Introduction:

The Sturgeon Lake Area has been the scene of mining exploration for almost a hundred years. Numerous Gold Prospects have been discovered. It has only been in the last few years that systematic exploration has been undertaken.

Presently, several Properties in the area are being explored for Gold.

Mr. R. Roberecki of Riverton, Manitoba holds two claims on the east side of the north bay of Sturgeon Lake.

Location and Access

The Roberecki Claims are located in Northwestern Ontario, 30 km southwesterly from Savant Lake, Ontario.

It is most conveniently reached by outboard motor boat from camps along the northwest Part of the lake.

The Claims

The Property consists of two claims; Pa 612056 and Pa 612057. Both claims are in good standing.

Previous Work in Area

The claim block is situated between several small Past-Producers and showings. The area has been actively Prospected for Gold since the 1890's.

No work Prior to the Present owner is on file for the area covered by the claims.

Trenching and stripping has been carried out on the leased claim Pa 38180 adjoining to the north. A high grade Quartz vein carrying considerable chalcoprite was bulk sampled. No assay data is available. The wallrock is highly altered and Pyritized.

Selco carried out a base metal exploration in the late 1960's and early 70's in the area. One hole was drilled 400 feet east of the claim line. The drill log indicates diorite, andesite, a variety of felsic volcanics and Graphite were intersected. Sulphides were Present as was carbonatization. Silicification is not specified but would appear to be Present. Samples were taken but no assays are given. During this Period Gold assays were not routine determinations for most companies due to the general lack of interest in Precious metals.

Mistango carried out Geophysical and Geological surveys during the mid 1980's. Nothing of note was discovered.

E. Robenecki has done stripping, sampling and assaying on the claims. One sample returned 0.2 oz./ton Au across 3'. This sample appears to be from an east-west trending shear near the centre of the claims a few hundred feet south of Pa 38180.

Geology

According to U. G. S. Map 2420 the land Portion of the claims is underlain by mafic volcanics. Granite occurs along the shore of Sturgeon Lake.

The general trend of the volcanics is east-west to east northeast. The trend curves to almost due north within a claim width east of the claims. Parallel to the granitoid contact. The volcanics to the west are truncated by the intrusive granite.

Geophysical Surveys

Magnetic Surveys

The northeast part of the property exhibits a highly erratic magnetic pattern. At least part of this pattern is due to the alteration associated with the vein structure extending from Pa 38180. A tighter spacing will be required to better define the feature.

The very flat pattern over the west part of the claims particularly under the lake indicates the granite exposed on the shoreline continues westward. The lack of spikes indicate a very homogeneous intrusive.

The remainder of the claims exhibit a pattern typical of volcanic terrains. A more detailed survey may allow tracing of individual units within the volcanics. Magnetic lows within these volcanics may represent alteration zones.

VLF Surveys

Both surveys show a strong conductive zone in the northeast part of the property and a parallel weaker zone. They define a zone extending northeastward from Pa 38180 - likely the host structure for the high grade gold-bearing vein.

Over the remainder of the property the response is nil to very weak. The zone on Pa 38180 may continue westward but the response from the VLF is too weak to confirm this theory.

