Figures, maps and appendices

1. Summary

The objective of the summer 2001 program was to complete reconnaissance mapping and sampling of Goldcorp Inc.'s Trout Bay property grid and to begin reconnaissance mapping and sampling of the Middle Bay and Pipestone Bay properties.

Mapping on the Trout Bay grid network was done at a 1:2500 scale while mapping on the Middle Bay and Pipestone Bay properties comprised shoreline mapping with inland traverses. The samples collected were sent for whole rock analysis (XRF) or for 22 element (Au-ICP) assay to create a representative database of the rocks on the properties and to determine their mineral potential.

Platinum group element (PGE) mineralization is found in the central portion of the Trout Bay property. The PGEs are found in contact zones between iron formation and mafic volcanic rocks and gabbros. The extension of this horizon was located at only one outcrop in the south part of the property. An extension was also mapped in the northwestern part of the property (southwest of TL-089+00N). This banded iron formation (BIF) did not return any significant platinum (Pt) or palladium (Pd) results. There were two samples, taken from old trenches in the northwest part of the property (on L-055+00E), that returned up to 3.2 g/t gold and up to 15100 ppm zinc from disseminated pyrite (py), chalcopyrite (cp) and sphalerite (sp) mineralization. The host to this mineralization is felsic volcanic tuff. Lack of exposure in the northwestern part of the property make geophysical data a very useful aid for exploration.

The Middle Bay property, located north adjacent of Trout Bay, is transected by several shear zones and has been extensively hydrothermally altered. Four samples with over 1 g/t (up to 9.1 g/t) were collected within these. The shear zones are found in mafic to ultramafic volcanic hosts that contain multiple iron carbonate, quartz and quartz ladder veins. The mineralization consists of disseminated sulphides (py, cp) as well as some sulphide veinlets.

The Pipestone Bay property is a probable ultramafic intrusion that was sampled for its possible PGE potential. A mag low and gravity anomaly is located at the center of the bay. A large number of samples were collected for whole rock analysis. The results will be used to help determine if the intrusion is layered, fractionated, and depleted or enriched in certain elements. The assay samples collected did not return significant Pt or Pd values.

It is recommended that more detailed work be done on the Middle Bay property. This should include additional sampling, detailed mapping on cut grid lines. A detailed look at the

geochemistry of the ultramafic rocks surrounding Pipestone Bay is suggested, as well as drilling to determine the mineral potential at depth and the geology under the bay. Additional mapping and sampling is suggested for the northwestern part of the Trout Bay property to better define the geology surrounding the trenches on L-055+00E and the BIF southwest of TL-089+00N.

2. Introduction

With the help of an assistant, the author spent the 2001 field season performing reconnaissance mapping on Goldcorp Inc.'s properties in the west-end of the Red Lake greenstone belt. The first part of the summer focused on completing reconnaissance mapping of the Trout Bay property that was not finished during the previous year. This work was aimed primarily at finding and mapping the extension of the PGE target located in the central portion of the Trout Bay property and worked on during the previous year. The latter part of the summer and fall focused on beginning reconnaissance work on the Middle Bay and Pipestone Bay properties.

Mapping on the Trout Bay property consisted of detailed grid line mapping at a 1:2500 scale as well as collecting samples for both whole rock analysis (XRF) and assay. Mapping on the Middle Bay and Pipestone Bay properties consisted mainly of shoreline mapping and inland traverses with the purpose of locating outcrops and sample collecting for both XRF analysis and assay.

This report summarizes the work performed during the 2001 field season by describing the lithologies mapped and the mineralization encountered. Recommendations for future work are also included.

3. Property Description

3.1 Access

The Trout Bay, Middle Bay and Pipestone Bay properties are located to the west of the town of Red Lake (Fig. 1). The southern and central portions of the Trout Bay property, located approximately 26km west of the town of Red Lake, are accessible via Highway 618 to Madsen and then along the gravel and packed dirt Suffel Lake Road (also called Flat Lake Road). The grid network can be accessed directly from Suffel Lake Road or other small dirt roads. However, some areas in this part of the property can only be accessed by crossing creeks or with the help of an ATV.

The northwestern portion of the Trout Bay property is accessible by boat from the town of Red Lake or from Black Bear Lodge located on Suffel Lake Road. This fishing camp provides the closest access to the grid network and is only a 20 minute boat ride from the grid. The furthest lines from Trout Bay are accessible from MacIntosh Lake Road. Heading north along Nungessor Road, turn left onto Pine Ridge Road after about 17km. Drive about 52km along Pine Ridge Road and then turn left onto MacIntosh Lake Road. Continue for about 11 km until the intersection with the baseline. A few parts of the Trout Bay property have recently been clear cut providing good outcrop exposure and relatively easy access.

kilometres

The Middle Bay and Pipestone Bay properties can only be accessed via boat in the same way as the northwestern portion of the Trout Bay property is accessed. There is no direct road access to these two properties.

3.2 Topography and Vegetation

The topography of the southern portion of the Trout Bay property is relatively flat terrain comprising rolling hills. The vegetation consists mainly of balsam, spruce, jackpine and muskeg. Most of the balsam is dead due to the passage of spruce budworm, and in areas of high balsam concentration the trees have been blown down making it very difficult to walk through the forest.

The northwestern portion of the Trout Bay property has high ridges with steep slopes, some rolling hills and many flat areas. The topography ranges from 350m above sea level at the lake edge to 411m above sea level at the top of the highest ridges. There is one major fault in the area that has created near vertical cliffs up to 10m high. There are other areas with steep slopes. These topographical features could make it difficult for drills to be brought into the area during future drilling programs. The vegetation to the northeast of the baseline consists mainly of spruce and moss covered forest floor whereas to the southwest of the baseline the vegetation consists mostly of mixed vegetation including spruce, jackpine, balsam, birch and some meter-high bushes as well as muskegs and swamps.

The topography of the Middle Bay and Pipestone Bay properties is low because of their proximity to the lake. There is usually no more than a 20m elevation gain. Some of the reefs in Middle Bay that have historically shown high Au values can only be sampled at low water levels. Water levels also affect a large portion of the Pipestone Bay property because much of it is located on the shoreline.

3.3 Land Status

This mapping project covers three properties: the Trout Bay, Middle Bay and Pipestone Bay properties. The Trout Bay property is made up of nine claim groups (204, 204A, 204J, 204F, 204A, 204B, 204E, 204G, 204D, and 204K) covering an area of 5336.357 hectares (Fig. 2, 3, 4). The Pipestone Bay property is composed of 6 claims (claim group 210) covering an area of 464 hectares (Fig. 2). The Middle Bay property is made up of claim groups 204M, 204L, 204I, 204H, and 204C as well as claims KRL40860, KRL40861, KRL40862, KRL40863, KRL40864, KRL40865, KRL46181, KRL46182, KRL46183, KRL46184, KRL47707, KRL47708, KRL49900, KRL49902, KRL49904, KRL52174, KRL52175, KRL53397, KRL53398, KRL53399, KRL1234081 (Fig. 2). It covers an area of 829.592 hectares. To see a list of claim groups and claims for the properties see Appendix 1.

4. Previous Work

The properties mapped during the 2001 field season have been variably explored, with many claims having no record of previous work while others have been repeatedly explored. Considering the large area covered for this report and the large number of claims only a brief summary of previous work will be presented here.

4.1 Regional scale work

The Red Lake greenstone belt has been mapped several times by governmental agencies. The first work to address the entire belt's geology was by Horwood who prepared a map and report for the Ontario Department of Mines (ODM) (see Horwood, 1940). R.A. Riley and his assistants produced township scale geological maps of Ball and Mulcahy townships in the late sixties and early seventies for the ODM (see Riley, 1975, 1976). The Ontario Geological Survey (OGS) completed an airborne magnetometer and electromagnetic survey in 1978. The Geological Survey of Canada (GSC) produced a detailed study on the geochemistry and structure of the belt during the summers of 1999 and 2000 as part of NATMAP (see Sanborn-Barrie et al., 2001). The OGS completed a mineralization and wall rock alteration report for the belt during the summer of 2000 (see Parker, 2000a, 2000b).

4.2 Previous work in the southern portion of the Trout Bay property (Mulcahy Township)

Newcomex Canadian Exploration mapped, drilled and performed magnetometer, self-potential and vertical loop electromagnetic surveys to the south and west of Johnson Lake in 1962. Cochenour Willans Gold Mines Ltd. drilled in the same area in 1965. Texasgulf Canada Ltd. performed magnetic, horizontal loop electromagnetic (HLEM) and very low frequency (VLF) surveys over Leitch Lake during the winter of 1979.

4.3 Previous work in the northwestern portion of the Trout Bay property (Ball Township)

In 1963, Cochenour Willans Gold Mines put in a grid network and in 1965 drilled east of Thiel Lake. In 1979, Dome Exploration (Canada) Ltd. performed magnetometer and electromagnetic (EM) surveys on the same group of claims whereas Minorex Ltd. mapped and performed magnetic and EM surveys on claims closer to Trout Bay. In 1981, Dome Exploration (Canada) Ltd. drilled on part of Goldcorp Inc.'s property west of the Miles Red Lake Mine. In 1984, Minorex drilled the same claims they worked on in 1979. Noramco Explorations Inc. and Inlet Resources Ltd. drilled and conducted a VLF survey southwest of Dean Creek in 1987. In 1988, these two companies conducted an IP survey in the same area. In 1989, Noramco Explorations Inc. and Golden Day Mining Explorations Inc. sampled humus for geochemistry,

mapped, and drilled the same area. In the fall of 2000, Sial Géosciences Inc. flew combined magnetic, EM, VLF and radiometric helicopter surveys for Goldcorp Inc. over the Trout Bay property.

