INTRODUCTION

During the month of August, 1983, Cumberland Resources Ltd. operated a geochemical soil sampling program on the combined properties in Armit Lake, Grebe Lake and Houghton Lake Areas of Ontario. The properties are recorded in the name of Cumberland Resources Limited and owned through legal agreement by Cumberland Resources Limited, Thunder Bay, Ont. 50%; Vestor Explorations Limited, Richmond, B.C. 25%; and Redfern Resources Limited, Richmond, B.C. 25%. By agreement of the partners, Cumberland Resources Limited is the manager in charge of exploration on these properties.

This report is prepared to fulfil the requirements for the Ontario Mineral Exploration Program grant application.

The field survey party consisted of 4 men. The project was supervised by William McCrindle, geologist.

The Houghton-Island Lakes property consists of 2 separate groups totalling 53 unpatented mining claims situated in the Houghton Lake Claim map. The Shoehorn Lake property consists of 48 contiguous unpatented mining claims situated in the Armit Lake and Grebe Lake Claim maps. The Shoehorn Lake property is located 3 km. northeast of the Houghton-Island Lakes property.

The data contained in this report is derived from the analytical geochemical results determined for 501 samples; 226 from the Houghton-Island Lakes property and 275 from the Shoehorn Lake property. All samples were analysed for 26 elements by the ICP method at Min-En Laboratories in North Vancouver.

The geochemical data was plotted and contoured by hand. Geochemical maps for elements, arsenic, lead, molybdenum and silver are included with this report.

