and Ni in the Mere Showing area). This may reflect shallow overburden as opposed to highlighting underlying anomalous metal-rich areas. It should be noted that this scenario was not necessarily noted over areas of mineralized boulders. Furthermore the only other area successfully trenched and that contained anomalous precious values in rock was not covered by the soil survey (L102N Showing). Another problem may lie in the high detection limits of Pt and Pd, 15 and 10 ppb respectively, as mentioned by both Staargaard (2002) and Richard Dyer (Ontario Geological Survey, personal communication). In hindsight the attempt to reproduce values in duplicate samples may have been a wasted effort due to the detection limits. In Staargaard's report (2002) the multi-element analyses that included Cu-Ni-Co were finished using aqua regia digest whereas for the 2003 samples (this report) these same elements were obtained using atomic absorption finish. According to Accurassay the different methods should be comparable at the low end but exhibit greater variance when values reach 500ppm or more. Since the soil survey analytical results for the entire grid are now available they should be compiled together to determine what use they will be, if any, to guide future exploration efforts on the property.

STATEMENT OF QUALIFICATIONS

I, Clinton Barr, hereby certify that:

1. I am a practicing geologist with North American Palladium Ltd. in Thunder Bay, Ontario and reside at 2616 McGregor Place, Thunder Bay, Ontario.
2. I am a graduate of Lakehead University with a degree of H.B.Sc. Geology, 1991.
3. I am a Canadian Citizen.
4. I have practiced my profession full-time since 1989 and seasonally since 1985.
5. I do not have, nor do I expect to receive, directly or indirectly, any interest in the properties of North American Palladium Ltd.

Signature: Clinton Barr

Dear Sir or Madam

Submission Number: 2.25956
Transaction Number(s): W0340.01142

Subject: Approval of Assessment Work

We have approved your Assessment Work Submission with the above noted Transaction Number(s). The attached Work Report Summary indicates the results of the approval.

At the discretion of the Ministry, the assessment work performed on the mining lands noted in this work report may be subject to inspection and/or investigation at any time.

If you have any question regarding this correspondence, please contact STEVEN BENETEAU by email at steve.beneteau@ndm.gov.on.ca or by phone at (705) 670-5855.

Yours Sincerely,

A handwritten signature in black ink, appearing to read "Ron Gashinski".