4.4 Previous work in the Middle Bay area (Ball Township)

In 1934, after a drilling program the year before, the May-Spiers Gold Mining Syndicate was formed, and by 1937 a 3 compartment vertical shaft was sunk on an island in Middle Bay to a depth of 375ft with 2 drifts at the 225 and 350ft level. After mining began however, the grade was lower than expected (0.09 oz/ton compared to 0.32 oz/ton found in surface drilling) and mining was stopped the same year. The Dumont Nickel Corporation then mapped, drilled and conducted proton magnetometer and VLF surveys on the May-Spiers property during 1980-82. In 1996, Hemlo Gold Mines Inc. performed IP and total field magnetic surveys on the property.

In 1963, Cochenour Willans Mines Ltd. mapped, trenched, drilled and, performed self-potential and magnetometer surveys on the Pipestone Narrows property located near the entrance of Middle Bay. From 1965-69, Cochenour Explorations Ltd. also drilled the property. In 1988, Shane Resources mapped, drilled and performed humus geochemistry on the property. In 1993, A. Maciejewski stripped, blasted, and performed magnetometer and HLEM surveys. And, in 1995-96, Battle Mountain Canada Ltd. mapped the property at a 1:5000 scale, sampled and performed magnetometer and IP surveys.

4.5 Previous work at the entrance of Trout Bay (Ball Township)

In 1944, I. Kornell trenched and drilled on Galena Island. In 1949, Lake Bed Lead Syndicate also trenched and drilled on the island. Cochenour Explorations Ltd. drilled West Narrows in 1965-66. In 1980, Dome Exploration (Canada) Ltd. drilled NE of Galena Island.

4.6 Previous work in the Pipestone Bay area (Ball Township)

In 1966, Cochenour Explorations Ltd. drilled some of Goldcorp Inc.'s claims in Pipestone Bay. Gold Fields Resources Canada Ltd. performed a VLF survey on parts of the Pipestone Bay property in 1981. In October 2000, Sial Géosciences Inc. flew combined magnetic, EM, VLF and radiometric helicopter surveys for Goldcorp Inc. over most of Pipestone Bay.

5. Geological Setting

The Red Lake greenstone belt is part of the Uchi Subprovince of the Archean Superior Province. It is composed of 7 volcano-sedimentary assemblages that range in age from 2.99 to 2.70 Ga representing multiple episodes of magmatism, crustal growth, and erosion (see Sanborn-Barrie et al., 2001). The three relevant assemblages for this property are the Balmer, the Ball and

the Trout bay assemblages. The oldest, the Balmer assemblage (2.99-2.96 Ga), and the second oldest, the Ball assemblage (2.94-2.92 Ga) form part of the North Caribou Terrane. The Balmer assemblage dominates the belt and is characterized mainly by submarine tholeiitic basalts intercalated with komatiites, komatiitic basalts and, minor felsic volcanics, iron-formation and fine-grained clastic rocks. The Ball assemblage, which covers the Pipestone Bay and Middle Bay properties, is comprised mainly of calc-alkalic basalts, andesites, dacites and rhyolites. Intercalated with these rocks are minor komatiite and komatiitic basalt flows, conglomerates, quartzites, and locally stromatolitic marbles. The Trout Bay assemblage (2.85 Ga), which covers most the Trout Bay property, is comprised of basalts overlain by clastic rocks, intermediate tuffs, and chert-magnetite iron-formation, all intruded by gabbro and ultramafic rocks. Several intrusive bodies, namely the Killala-Baird batholith (2.704 Ma), the Douglas Lake pluton (2.734 Ga) and the Hammell Lake pluton (2.717 Ga), surround the three properties.

A structural interpretation of the Red Lake greenstone belt is described by Sanborn-Barrie et al. (2001). The belt has undergone at least three deformations: a nonpenetrative deformational event (D_0) occurred pre-2.748 Ga, and at least two ductile events occurred after 2.742 Ga volcanism (D_1, D_2). The primary textures of the rocks have, in general, been preserved. There are however, heterogeneous strain corridors in the belt and the one that extends from Cochenour to Balmertown, for example, is host to the gold deposits of the Campbell and Red Lake Mines. The main fabrics in the west end of the belt are oriented in a general northwest direction and are steeply dipping.

6. Property Geology and Mineralization

6.1 Geology of the southern portion of the Trout Bay property (Mulcahy Township)

The main focus of mapping on the southern and northwestern parts of the Trout Bay property was to find an extension to the PGE target located in the central Trout Bay area. The target, an amphibole facies iron formation (AFIF), has elevated Pd, Pt, copper and nickel with the highest values found where the AFIF is in contact with mafic to ultramafic volcanics. The AFIF is not a typical BIF. This name is used to characterize its mineralogy and not the degree of metamorphism it was subjected to. It is an amphibole-rich iron formation with 2-70% magnetite and rare chert beds. Typically, it is composed of weakly to moderately bedded amphibole (+/- quartz (intergrowths)) and magnetite (+/- tremolite +/- serpentine) with the amphibole making up to 90% of the unit locally. The matrix of the AFIF can be tremolite-, chlorite- or quartz-rich. For a more detailed description refer to Hughes' report (2001). Only one BIF outcrop was mapped in the southern part of the Trout Bay area but it did not appear to be an AFIF.

In general, the rock types mapped in the south portion of the Trout Bay property agree with the ODM Mulcahy Township geology map. The rocks have undergone varying degrees of

gneiss and migmatite formation due to the intrusion of the Killala-Baird batholith and the Douglas Lake pluton. Associated with this is potassic alteration. The rocks are non-magnetic except in the presence of pyrrhotite (po). Carbonate alteration is only found locally. See Detail Map 1.

6.1.1 Felsic to intermediate intrusives

The majority of outcrops in southern Trout Bay are felsic to intermediate intrusives, dominated by diorite and quartz diorite. They are usually medium-grained and light pink to white on the weathered surface. Hornblende, often altered to biotite, is the mafic phase with variable amounts of quartz present. They are often heterogeneous with many having xenoliths of recrystallized mafic volcanics and ultramafic intrusives. The xenoliths vary in size from a few centimeters to several meters in diameter. The major alteration seen in these rocks is potassium feldspar-epidote veining.

6.1.2 Mafic volcanics, gabbros and amphibolites

The mafic volcanics are medium green, fine-grained, massive to weakly foliated and, composed mainly of amphibole (actinolite or tremolite) and plagioclase. The amphibole crystals have often altered to biotite.

The gabbros are dark green, medium-grained, massive to gneissic and composed of actinolite and plagioclase. They are often recrystallized mafic volcanic rocks, especially near contacts with the intrusives. In this case they were described as metagabbros. The glomerophyric gabbro used as a maker horizon in central Trout Bay is found at three outcrops in this part of the mapping area. The glomerophyric gabbro outcrops are massive and homogeneous and contain large plagioclase crystals (at least 1cm in diameter) that comprise up to 60% of the composition of the rock. The matrix is finer grained amphibole or pyroxene.

The amphibolites are brownish-green on the weathered surface, coarse-grained, massive and composed mostly of acicular crystals of actinolite or tremolite-chlorite-serpentine that are up to 2cm in length.

The extent of the mafic volcanics on L-163+00E, TL-082+00N and L-169+00E is less than shown on the ODM Mulcahy Township map. Much of what was mapped as mafic volcanic in this area appears to be felsic to intermediate intrusives containing xenoliths of recrystallized mafic rocks. Near the intersection of TL-052+00N and L-140+50E there are more mafic, gabbro and amphibolite outcrops than previously mapped. The amphiboles found in the mafic rocks in this area are mostly hornblende, atypical of the mafic volcanics in the rest of the area.

6.1.3 Sediments and chemical sediments

Very few sedimentary rocks were mapped. These are mostly biotite-rich fine-grained mafic volcanic derived wackes. Due to their mafic volcanic origin and small grain size it is possible that some of the sediments were mapped as mafic volcanics.

One large BIF raft, possibly in-situ because it lines up with the overall trends in the area, was mapped within diorite and was a few meters in size. This oxide facies iron formation is highly metamorphosed, has 2% magnetite in centimeter scale bands as well as gruneritized amphibole and granoblastic quartz.

6.1.4 Mineralization

The mineralization in this area, usually associated with mafic volcanic rocks and quartz veins, consists mostly of py and pyrrhotite (po). These sulphides occur as disseminated fine-grained crystals that are found only locally and in very small quantities (<<1%).

6.1.5 Structure

The structure in the area is greatly affected by the emplacement of the Douglas Lake pluton and Killala-Baird batholith. The rocks are gneissic, massive or weakly foliated with higher strained rocks being flattened, isoclinally folded, and having a stronger foliation. The fabrics in the area strike between 310° and 40°. In general however, the main fabrics trend about 345° and 35°. The greatest variations are found in the intrusive rocks where gneissic banding is highly variable.