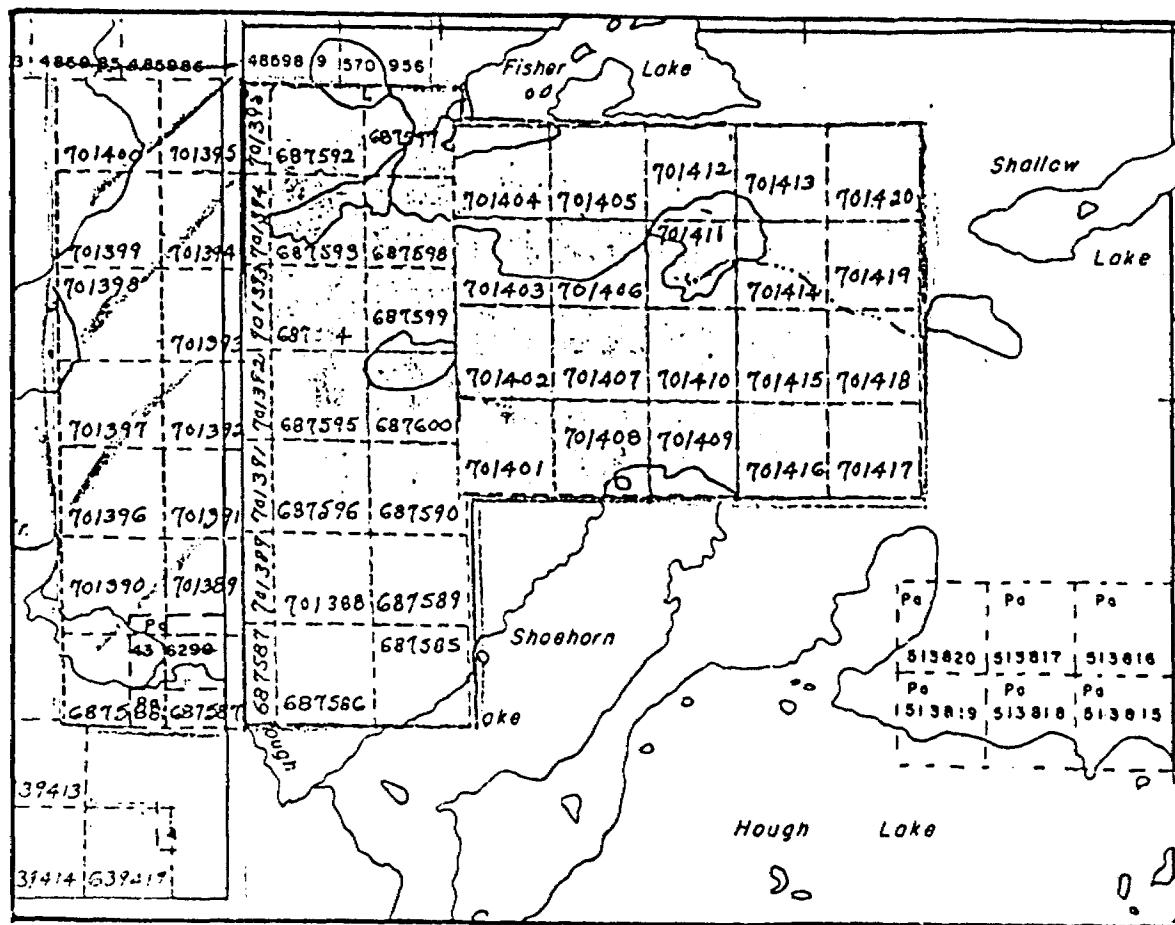

PROPERTY DESCRIPTION

The recorded holder of the properties is Cumberland Resources Limited of Thunder Bay. A total of 101 claims comprise these properties. The claims cover land that is similar in geological stratigraphy and structure and thus are considered together in this report. In the Houghton Lake Area, two groups of 25 and 28 contiguous unpatented mining claims comprise the Houghton-Island Lakes property and in the Grebe Lake Area, one group of 48 contiguous, unpatented mining claims comprises the Shoehorn Lake property. The two properties are held in good standing by Cumberland Resources Limited on extension until October 31, 1984. In May of 1984, an airborne geophysical survey was conducted by Dighem Corporation of Toronto.

All claims were recorded in March and April, 1983. The claim groups are outlined on the Armit Lake Area claim map #M2744 and Grebe Lake Area claim map #1804 (Map A) and Houghton Lake Area claim map #M2165 (Map B), of the Ontario Ministry of Natural Resources in the Patricia Mining Division.

The claim numbers are as follows:

<u>Claim number</u>	<u>Number of Claims</u>	<u>Recorded Date</u>
Western group, Houghton-Island Lakes property-Houghton Lake Area M2165		
Pa659511-659513 inclusive	3	April 6/83
Pa659515-659516 inclusive	2	April 6/83
Pa659525-659516 inclusive	5	April 6/83
Pa701421-701435 inclusive	15	April 6/83
Eastern group, Houghton Lakes property-Houghton Lake Area M2165		
Pa701301-701320 inclusive	20	March 21/83

LOCATION AND ACCESS

The properties are located south of Kashawegama Lake, approximately 15 km. north and northwest of the village of Savant Lake, Ontario. The western and eastern claim groups of the Houghton-Island Lakes property are situated at the northeast corner of Houghton Lake and the west end of Island Lake, respectively. The distance between the two claim groups is 3 km. The Shoehorn Lake property is adjacent to the north and west portions of Shoehorn Lake. The property locations are shown on Map C.

The Houghton-Island Lakes property can be reached by conventional vehicles via gravel pulpwood haul-road trending north from Marchington Road. Marchington Road extends eastward from Sioux Lookout, Ontario and joins that town with Highway 599 approximately 8 km. north of the village of Savant Lake. The east end of the Shoehorn Lake property is situated 4 km. west of Highway 599 and is accessible via Shoehorn, Fisher and Kashawegama Lakes road.

PHYSIOGRAPHY AND VEGETATION

The properties are located within the Canadian Shield Physiographic Belt of Canada. Relief is low and outcrop exposures are sparse and confined to small moss-covered projections through the glacial overburden. At the Houghton-Island Lakes property, the eastern portion of the east claim group is covered with extensive deposits of glacial till and gravel deposits of unknown thickness.

Water is readily available from Fisher Lake, Shoehorn Lake, Hough Lake, Island Lake, Houghton Lake and several smaller unnamed lakes within the confines of the properties.

HISTORY AND PREVIOUS WORK

The general area has been explored for precious, ferrous and non-ferrous metal bearing deposits since the turn of the century. Subsequent to the discoveries of viable massive sulphide base-metal deposits at Sturgeon Lake during 1969 and 1970, the Savant Lake area was extensively investigated for similar occurrences. Airborne and ground geophysical surveys were followed with the testing of anomalies by short, mostly isolated diamond drill holes. No economic base metal deposits were discovered.

The Houghton-Island Lakes claim blocks are contiguous or close to properties upon which geophysical anomalies have been found. Conductive material was encountered during a horizontal loop electromagnetic survey by Noranda Exploration Company Limited on a group of mining claims situated between the two claim blocks. The east-west conductor axes were not delineated along strike. A single short diamond drill hole encountered massive sulphides containing insignificant base-metal values.

Umex Corporation Limited drilled one hole on what is now claim Pa701427 in the western block of the Houghton-Island Lakes property. The core contained approximately 46 metres of dacitic tuff and associated volcanogenic sediments all containing disseminated sulphide minerals.

REGIONAL GEOLOGY

The general geology of the Savant Lake properties is shown on map #2424 "Houghton Lake-Hough Lake Area", published in 1980 at a scale of 1"= $\frac{1}{2}$ mile. This map accompanies Ontario Geological Survey Geological Report #195 by W.D. Bond.