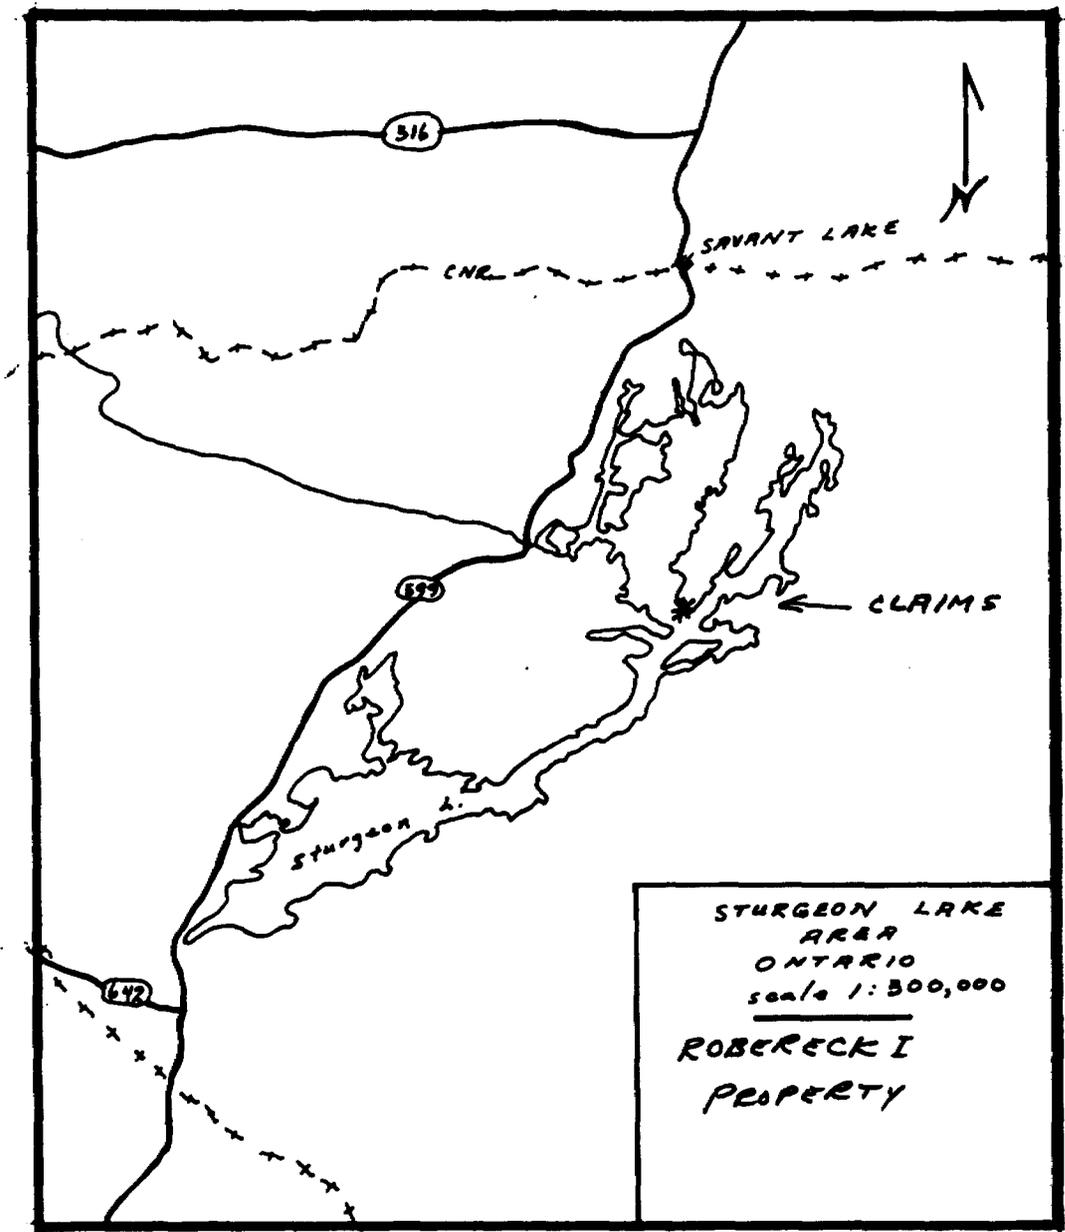

It is interesting to note that the VLF survey carried out on the property adjoining to the south was yielding positive in phase readings at the north ends of their lines. The present survey gave negative in phase readings at the south ends of the lines. It appears that a conductor lies in the vicinity of the common claim boundary.

Conclusions

1. The geophysics located a major anomaly in the northeast part of the property. This appears to represent the continuation of the mineralized zone on Pa 38180 .
2. The magnetics indicate the portion of the property covered by water is underlain by granite.
3. The geophysics did not pick up the zone in the centre of the claims.

Recommendations

1. Detailed prospecting and geological mapping are warranted both to better define the source of the northeast anomaly and to discover other mineralization which does not respond to geophysics.
2. Several VLF lines are warranted to clarify the location and character of the assumed conductor adjacent to the south boundary.
3. Stripping of the northeast anomaly should be done, followed by sampling and assaying. A trench on 1E from 0+75 to 1+50N will expose the entire width of the anomalous zone.