6.2 Geology of the northwestern portion of the Trout Bay property (Ball Township)

The extension of the AFIF was not found in the northwestern part of the Trout Bay property. However, a BIF was mapped that could possibly be the extension of the AFIF of central Trout Bay. The rocks in this area are relatively undeformed and have been subjected to greenschist facies metamorphism. A gabbro has intruded part of the property and is parallel to the main lithologies. See Detail Map 2.

6.2.1 Chemical sediments

No AFIF was found in this area during mapping. The chemical sediments seen were cherty iron formations and magnetite-rich iron formation and were found mostly southwest of TL-089+00N on L-073+00E, L-070+50E, L-068+00N and L-065+50E. There is only one outcrop that is similar to the AFIF and it is located on L-065+50E. It has 50% magnetite in mm-scale bands, chert in cm-scale bands and 0.5mm wide amphibole bands. The amphibole is dark gray-green, fine-grained and was identified as actinolite in the field.

The BIFs are mostly magnetite-rich iron formations with over 60% magnetite. They have mm-scale bands of chert with magnetite bands usually never more than 5mm thick. Many of them also have a small number of biotite-rich bands probably from pelitic material. There are also a few outcrops of cherty iron formations with less than 10% magnetite. Grunerite can be found in a few of the BIFs. One sulphide facies iron formation outcrop was mapped along TL-089+00N just east of L-070+50E and another on TL-094+00N just in between L-070+50E and L-068+00E. The first is massive, green, locally magnetic (in bands) and rich in sulphides. The second is dark green, magnetic, banded, cross-cut by quartz veins and rich in sulphides.

6.2.2 Mafic volcanics, gabbros, amphibolites

The mafic volcanics are dark green fine-grained, composed of actinolite and plagioclase and, non-magnetic. To the southwest of TL-094+00N they are often banded with alternating mafic-rich and felsic-rich bands.

The gabbros are medium- to coarse-grained and composed of actinolite and plagioclase (about 50% of each). The actinolite has occasionally altered to chlorite. The coarser gabbros are amphibole-rich with relict cores of pyroxenes. Only a few of the gabbros are magnetic.

Amphibolite is only found on L-068+00E southwest of TL-089+00N. It is dark green, coarse-grained with actinolite crystals up to 1cm long, has no visible plagioclase and is non-magnetic.

The glomerophyric gabbro of central Trout Bay was mapped at only one location in this part of the property (on L-063+00E). The plagioclase is up to 1.5cm long and makes up a large portion of the outcrop. The outcrop is gray on the fresh and weathered surfaces.

6.2.3 Felsic volcanics

The most dominant rocks to the northeast of TL-094+00N are felsic volcanics. They are intercalated with minor thin mafic volcanics flows and in one place with intermediate volcanic flows. The felsic volcanics are homogeneous crystal tuffs composed mostly of plagioclase and up to 5% quartz eyes. They are fine-grained, have a well-defined fabric and the plagioclase is usually sericitized.

6.2.4 Intermediate volcanics

Mineralogically similar to the mafic volcanics, the intermediate volcanics to the southwest of TL-094+00N are often banded with alternating mafic-rich and felsic-rich bands. The banding usually makes it difficult to determine if the rock type is mafic or intermediate in composition. However, when compared to the banded mafic volcanics they appear more felsic and are usually medium green. Where the intermediate volcanics are not banded they are fine-grained, have a

well-defined fabric, are medium green and have a higher plagioclase content then the mafic volcanics.

6.2.5 Felsic to intermediate intrusives

On the baseline near MacIntosh Lake road the outcrops are all massive, homogeneous, coarse-grained quartz diorite. There are only a few outcrops of intrusives in the rest of the area and these are also quartz diorites with one tonalite.

6.2.6 Sediments

The sediments are usually siltstones or wackes that are fine-grained, unbedded, platy, dark gray to black in colour, biotite-rich with variable amounts of chlorite and no quartz. Some of the outcrops have small garnets and others have mm-scale clasts.

6.2.7 Mineralization

Mineralization in the area appears not to be well developed except at a few outcrops and trenches. In general, the mineralization is made up of fine-grained disseminated cp, py and po that accounts for no more than 1-2% of an outcrop's composition. Very little mineralization is found in the mafic volcanics and gabbros. Most of the mineralization is found in felsic volcanics except in a few locales like the sulphide-facies iron formation on TL-094+00N. The mineralization in the trench is found within quartz veins, cross-cutting the host, consisting of disseminated cp and py. There are numerous trenches northeast of TL-094+00N near L-065+50E but many of these trenches are hidden by fallen trees or very thick underbrush and filled in with debris. Two of the trenches were sampled and had disseminated cubic pyrite up to 0.5cm in size within felsic volcanic crystal tuff. One trench on L-055+00E had cp, py and sp disseminated and in small veinlets within felsic volcanic crystal tuff.

6.2.8 Structure

The main fabric in the region strikes between 320° and 340° and dips steeply to the northeast. The lithological contacts parallel this orientation. Foliation is well developed in the felsic volcanics northeast of TL-094+00N and in the banded mafic volcanics. The only bedding measurements were taken in the iron formations. One major fault was encountered that creates steep slopes or cliffs often over 10 m high. It is sub-parallel to L-073+00E and crosses it between TL-089+00N and TL-094+00N.

6.3 Geology of the Pipestone Bay property (Ball Township)

The Pipestone Bay property is mostly underwater so the shoreline was sampled as well as some in-land outcrops. Pipestone Bay is possibly underlain by a large ultramafic intrusion. Most of the area is magnetic and a large magnetic low is located at the center of the bay. See Detail Map 3.

6.3.1 Ultramafics

The ultramafic rocks on the shore are mostly serpentinites and peridotites. The rocks are massive and are usually rich in serpentine and/or talc. Most of the ultramafic rocks contain crystals of magnetite of varying sizes and amounts. Talcose portions contain no visible magnetite and are less magnetic than those that are serpentine-rich. Some non-magnetic outcrops had visible crystals of chromite or hematite. None of the outcrops had visible mineralization. One of the outcrops had potassium feldspar and epidote alteration with galena crystals. Another outcrop had what appeared to be fuchsite alteration.

6.3.2 Mafic volcanics

There are few mafic volcanic outcrops on this property. They are dark green, massive, fine-grained, non-magnetic, composed of actinolite and plagioclase and have no carbonate material. Some outcrops inland from the southeastern shore of Pipestone Bay in contrast are coarse-grained with actinolite crystals up to 5cm long.

6.3.3 Felsic volcanics

On the southeastern shore of Pipestone Bay some altered felsic volcanic crystal tuffs were encountered in contact with ultramafics. They are plagioclase-rich with 2-3% well-rounded quartz eyes about 2mm in diameter, are non-magnetic, massive, sericitized and possibly chloritic.

6.3.4 Mineralization

None of the samples collected on the Pipestone Bay property had any significant mineralization. There are a few mafic volcanic outcrops that have up to 1% disseminated py grains or cubic py, but otherwise the rocks are unmineralized.

6.4 Geology of the Middle Bay property (Ball Township)

The Middle Bay property is in an area that has intense carbonate alteration and many small shear zones. These small shear zones are well mineralized and often have high gold values. See Detail Map 3.

6.4.1 Mafic volcanics, ultramafics

The mafic volcanics are dark green, fine-grained, composed of actinolite and plagioclase, and in many cases, cross-cut by iron carbonate veins and quartz veins. Generally massive, the mafic volcanic outcrops located in or near the small shear zones have well developed fabrics and many more iron carbonate veins. Some of the outcrops are magnetic. Much of the mineralization in this area is found in the mafic volcanics.

The ultramafics have variable compositions. They are magnetic and usually show intense carbonate alteration. Some are serpentine- and/or talc-rich while others contain very fine-grained radiating acicular white tremolite with very fine-grained dark green actinolite.

6.4.2 Felsic volcanics

The felsic volcanic outcrops in this area are all very similar because they are plagioclase-rich and have approximately 2-5% rounded, slightly flattened quartz eyes that are up to 4mm in diameter. They are white to very light gray in colour, have well defined fabrics, and are unmineralized.

6.4.3 Mineralization and alteration

Sulphide mineralization in the area is generally confined to the mafic volcanics and ultramafics and occasionally found in the felsic volcanics. It comprises disseminated or blebby cp, py and po. A small deformation zone about 3m wide, off the northwestern tip of May-Spiers island, contains sulphide mineralization (~10%) as veinlets and disseminated in carbonates veins. This is a good example of the larger scale structures found in Middle Bay, at least two major east-west corridors that have allowed the passage of fluids through the area. Evidence of this is visible on shore where there is pervasive ankerite veining.

7. Sampling Method and Analysis

All the samples collected for this project were grab samples that were either sent for whole rock analysis (XRF) or 22 element (Au-ICP) assay. Whole rock samples were collected at every few outcrops on the grid lines of the Trout Bay property, as well as at every few outcrops during traverses or lakeshore mapping on the Middle Bay and Pipestone Bay properties. When samples were collected for whole rock analysis care was taken to insure that the samples had no or very little vein material and that they did not contain any visible sulphides.