The area straddles the contact of the English River Subprovince and the Wabigoon Subprovince, and falls largely within the Wabigoon Subprovince. All of the bedrock underlying the area is of Early Precambrian (Archean) age and is overlain by unconsolidated Quaternary glacial, glaciofluvial and recent deposits. The area has been complexly deformed by both faulting and folding.

PROPERTY GEOLOGY

The Houghton-Island Lakes property is underlain by metavolcanic rocks varying in composition from mafic through intermediate to felsic with the latter two predominating. The majority of the rocks are fragmented and tuffaceous with some fine grained flow facies.

The Shoehorn Lake property is underlain by metavolcanic rocks similar in composition and facies characteristics to those at the Houghton-Island Lakes property. At the former property, several metasedimentary horizons are interlayered with the metavolcanic rocks. The metasedimentary rocks range from clastic (sandstone, siltstone) to chemical (iron formation) in composition.

The metavolcanics and metasediments occupy the west limb of an isoclinally folded anticlinal sequence that faces north and east and plunges 50 to 70 degrees to the east-northeast. Within the property boundaries, the bedding and schistosity directions are primarily at azimuths of 80 to 100 degrees with steep dips.

GEOCHEMICAL SURVEY PROCEDURES

During the month of August 1983, Cumberland Resources Limited operated a geochemical soil sampling crew on the combined properties in the Armit Lake, Grebe Lake and Houghton Lake Areas of Ontario. A total of 501 samples were obtained from 101 claims; 226 samples along 12.6 km of north-south claim lines at the Houghton-Island Lakes property, and 275 samples along a combined 11.2 km of north-south claim lines and 2.0 km of grid lines at the Shoehorn Lake property.

The above mentioned grid was established over portions of claim numbers Pa701401, 701402, 701407 and 701408 where a rock sample from glacial float showed strong mineralization. A baseline with an attitude of 090° was cut over a 400 metre length. The grid system consisted of 5 crosslines, each 400 metres in length, cut and picketed at 100 metre intervals. Pickets were placed at 25 metre intervals on the crosslines. Samples were taken at each station on the crosslines.

Geochemical samples were systematically selected from the "B" soil horizon by digging a hole in the soil profile with a grub hoe. The hole was then cleaned out by hand and an earth material sample of approximately 500 grams was placed into a 10 cm x 17 cm wet strength waterproof kraft sample bag. The samples were later dried thoroughly in the sun.

GEOCHEMICAL ANALYTICAL PROCEDURE

All samples were forwarded to Min-En Laboratories Limited, 705 West 15th Street, North Vancouver, B.C. V7M 1T2 for analysis. Each sample was sieved and the -80 mesh component was analysed. The method of analysis was 26 element inductively coupled argon plasma. The assays were reported in P.P.M.

The detection limits are as follows:
1 PPM for Ag, Cd, Co, Cu, Mn, Pb, Ni, Sr, Zn, Mo, Se,
3 PPM for As, Sb, U, Th, B, Bi, V, Ba
0.001% for Al, Ca, Fe, K, Mg, Na, P

The geochemical data was plotted and contoured on the basis of background and anomalies. Selected elements, arsenic, lead, molybdenum and silver are included with this report.

GEOCHEMICAL MAP INTERPRETATION

At the Houghton-Island Lakes property, anomalies outlined to date tend to be weak and isolated, with the exception of one zone on line Q which returned a maximum assay value of 31.3 PPM silver. Prospecting is required to check for a favourable host rock structure.

At the Shoehorn Lake property, a coincident arsenic and molybdenum anomalous zone has been traced northwest from the southeast corner of claim number Pa701407, across the northeast portion of the detailed grid system through to the west boundary of claim Pa701407. This anomalous zone is situated 200 to 300 metres north and northeast of a previously discovered angular boulder of lapilli tuff which assayed 5.67% MoS, 3.49 oz/ton silver and 0.087 oz/ton gold.

A second coincident arsenic and molybdenum anomalous zone has been outlined on claim numbers Pa701413 and 701420 in the northeast portion of the Shoehorn Lake property. The remaining anomalies tend to be isolated. No anomalous silver values have been obtained from this property.

CONCLUSIONS AND RECOMMENDATIONS

The Houghton-Island Lakes and Shoehorn Lake properties warrant further detailed examination. All soil geochemical anomalies must be investigated on the ground.

All claim groups have been flown with airborne geophysics to evaluate for deeper seated massive sulphide deposits and to outline marker horizons of iron formations for stratigraphic interpretation.