Samples for assay were collected mainly where visible mineralization was found. However, on the Trout Bay property, samples of banded iron formation (the target), as well as any rock in contact with it (either directly or inferred), were also collected for assay. On the Pipestone Bay property samples were collected at almost every outcrop mapped even when no mineralization was seen. The Middle Bay samples give a good representation but are less

numerous because of the shorter time spent mapping this property. The only property with a poor representation of assay samples is in the south part of the Trout Bay property. This is due to the lack of mineralization, absence of the target in this area, and the pronounced effects of the Killala-Baird and Douglas Lake plutons on the supracrustals.

Samples that were collected for XRF analysis were sent to XRAL Laboratories in Toronto while samples collected for assay were sent to the ALS CHEMEX Laboratories in Thunder Bay.

For a list of samples sent for XRF analysis with sample locations and descriptions see Appendix 2. For a list of samples sent for assay see Appendix 3. The assay certificates from XRAL are found in Appendix 4 and those from CHEMEX are found in Appendix 5.

8. Interpretation of Results

The supracrustals of the southern portion of the Trout Bay property have been affected by the intrusion of the Douglas Lake Pluton, pronounced gneissic, and in some areas, migmatite development with potassic metasomatism. This intrusion has made lithological contacts difficult to follow, often completely destroying them. The rocks have been quite altered. The mafic volcanics that are in contact or in proximity with the pluton are a good example of this because they have been altered to metagabbro. There is also a large amount of potassium feldspar-epidote alteration. Due to the lack of mineralization, only one sample from this area was sent for assay. This sample did not have any significant gold, platinum or palladium corroborating assay data obtained from samples collected by D.R. Cutting in the same area during the fall of 2000 (see Cutting, 2001).

The northwestern portion of the Trout Bay property is made up of linear, parallel striking lithologies trending approximately 330°. A similar target to that identified in central Trout Bay (i.e. BIF in contact with mafic volcanics or gabbro) was located in the northwestern portion of the Trout bay property. BIF, in contact with mafic volcanic and/or gabbro, was mapped on most of the lines southwest of TL-089+00N. It appears to be up to 25m wide in places (apparent thickness). However, neither the BIF, nor the mafic volcanics or gabbros in contact with the BIF, returned any significant platinum or palladium values. The felsic volcanics north of TL-094+00N also did not have any significant gold, platinum or palladium. During mapping, one grab sample (632496), taken from a trench located on L-055+00E, assayed 3200ppb gold and 6160ppm zinc and another (632495) assayed 750ppb gold and 15100ppm zinc. These were the only significant assay results obtained from grab samples collected on the Trout Bay property during the summer 2001 mapping program. The mineralization in this sample consisted of disseminated py, cp and sp that was also found in fractures within felsic volcanic tuff. Though drilling was not part of this project, Noramco and Golden Day Mining drilled this part of the property in 1989 (see section 4.3). A diamond drill hole (NDC87-5), that is presumed to have been drilled close to the sample location, was relogged and sampled by T. Hughes. The results of this relogging can be found in

Appendix 6 at the end of the report. The hole is composed of dacite tuff and lapilli tuff cross-cut in one location by gabbro. There is only one interval in the hole (57.8-59.2m) that has significant mineralization (<1% undeformed late py, cp, and sp). This mineralization corresponds with that of the grab samples. However, no values like those obtained from the grab sample were returned.

The Pipestone Bay property was sampled for both XRF and assay to determine fractionation, relevant sulphide saturation and PGE potential. The majority of the rock types sampled were serpentinites thought to be peridotites originally. Assay results did not show any significant platinum or palladium values.

The Middle Bay property had the greatest number of samples with elevated gold values. None of the samples however, had elevated PGE values. Four samples on this property had over 1000ppb gold that ranged between 1800ppb and 9100ppb gold. These were mostly obtained from old trenches located on the property. These samples were collected along what appears to be a corridor containing iron-carbonate veins, quartz veins and, disseminated and blebby sulphides (usually py, some cp). This corridor is possibly a shear zone or multiple small shear zones. The property surrounding Bridget Lake is known to have high gold values but samples collected on our property to the east and west of the Bridget Lake property did not return any significant gold values.

9. Conclusions

The detailed mapping in the south part of the Trout Bay property shows that the AFIF does not extend into this part of the Trout Bay property and that the glomerophyric gabbro is discontinuous and cannot be used as a marker horizon. This part of the property is essentially unmineralized and no sample had any significant gold, platinum or palladium values.

The AFIF was not located in the northwest part of the Trout Bay property. However, a BIF was mapped and could be an extension of the AFIF found in central Trout Bay. This BIF does not have any significant mineralization. The glomerophyric gabbro was only found in one location. No samples from this part of the Trout Bay property had any significant assay values except two samples taken in trenches on L-055+00E. One sample had 3200ppb gold and 6160ppm zinc while the other had 750ppb gold and 15100ppm zinc. Both were found in a felsic volcanic tuff.

The Pipestone Bay property appears to be one large ultramafic intrusion that has the potential of hosting PGEs. No significant PGE values were returned however, from the samples collected this summer.

From the reconnaissance sampling in Middle Bay this summer, this property has the best gold potential. It is known to have intense carbonate alteration and many small shear zones. Furthermore, four samples collected had between 1800ppb and 9100ppb gold.

10. Recommendations

Additional mapping and sampling is suggested for the northwestern part of the Trout Bay property to better define the geology surrounding the trenches on L-055+00E where two grab samples returned high gold and zinc values. Mucking out the trenches would help in understanding the style of mineralization. This area was clear-cut in the fall of 2001 probably providing good outcrop exposure and relatively easy access to new outcrops. Furthermore, additional mapping and sampling could be carried out southwest of TL-089+00N to better define the target (AFIF) and to determine with more accuracy if it is the extension of the target in central Trout Bay.

A more detailed look at the geochemistry of the ultramafics of the Pipestone Bay property is suggested and would lead to a better understanding of the area and its mineral potential. Once there is a better understanding of the area's geochemistry drilling is suggested to determine the mineral potential at depth and the geology of the rocks under the bay.

More detailed work is recommended for the Middle Bay property in the form of additional sampling and detailed mapping with the use of a network of cut grid lines. The grid lines should be concentrated in the area surrounding Middle Bay, especially the southern shore to get a better sense of the area's structure.

12. Statement of Qualifications

I, Léa-Marie Bowes-Lyon, declare that:

I reside at: 1474 Lloyd George
Verdun, PQ
H4H 2P5

I graduated from McGill University (B.Sc. Hons. Geology) in June 2001 and have been continuously employed in the mineral exploration industry since.

I do not hold, nor have previously held any direct or indirect interest in Goldcorp Inc. property including those worked on in this report.

Léa-Marie Bowes-Lyon

Sample Number	S (%)	As (ppm)	Se (ppm)	Description
632559	<0.01	0.3	0.2	Massive, act-plag mineralised. QV x-cutting. Dk grey, f-g. Non-magnetic, NVS
632560	0.07	0.1	0.4	Amphib-plag, non-magnetic NVS, wkly chloritic? Nil carbonate, quite massive, dk grey.
632561	0.07	2.3	0.2	Gabbro intruded by diorite. 60:40 amphib-plag. Possibly pseudomorphing after px. Dk grey-green. Diorite contains xenoliths of same.
632562	0.03	1.6	<0.1	Non-magnetic, nil carbonate, Locally, c-g, almost pegmatoidal. 50:50 amphib-plag. Massive, x-cut by 10 cm wide QV.
632563	<0.01	0.4	0.2	Dk green, amphib-plag mineralised, massive, with biotitisation. X-cut by QV-carbonate veining.
632564	0.04	0.2	0.5	F-g, sericitised, pale grey, w bte bands.
632565	0.06	0.3	0.2	F-g, dk grey-green. Non-magnetic, NVS, no carbonate, massive. Mr QV x-cutting.
632566	<0.01	0.3	0.1	C-g amphibolite, poss actinolite. To 1.5 cm diam. Nil carbonate, non-magnetic, massive, NVS. No plag observed. Wkly chloritic (can scratch).
632567	<0.01	0.9	<0.1	C-g amphibole, to 2 cm. Non-magnetic, massive, nl carbonate. Biotitised, with plag forming scattered 'clots' to 2 mm diameter.
632568	0.06	0.8	0.3	Dk grey, f-g, possibly amygdaloidal (filled with qz, bte & plag) (so not amygdules). Non-magnetic, massive, nil carbonate. Essentially fel-amphibolitic.
632569	<0.01	0.6	0.1	M-g, fel-amphibole, dk grey. Amph to 2mm, plag, same. Massive, non-magnetic. X-cut by (??) feldspar veins with subsequent chloritisation. Metagabbro is amphibolitised. Possible late diopside noted,
632570	0.07	0.8	0.1	Banded, mm scale (plag-amphib differentiated). Veins of brownish ?muscovite. Locally diopside-plag alteration. (?Vein-type0 Non-magnetic, no carbonates. Gt present with muscovite.
632571	<0.01	0.9	<0.1	"Leucogabbro" 40:60 amphib:plag (so not leuco). 1mm-1 cm diam xls. Massive, no carbonate, non-magnetic, NVS. Qz noted. Some differentiation of lithotype noted, between leucogabbro & gabbro. Metagabbro.
632572	0.09	0.9	<0.1	"Leucogabbro" 40:60 amphib:plag. Magnetic, no carbonate, NVS. Hornblendic. Glomerophyric (?what) Weakly foliated. Bte veining noted.
632573	<0.01	0.2	<0.1	C-g gabbro. 50% amphibole (biotitised). Massive, non-magnetic, x-cut by qz-fel veins. Epidotised. Some diorite veins brecciating gabbro, with rexln.
632574	<0.01	0.2	<0.1	C-g amphibolite (act or tremolite) to 1.5 cm long. Massive, non-magnetic, NVS. X-cut by 1mm wide QV.
632575	0.12	0.4	<0.1	Field notes include "Leucodiorite", "Maf. Volc Sed?". Dk green, with clasts of feldspar. Sub-angular, containing amphibole. Other clasts are biotitic. Massive(?) non-magnetic, no carbonate, NVS.
632576	<0.01	0.8	<0.1	Lg plag xls to 3x2 cm, with zonation (greenish or pink cores) Massive, non-magnetic. ?Float
632577	<0.01	0.6	<0.1	Grey, f-g. No carbonate, non-magnetic, NVS.
632578	<0.01	0.6	<0.1	F-g, massive, non-magnetic, carbonate veined to < 1mm wide.
632579	<0.01	0.3	<0.1	315/80 Foliated. F-g, feldspathic, x-cut by carbonate veining. Possible amphibole veining parallel to main fabric. Non-magnetic. NVS. Finely clastic?
632580	<0.01	0.3	<0.1	F-g, grey, locally magnetic. Massive, NVS. Chloritic?
632581	0.04	<0.1	<0.1	Grey metagabbro (act-plag) Non-magnetic, no carbonate. Plagioicase veined. At contact between gabbro & veins, coarse actinolite mineralisation noted.
632582	0.04	<0.1	0.4	Grey, no carbonate, wkly magnetic (localised). Quite mafic. Plagioclase veined. Trace py. Numeous QV. 3:1 flattening of plag. 330/68
632583	0.05	0.5	0.2	Wkly magnetic & localised. ?Same sample as 632582
632584	<0.01	<0.1	<0.1	Bte veined. Dk grey-green, NVS. Non-magnetic, no carbonate. Serpentinisation along/in veins with gt "or iron staining" Wkly tourmaliniferous? Quite massive.
632585	0.15	0.3	0.6	Plag-qz miineralised, w xls <1 mm diam. V wkly magnetic. NVS. Fine fabric noted or banding, with possible graded bedding.
632586	<0.01	0.8	0.3	Dk grey, non-magnetic, massive, with wk carbonate. Act-plag mineralised.
632587	<0.01	0.2	0.2	Spares blebby py. Dk grey-green, f-g. Close to mafic volcanic o/c (5 m away)
632588	0.05	0.2	<0.1	50:50 amphib-plag. X-cut by fel veining to 3mm. Locally, wkly magneticAcicular act to 3 mm (av). Chle &or bte mineralised on S-planes.
632589	0.07	<0.1	<0.1	Actinolitic, massive, no carbonate, NVS, bluish-dk grey on weathered surface. Quite mafic.
632590	<0.01	0.2	<0.1	300/75 fabric. Locally micaceous with irr fel veining. Grey-green. Relatively homogeneous save for crude banding. Non-magnetic
632591	<0.01	0.4	0.3	Mr plag veining. Amphib(act)-plag mineralised. Non-magnetic, no carbonate. Main fabric at 326/87
632593	<0.01	3.5	<0.1	Non-magnetic, f-g, green-grey. NVS. X-cut by fel veining. Quite massive
632595	<0.01	<0.1	0.2	Dk grey, non-magnetic, no carbonate. Sparse plag. Quite soft so chloritic?
632598	0.14	<0.1	0.3	Act-plag, no carbonate, NVS. Banded, dk grey, f-m-g.
632600	0.08	0.3	0.4	Gneissic banded, w <20% mafics. 125/30 fabric (late plunge) Late qz-cte-chl veining. Main fabric at 330/75
632404	<0.01	<0.1	<0.1	Coarse-grained amphibolite w/ a dk gn fresh and weathered surface, massive, non magnetic, no carbonate, no mineralization, <1% plag, actinolite crystals up to 1cm long, cross-cut by a vein of feldspar and quartz.
632405	<0.01	0.2	0.2	Medium-grained gabbro to melano-gabbro w/ dk gn fresh surface and gn weathered surface, 40% plag, 60% actinolite, no carb, non magnetic, no mineralization, massive, homogeneous.
632406	<0.01	0.2	0.2	Coarse-grained melano-gabbro to amphibolite w/ gn weathered suface and dk grey fresh surface, non magnetic, no carbonates, no mineralization, amph (trem or act) crystals up to 1cm long, <25% plag, 75% amph, massive.
632407	<0.01	<0.1	0.2	Medium-grained gabbro that is dk/ gy-gn on weathered surface and dk gy on fresh sruface, 50% plag and 50% actinolite, massive, non magnetic, no carbonates, no mineralization.
632410	<0.01	<0.1	0.2	Fine-grained mafic volcanic, md gn on weathered surface, dk gn on fresh surface, banded with alternating lighter and darker bands, qz-fs veins pll banding, carb veins cross-cut banding, banding oriented at 340/77.
632411	0.08	0.4	0.2	Fine-grained intermediate volcanic, no qz, non magnetic, no carbonates, no mineralization, alternating mafic and felsic bands.
632412	<0.01	0.2	0.4	Fine-grained mafic volcanic that is brown-gn on weathered surface and dk gn on fresh surface, mostly act+plag, bt-rich, non magnetic, no carbonate, no mineralization.
632414	<0.01	1.7	0.4	Fine to medium-grained gabbro, dk gy fresh surface and gn-white weathered surface, massive, non magnetic, no carbonate, 55% act, 45% plag, cross-cut by qz+fs veins up to 2cm wide.
632415	0.03	0.1	<0.1	Fine to locally medium-grained banded, platy and well foliated mafic volcanic, dk gy-gn fresh surface, dk gn weathered surface, variable amounts of act and plag, non magnetic, no mineralization, no carbonates, foliation 330/80 (measured off of line).