The next phase of exploration should involve detailed geological mapping and prospecting in the vicinity of all soil geochemical anomalies. In addition, the Shoehorn Lake grid should be extended 300 metres to the north and 200 metres to the west. Detailed geochemical soil sampling should be carried out over the grid extension to further define the coincident arsenic and molybdenum anomalous zone. Detailed geological mapping should be undertaken over the full extent of all the grid system.

If warranted, further investigations would involve ground geophysical surveys followed by diamond drill testing of favourable geophysical, geochemical and/or geological targets as recommended in Bartley's report, "Report on Cumberland Resources Limited Savant Properties, District of Thunder Bay, Ontario, (1983)".

QUALIFICATIONS

I, Gordon Steinert, of 42 Hull Ave., Thunder Bay, Ontario hereby certify:

1. I am a graduate of Lakehead University (1975) and hold a B.Sc. degree in geology.
2. I have been employed in my profession by various mining companies for the past 10 years.
3. I am presently employed as a geologist with Cumberland Resources Limited, Thunder Bay, Ontario.
4. The information contained in this report was obtained from the analysis of the geochemical samples and from those articles listed in the bibliography.
5. I have no direct or indirect interest in the property described nor in the securities of the Companies.

dated at Thunder Bay, Ontario,
May 9, 1984.

Gordon Steinert

Gordon Steinert,
Geologist.

Attention: John Barakso

Dear John:

Re: 26 Element ICP

As indicated to you by telephone we have serious concerns regarding the accuracy of our ICP results, particularly those for reports dated from September 7 through September 23, 1983. As you know we had a number of samples rerun. Although some of them correspond not too badly with the original values, others are so badly out that we are concerned about our results in general. For comparative purposes I have enclosed copies of the original values and reruns for the samples checked to date.

In scanning the data, there are a number of September reports which will have to be checked and these are particularized below:

File 3-892S/P1 + 2 - September 7

The upper half of the page has high Ag, As and U relative to the lower half. Please check samples X38035 through A37000.

File 3-892S/P3 + 4 - September 8

Please check the interval from B33050 through B34070 and also sample B34095.

File 3-900/P1 + 2 - September 12

Elements Ag, As, U, Sb, Pb, Mo, Se, all oscillate from high to low to high etc. going down the page. Spot check the high values to ensure they are correct particularly intervals 13010N to 13030N and 09035N to 11027N.

File 3-900S/P3 + 4 - September 12

Ag, As and U seem to increase and decrease. Spot check high values particularly 01010 N to 12022N.

Min-En Laboratories
Page 2

File 3-917S/P1 + 2 - September 12

Spot check the highs particularly 07007S and 07022S.

File 3-819S/P1 + 2 - September 5

There are minor variations in As, Ag, U and Pb please spot check.

File 893/P1 + 2 - September 8

The upper half of the page has high Ag, As, U, Pb and Sb. Previous spot checks we had done show values are in error. Please rerun the interval 00050S to 10025S.

File 3-893S/P3B - September 8

All of these values we believe are wrong. Please rerun interval 30125N to 30175N.

File 3-951S/P1 + 2 - September 23

Please spot check.

File 3-951S/P3 + 4 - September 23

Please spot check including sample B13030.

File 3-951S/P5 + 6 - September 23

Please spot check and include samples B15105 and R23055.

File 3-951S/P7 + 8 - September 23

Please spot check highs including sample Q08090, Q08050 and Q23205.

File 3-951S/P9 + 10 - September 23

Please spot check.

File 3-951S/P11 + 12 - September 23

Please spot check, include sample F97225.

File 3-951S/P13 + 14 - September 23

Please spot check, including sample E02090.

File 3-951S/P15

Please spot check and include sample E04030.

I think I have included all the reports where I suspect that there is a problem. I think the results in the reports dated July and August, 1983 are probably okay at least judging by the appearance on the page and the way they plot on the maps. I hope that with the above reruns we will have

Min-En Laboratories
Page 3

identified most of the problem areas. I look forward to hearing from you
and please contact me regarding the delivery of the pulps.

Yours truly,

CUMBERLAND RESOURCES LTD.

JAG

ANALYTICAL REPORT

Project Savant Lake Shoehorn Date of report Sept. 8/83.
Property

File No. 3-893 Date samples received Aug. 29/83.

Samples submitted by:

Company: Cumberland Resources

Report on: 71 soils Geochem samples

Assay samples

Copies sent to:

1. Cumberland Resources, Richmond, B.C.
2.
3.

Samples: Sieved to mesh - 80 Ground to mesh

Prepared samples stored discarded

rejects stored discarded

Methods of analysis: 26 ICP Analysis.

Remarks:

RECEIVED JULY 1971 FROM WALTERS LIBRARY UTAH STATE UNIVERSITY
AMERICAN JOURNAL OF MEDICAL GENETICS