Sample Number	S (%)	As (ppm)	Se (ppm)	Description
632416	<0.01	0.1	<0.1	Felsic volcanic crystal tuff, lt gy to beige weathered surface, lt to md gy fresh surface, rounded qz eyes 0.5-1mm in size, rounded plag up to 1mm, no mafic minerals, no mineralization.
632418	<0.01	0.3	<0.1	Fine to medium grained mafic volcanic, act+plag, non magnetic, no carbonate, no mineralization, well foliated, cross-cut by qz+fs veins.
632419	<0.01	0.2	<0.1	Felsic volcanic crystal tuff, brown weathered surface, gy fresh surface, <2% qz eyes, no mineralization, non magnetic, no carbonate, similar to other fvct seen in the area.
632420	<0.01	0.2	<0.1	Medium grained felsic volcanic crystal tuff, plag+qz, 10% ~1mm qz eyes, no mineralization, no carb, non magnetic, S2=315/76, kink bands (sinistral)=280/65, crenulation on foliation plane=315@40, large qz veins, rock has greenish appearance due to chl?
632424	0.05	0.5	0.4	Fine-grained intermediate volcanic, dk gy weathered surface, gy fresh surface, 75% act, 25% plag, non magnetic, no carbonates, no mineralization, plag "banding"=330/78.
632425	0.22	0.5	0.6	Medium-grained felsic volcanic xtl tuff, no qtz eyes, mostly plag, non magnetic, disseminated py, some mafic minerals locally creating sm bands up to 1cm wide, lt gy fresh surface.
632426	0.11	0.1	0.6	Fine-grained mafic volcanic w/ minor amounts of po locally, dk gy weathered and fresh surface, minor carb, very crumbly and weakly foliated, cross-cut by qtz veins.
632430	<0.01	0.4	0.5	Fine-grained intermediate volcanic (dk gn fresh surface) w/ amph, plag and bt, non magnetic, no carb, no mineralization, massive, cross-cut by qz veins.
632431	0.07	0.3	0.7	Fine-grained mafic volcanic that is med gn on weathered surface and gy on fresh surface, massive, mostly act with plag, cross-cut by qz veins, more felsic bands locally, no carb, no magnetic, no mineralization.
632433	<0.01	0.3	0.3	Medium to coarse grained gabbro, dk gy fresh surface, dk gy weathered surface, 50% plag, 50% act, non magnetic, no mineralization, minor carb as veins.
632434	<0.01	0.5	0.2	Coarse grained gabbro (act up to 0.5mm long), non magnetic, no mineralization, no carb, cross-cut by qz and qz+fs veins, 60% act, 40% plag (fine-grained), massive.
632436	<0.01	0.2	0.2	Possible boulder of very fine-grained felsic volcanic, probably a welded tuff, fabric=290/87, lt cream gy on weathered surface, lt gy on fresh, some <0.5mm qz eyes, no xtls, non mag, no carb, no min, x-cut by qz veins, brown/orange rust spots from bt?
632437	<0.01	0.1	0.2	Fine-grained mafic volcanic, no mineralization, no carb, non magnetic, med gn on weathered surface, gy-gn on fresh surface, some spots have more plag.
632440	0.05	0.3	<0.1	Medium-grained mafic volcanic at cntct with a felsic volcanic xtl tuff, lcl weakly magnetic (due to po? b/c some rusty wthrng), amph up to 2mm long and 0.5mm wide, plag, bt, no carb, well foliated=345/88, dk gn f srfc, med gn w srfc, cntct pll to fabric.
632441	<0.01	0.5	<0.1	Mgr mafic volcanic, md gn wthrd srfc, dk gy-gn f srfc, amph-rich (act) 2mm long 0.5mm wide and bladed, plag not very visible, non magnetic, no carb, no mineralization, fabric=350/70.
632444	<0.01	<0.1	0.2	Fgr to mgr mafic volcanic w/ a md to lt gn w srfc, fabric=325/85, soft, act+mica+chl &/or serp?, x-cut lcl by qz+fs veins, no mineralization, non magnetic, no carb, mica layers appear crenulated.
632446	<0.01	0.1	<0.1	Cgr meta-gabbro, dk gy-gn f srfc, dk gn w srfc, no carb, non magnetic, no mineralization, act xtls up to 5mm long, not much plag (difficult to see), fabric=144/85 (varying dip).
632448	<0.01	0.1	<0.1	Fgr to mgr mafic volcanic, non magnetic, no mineralization, no carb, x-cut by 1-2mm wide qz+fs veins, fabric=335/74.
632449	<0.01	0.1	0.1	Banded intermediate volcanic, non magnetic, no carb, no mineralization, dk gy f srfc, buff gy w srfc, act+plag, heterogeneous, alternating mafic-rich and felsic-rich bands.
632450	<0.01	<0.1	<0.1	Banded fgr mafic volcanic, dk gy-gn on w srfc, dk gy on f srfc, non magnetic, no carb, no mineralization, banding=330/84, x-cut by qz+fs veins.
632451	<0.01	<0.1	<0.1	Fgr mafic volcanic, dk gn w srfc, dk gy f srfc, no carb, non magnetic, no mineralization, x-cut by ~1m wide qz+fs vein.
632452	<0.01	0.1	<0.1	Fgr intermediate volcanic, lt gy w srfc, dk gy f srfc, non magnetic, no mineralization, rich in carbonate (disseminated and in 1mm veins), plag+act, some coarse cc+ep?
632453	<0.01	0.3	<0.1	Gabbro with cgr (up to 1.5 cm long) plag xtls and fgr act xtls, dk gy f srfc, lt gy w srfc, no mineralization, no carb, non magnetic, looks glomerophyric but not exactly.
632454	<0.01	<0.1	0.1	Banded Int.-Mafic Volcanic? F-g, act-plag mineralised. Green-gre/pale grey banded. Unmineralised
632455	0.05	0.2	0.3	Glomerophyric gabbro, w. c-g plagioclase to 1/1.5 cm diam. Matrix is actinolite-plag, with latter predominant.
632478	0.08	2.6	<0.1	Altered mafic volcanic with pervasive carbonate & sparse, fine diss ?py. Med grained, bluish grey on fresh surface.
632480	0.08	0.5	<0.1	M-g felsic volcanic xl tuff. Feldspathic, with 15 qz eyes. No carbonate no visible 'mafic minerals'. Sulphides not observed.
632482	<0.01	0.2	<0.1	M-g, med green, weathered surface, & grey on fresh. Soft, probably chloritic, poss serpentine & 'some micaceous mineral'. Non-magnetic, nil carbonate, no sulphides. Previously mapped as gabbro.
632483	<0.01	0.1	<0.1	M-g feldspar-actinolitic, non-magnetic, nil carbonate, grey-green. Mr cte veining.
632484	0.07	0.7	<0.1	Felsic volcanic xl tuff. No qz eyes, non-magnetic, nil carbonate, with to 2 mm wide QV. Well defined S2. Locally, weakly magnetic.
632485	0.05	1	0.3	Feldspar-actinolitic, (40:60). M-g. No sulphides noted. Mr carbonate. X-cutting QV to 10 cm wide.
632486	0.01	0.5	0.2	Feldspar-actinolitic, with latter to 3 mm long. Sample contains micas &/or chl. Looks like a f-g gabbro. Strike: 342/62 (S2)
632487	<0.01	0.2	<0.1	Tuffaceous, with well-developed fabric. Med grey, with acicular amphibole in near-rosette form/radiating. No lithic fragments, no carbonate, no sulphides with mr x-cutting QV.
632488	<0.01	0.2	0.1	Grey-green, no sulphides, no carbonate save for Qz-cte veining. Plag-actinolitic (20:80) (?)
632489	<0.01	<0.1	0.1	Dk green, non-magnetic, no sulphides, sparse veining. No carbonate. Actinolite-feldspathic. Appears banded.
632490	0.03	<0.1	0.1	Appears like a f-g gabbro, with well defined xls on weathered surface. Massive, no carbonate, no sulphides. Actinolite to 2 mm Overall, 60:40 act;plag. Mt QV to 10cm.
632491	0.04	0.3	0.2	?Mafic volcanic. Dk green, actinolite-bte>>plag. Well defined S2. Non-magnetic, no carbonate.
632492	<0.01	0.3	0.1	Xl tuff. Non-magnetic, no carbonate. Sparse diss py to <0.5 mm diam. Med grey-green fresh, buff white-orange on weathered.... Well developed S2.
632493	<0.01	0.3	0.1	Dk green, no sulphides, no carbonate, non-magnetic, weakly lineated, fine grained.
632494	<0.01	0.6	0.3	Contact between preceding & a felsic xl tuff (following sample)
632498	<0.01	0.5	0.3	M-g, dk grey, mr cte veining. Non-magnetic, nil sulphides. Act-plag mineralised, with variable composition. Generally massive. Metagabbroic.
632502	<0.01	2	0.3	Med grey, weathered, dk grey, fresh. Non-magnetic, nil sulphides, with sparse, localised carbonate. Matrix not determined, or textures.
632503	<0.01	0.2	0.2	?Actinolitic, m-g. Dk green. O/c also exposes chert-magnetite IF. No sulphides.
632504	<0.01	1.2	0.3	Actinolite-feldspathic, with abundant carbonate (unclassified). Non-magnetic. Mr diss py.
632505	<0.01	3.6	0.2	Galena ls. M-g gabbro. Grey Act-plagioclse mineralised, massive, magnetic, with localised, pervasive calcite alteration. X-cut by ?calc-silicates in cte-qv.
632506	<0.01	0.6	<0.1	Act-plag mineralised with indeterminate %ages. X-cut by numerous Fe-carbonate veins. Dk grey. Non-magnetic, nil sulphides.

Sample Number	S (%)	As (ppm)	Se (ppm)	Description
632507	0.01	0.3	<0.1	Pale weathered surface, to lt grey fresh. Non-magnetic. Matrix is v f-g. with greenish tint. Feldspathic with sparse qz eyes.
632509	<0.01	2	0.2	Actinolitic, nil sulphides. Weathers lt buff orange to lt buff green. Bluish green fresh. F-m-g. Magnetic. Veins of ??wollastonite + talc noted. (Probably tremolite & serpentine).
632510	<0.01	0.9	0.1	Grey-green, non-magnetic, f-m g, massive. No visible feldspar, being quite dark. Localised, semi-pervasive carbonate. ?Actinolitic. Cut by <1mm f-g dk green mineralisation (hbl or cpx?)
632511	<0.01	21.7	<0.1	Acicular to 3mm long, actinolite. Relatively weakly feldspathic, with semi-pervasive carbonate (cte). Homogeneous, massive. Non-magnetic, nil sulphides. Possible epidotised.
632512	<0.01	0.4	0.1	Bluish-green, weathered, dk grey-green, fresh. M-g, gabbroic, actinolitic, non-magnetic, with no visible sulphides. Weak, pervasive carbonatisation. Galena ls.
632513	<0.01	0.2	<0.1	Brownish lt green, weathered, dk green, fresh, nil carbonate, sulphides, magnetite. ?'Wollastonite' again noted, being prismatic, elongate, scratchable, so carbonate or tremolite.
632514	<0.01	<0.1	<0.1	10-50 cm wide, minor elongation, with 1-2 cm wide selvedges. Variolitic to 2 mm diam. Pillows X-cut by qz-cte veining. Weakly magnetic.
632516	<0.01	0.3	0.2	Possibly welded. Lt grey fresh surface. Non-magnetic, mr cte veining, no visible sulphides. Feldspar-qz'ose. Well defined fabric - 095/87
632517	<0.01	33	0.2	50:50 act-plag. Non-magnetic, no visible sulphides, relatively soft (?chl). Nil carbonate. Quite massive.
632518	0.06	2.4	0.2	Weakly magnetic, with weak, pervasive carbonatisation, x-cut by Fe-carbonate veining &/or QV. Qz to 30x50cm (pod). Extensional Fe veining. Freah surface dk grey, weathered dk grey-green. Appears to be no plagioclase. Possible melanogabbro/amphibolite.
632519	0.05	6.8	<0.1	Talcose, with 50% lt mineral (plag), & 50% ?act. Fresh - lt grey-green. Fe-carbonate veining as previous., randomly oriented, with QV from mm-5 cm wide, rarely 20cm. Soft. Probably serpentinised, rather than talcose. Weakly magnetic.
632520	0.15	1	<0.1	Well-defined fabric, 303/75. Qz eyes, (2-5%). Matrix is pla rich. Non-magnetic. Nil carbonate in matrix, no visible sulphides.
632521	<0.01	1.2	<0.1	Fine interstitial mafics or opaques. Plag-rich, no qz eyes, non-magnetic, no visible sulphides. May be chloritic, quite soft (style/nature not noted).
632522	0.01	0.3	0.2	Sparse qz eyes, plag-rich, non-magnetic. Similar to preceding. Non-magnetic.
632523	<0.01	0.5	<0.1	2% bte, non-magnetic, buff-white brown weathered. No qz eyes. Feldspathic (<2 mm diam.) Mr carbonate veining.
632524	0.09	0.4	0.5	Thin layer in int-felsic xl tuff o/c. (1m thick). Well-defined fabric. Mr QV. Laterally discontinuous.
632525	<0.01	0.3	0.4	25% qz eyes in plag-rich matrix. Mr tight-wavy folding. (No other information.) No carbonate, non-magnetic, no visible sulphides. X-cut by multiple QV to 20 cm wide. Old samples 676659,60 taken in QV.
632526	0.02	0.4	0.5	Atinolitic, massive. Previously sampled - flag w 27164. Mr plagioclase.
632527	<0.01	0.3	<0.1	Lineated actinolitic. "Looks like a mafic tuff".
632528	0.08	52.5	0.3	Magnetic, nil carbonate. Act-plagiolcase mineralised. Phenocrysts to 5% of rock(?) & to 0.5x0.5cm.
632531	<0.01	0.3	0.1	50:50 act-plag. Non-magnetic, nil carbonate, no visible sulphides. Act xls to 0.5mm wide. Massive.
632533	<0.01	3.1	<0.1	Serpentinitic, lt buff weathered, composed of "serpentine, magnetite, talc, chlorite) No visible sulphides. Carbonatised, massive.
632535	0.02	1.3	0.3	At contact between mafic volcanic & int. xl tuff. Qz eyes. Plag-qz'ose.
632536	<0.01	1.7	0.2	Just E. of shaft with x-cutting qz-carbonate veins. Qz eyes to 3 mm, slightly flattened, plagioclase-rich.
632542	<0.01	<0.1	20.8	?Anorthositic adcumulate. Previously mapped as all islands as serpentinite. Plag to 2 mm. <8% discernible mafics & mainly rounded blastic blebby mag. Very poorly carbonatised, massive. Sparse scattered garnets. Lt grey-green surface. NVS.
632543	<0.01	<0.1	58.8	Similar to preceding (632542). Soft. Cooling fractures noted. Magnetite throughout (diss & <1mm wide veinlets).. 5% mafics, massive. Locally, recrystallised, coarser plag. Late high Ca-fluid metasomatism causing serpentine-talc altn. Haematite veined.
632544	<0.01	<0.1	12.7	Closest sample to large mag low in Bay. (NE pt of island).
632545	<0.01	<0.1	1.1	In contact w. 'anorthosite'. Moderately-strongly epidotised. Magnetic. Previously sampled by?. Serpentinised.
656402	<0.01	<0.1	11	Magnetic, massive, dk grey-green, NVS. Negligible carbonate. Blue -grey weathered surface.
656403	<0.01	<0.1	0.7	In a thin deformation zone, 20 m wide. Carbonate-antigorite altered, with relatively unaltered u/m to the S. Dextral 'shearing'. Extensional carbonate veining. Lineated to finely banded. Dacite in H/W. (to the NW).
656404	<0.01	<0.1	0.6	Non-magnetic. (Poss MV not u/m?) Dis to blebby, to 2% py>>po. Dk grey, no serpentine. Dacite to the east. Appears relatively silicic.
656406	0.03	0.1	0.7	Far E. tip of ls., just by the claim post cache & survey pin. Peridotitic, magnetic, finely banded, NVS, dk grey-green. Fe-carbonate veining parallel to main fabric.
656407	0.13	0.6	2.5	Contact between sediment & tuff? Former is f-g alt'd argillite, dk grey, non-magnetic, NVS, biotitic, nil carbonate. Volcanic is pale grey on weathered surface, qith sparse qz eyes. Feldspathic. Sparse x-cutting QV.
656408	0.02	0.2	6.5	Lt brown-green, weathered surface. Nil carbonate, non-magnetic, w diss py. Biotitic & amphibole mineralised. Crudely layered.
656409	<0.01	<0.1	0.6	Soft, magnetic, with mt veinlets. X-cut by multiple carbonate veins (Fe & Ca). Serpentinitic. Massive, NVS.
656410	<0.01	<0.1	1	Soft, serpentinitic, NVS, Mg-carbonate veined (?) with mt xls. Brown to off-white on weathered surface. Massive, with randomly oriented carbonate veining.
656411	<0.01	<0.1	0.6	Similar to 656410.
656412	<0.01	<0.1	0.9	Similar to 656410. X-cut by (?)Mg-carbonate veining. Massive, with a few mt veinlets. Mt xls noted, (<0.5mm wide).
656413	0.29	0.3	53.1	Qz eyes to 3 mm & 2% by vol. Fuchsite-rich "horizons. Non-magnetic. <1% veinlet or diss carbonate.
656414	0.01	<0.1	0.2	Nil carbonate, mt, sulphides. Mr fuchsite.
656415	<0.01	0.1	7.1	F-g, no qz eyes. Lg "clasts" of dolomite in tuff (10x15cm). Feldspathic, non-magnetic. Elongate 'careous' weathering.
656416	<0.01	0.1	5.4	Numeous carbonate veins. Acicular tremolite noted, & radiating or as bundles/sheaves. Serpentinitic. Trace veinlet sulphides (py>>). Mr lg carbonate veining.
656417	<0.01	0.2	8.4	Carbonatised, tremolitic, serpentine-talc mineralised. Quite massive. Locally indeterminate strong deformation (?) Possibly a pxenite (?)
656418	<0.01	<0.1	0.3	On lg o/c. Similar to 656417, but considered a mafic volcanic(?) Finer tremolite xls. Carbonate veined, quite massive, NVS. Can be scratched with knife. "pyroxenite?"
656419	<0.01	<0.1	80	Feldspathic, w qz eyes. Sparse fuchsite, & weakly, sporadically carbonatised.
656423	<0.01	<0.1	<0.1	320/40 (?) fabric. Feldspathic, <1% qz eyes. Nil carbonate, sulphides, non-magnetic.

Sample Number	S (%)	As (ppm)	Se (ppm)	Description
656424	0.02	0.2	8.5	Rare qz eyes. Feldspathic, with scattered fine bte.
656427	0.03	0.1	6.2	?Mafic-Int. 309/76 fabric. X-cut by to 1.5 cm wide QV (randomly oriented). Mostly tremolitic (?Int. volcanic) F-g.
656428	<0.01	0.1	0.8	Schistose, 1% qz eyes, feldspathic, f-g. 1mm wide boudinaged QV. Crenulated, also. NVS, nil carbonate. M-g.
656429	0.04	<0.1	2.5	294/83 fabric. Homogeneous, lt grey, feldspthic, 15 qz eyes, negligible veining, non-magnetic. V small carbonate (?) xls/stringers.
656430	<0.01	0.1	10	Pale grey weathered surface. Serpentine-magnetite mineralised. NVS.
656437	<0.01	0.1	0.3	NVS, gy fr srfc
632551	<0.01	4.1	<0.1	Float, on drill rd behind TB 200-003, 50m W. Massive, weakly serpentinitic. No sulphides
632552	0.02	0.6	0.4	Alt'd pyroxenite that becomes more mafic towards end of line, cgr, black amph, blebby, interstitial plag, 85% mafic, massive.
632553	<0.01	13.1	<0.1	Heterogeneous oc of hbl drte cntng maf xenos and progressing to maf vloc at NE end of oc with intruding veins of diorite.
632554	0.06	0.3	0.3	Dk grey, x-cut by 1 mm wide qv. Wkly epidotic. <1% py. Non-mag.
632555	<0.01	0.3	0.2	Fgr dk gy maf volc x-cut by <1mm wide qz veins, non mag, no min, <1% <0.1mm py grains.
632556	<0.01	0.8	<0.1	Rusty dk gn weat'd srfc, dk gy gn fr srfc, fgr, amph, plag, non mag, no min, carc lcl as veins, weak foliation that couldn't be measured, several rusty brown spots of unknown mineral.
632557	<0.01	0.7	0.2	Massive mgr dk gy/gn, x-cut by <1mm wide carb veins, amph, plag, some po smears found lcl, amph is cgr near carb veins.
632558	0.04	0.5	0.1	Fgr dk gn amph & plag, massive, x-cut by qz-carb veins, more qz than carb, non mag, no min.
370622	<0.01	1.6	0.3	White weat's srfc, amph xtls up to 2cm long, on weat'd srfc plag xtls btw blades of amph making it look like olivine spinifex, no sulphides, non magnetic.

Sample #	Zn (ppm)	Description
632592	60	M-c-g melanogabbro, w actinolite. Sparse plag noted. Non-magnetic, NVS. Massive.
632594	60	Non-magnetic, c-g, act-plag mineralised, NVS. Wkly chloritic?
632596	120	4mm mt banding, mm scale pelite. Mt may contain bte. No sulphides noted
632597	160	Chert-mt banded, 1-3 mm wide, w mt to 3 mm. 60% mt. Bte mineralised. No sulphides mentioned.
632599	20	Rusty weathered surface. No carbonate, quite massive. Sparse QV. In poss Z-fold. Sulphide facies but sulphids not documented.
632401	100	Chert-rich, <5% magnetite content, bedding on mm-scale, grunerite, sharp contact between mafic volcanic and BIF (striking @ 330) subparallel to the bedding in the BIF and to S2 in mafic volcanic, S2=330/85, S3=085/88, mafic volcanic non magnetic.
632402	140	Coarse-grained non-magnetic gabbro that appears melanocratic and is composed mainly of actinolite, 345/75 lineation related to late feldspar veining.
632408	140	BIF (magnetite (85%) and grunerite), mm-scale bedding, few ct beds, no sulphides, bedding=345/85.
632409	120	Medium-grained gabbro (60% amph, 40% plag) that is dk gn on weathered surface and dk gy on fresh surface, non magnetic, massive, no mineralization, no carbonates, actinolite crystals are up to 3mm in size.
632413	240	BIF, cm-scale ct bands, mm-scale oxidized magnetite bands, 10% magnetite, possible sulphides.
632421	360	Sulphide facies iron-formation w/ disseminated py+cp, magnetic, no carbonates, some qz veins pll to the banding, host rock is dk gn.
632422	20	Argillite w/ dk gy fresh surface, non magnetic, contains disseminated py and cp, bt defines foliation plane and is where mineralization is found, sm amount of carb veins, some qz.
632423	80	Argillite, no visible mineralization but has the right rusty weathering colour, non magnetic, no carbonate, well foliated, green colour locally (malachite?) from sulphide weathering.
632427	60	BIF with no grunerite, no sulphides, no carb, ~5m thick on surface, >70% magnetite.
632428	60	BIF w/ ct beds ~1cm wide, magnetite layers are mm-scale, amph beds are 0.5mm wide, amph is dk gn and probably actinolit, no visible sulphides (but possible b/c of rusty weathering), 50% magnetite layers, no carbonates,
632429	80	Very fine-grained mafic volcanic with dk gn fresh surface and gn weathered surface and containing some act, bt and chl?, massive, very minor finfe-grained cp, no carb, non magnetic,
632438	40	Medium-grained intermediate volcanic, non magnetic, no carb, py locally, act+plag+bt, bt parallel to fabric, locally folded, cross-cut by qz veins on mm-scale, plag-rich, dk gy fresh surface, gy on weathered surface.
632445	140	Fgr to mgr mafic volcanic xenolith within a felsic intrusion about 1x0.5m in size, bt+plag-rich and has a few qz grains, lcl magnetic, some sulphides (py, cp), no carb, gneissic looking, x-cut by some qz-plag veins.
632447	60	Mgr mafic volcanic, 90% act, 10% plag, dk gn w srfc, dk gy-gn f srfc, disseminated po and poss some py, act 2mm long.
632456	<20	End of trench #7. Felsic volcanic -xl. Tuff. Sparse py, poss po. No carbonate. Med-g, lt grey, sericitic, with sparse mm qz eyes (<1%). Matrix mainly feldspathic. Py to 0.5 cm. QV x-cutting main fabric. Crenulation fabric at 160SE 'dipping' at 36.
632457	<20	QV with coarse cubic py. No carbonate. Diss py throughout. Host is f-g xl tuff.
632458	<20	Same location as preceding. Felsic. Xl tuff with diss py.
632459	<20	As preceding.
632460	80	As preceding
632462	60	F-m g mafic volcanic, cut by QV to 1 cm wide. Sparse py, +?cp. Sulphides are diss to blebby, to 3 mm. No carbonate.
632463	120	1 ft. N. of preceding. As preceding
632464	100	Along strike from preceding, & N of 632462. Chloritic mafic volcanic. Soft, crumbly. Diss py noted. Note samples '62-'64 on same o/c. Dk grey-green weathered surface.
632465	280	Mafic volcanic, just SW of preceding. F-m g. with py, po (diss'd). Chloritic, amygdaloidal.
632466	180	Mafic volcanic. Similar to preceding. To 10%(?) po scattered throughout sample location. X-cut by pyritic, sm QV.
632467	140	Mafic Volcanic with diss. Po. X-cut by pyritic QV. No carbonate.
632468	160	Mafic Volcanic with diss cp. Magnetic "...so some po." X-cut by 1.5 cm wide QV.
632469	100	5 cm wide QV with finely diss py. Host is mafic volcanic.
632470	3700	Ultramafic. V fine acicular white radiating tremolite + v fine dk green actinolite. Qz veined. Magnetic. Cp, po, py noted & mostly at contact with veining. Mr carbonate associated with veinlets. Locally, blebby sulphides.
632471	20	QV with py, cp, "diss into blebs". Veining (unclassified), to 4 cm.
632472	80	Ultramafic. Dk green, with blebs & veinlets of cp, py, po. Host of preceding.
632473	20	Ultramafic rock. Abundant QV resmbling silicification, locally. Cp, py, & diss po noted. Chloritic. At S.end of trench.
632474	<20	Trench sample. Brownish weathering. Mr thin carbonate veining. "Silicified rock". White on fresh surface, with stringers & veinlets to 1 mm of py & poss. Po. A black xl noted - quite hard. (?actinolite or tourmaline)
632475	<20	Very silicified, & similar to preceding. Mr py, poss po. (Magnetism noted). As stringers or disseminations. QV to 0.5 cm noted in o/c.
632476	60	?Ultramafic rock. Dk reddish brown on weathered surface. Crumbly. Tremolitic. Fine radiating acicular xls, often in sheafs/bundles to 3 mm long. Magnetic. Carbonate in veinlets or diss. Py often associated with stronge tremolitisation.
632477	<20	Altered ultramafic. Silicified, poss in 1 lg QV or saccharoidal chert(?) Scattered py. Locally magnetic. Considered to be poss po. Dk grey veining noted carbonatised, especially proximal to py mineralisation. (Calcite-rich)
632479	60	Similar to previous, though slightly more rusty on weathered surface.
632481	20	White orange weathered surface. Appears bedded Strike 338, dip 72. Sulphides in sparse QV as fine threads. Surface is rusty-orange to sulphur yellow.
632495	15100	Sulphidised felsic xl tuff. F-g, from rubble by trench. Most of rock is silicified, w sm cte veining. Sulphides incl py, cp, gn & sp. May in part be calc-silicate mineralised. Sulphides in randomly oriented fractures. Non-magnetic.
632496	6160	In round trench (pit). F-g felsic xl tuff. Non-magnetic, silicified, no carbonate. Sulphides incl py, cp, sp+/-gn & often diss'd along fractures. Qz eyes noted.
632497	120	Med grey, <1% qz eyes to 3 mm. Non-magnetic, with sparse diss py. Well-defined S2. Mr qz veining x-cutting. Lt grey to buff white fresh surface with cavities.
632508	100	Chert, with diss cubic py to 3 mm. + as veinlets.

Sample #	Zn (ppm)	Description
632515	60	Chert-mag IF. Fine sulphides based on weathering. Strike around 100.
632529	60	As preceding. Same sample site.
632530	<20	5-10% qz eyes, to 4 mm. Py-cp to c. 1%. Non-magnetic. End of trench.
632534	80	Actinolitic. Bladed. Blebby py. Locally, wkly magnetic. Pervasively carbonatised. <20% plag.
632537	7060	Magnetic, locally. Pyritic in stock-work & veinlets.
632538	200	At contact between mafic volcanic (chloritic), well foliated, magnetic, cut by QV+Fe-carbonate veins, & felsic volcanic.
632539	100	As preceding, (but not differentiated). Both pyritic.
632540	40	Strongly magnetic, with intense Fe-carbonate alteration. Well defined fabric, no visible sulphides. Close to lg QV to 50 cm wide. Serpentinitic.
656420	160	BIF & argillite. Bands of cte & Fe-carbonate (?) massive sulphides at 1 locale (sampled - 656421) Locally yellow staining (limonite??) NVS. Banding at 115/61. Thick bed of grey finely laminated argillite within IF.
656421	80	Massive sulphide sample in IF Location as 656421
656422	20	Thin lamellar mt. Remainder chert. Diss, blebby & veinlet py, w latter parallel to main fabric/layering.
656431	<20	Dolomitised, QV at N edge of long o/c. V wkly fuchsitic. Albitised, sericitised, with possible late microcline. Stringer chl & poss v fine asp. Host unknown. Only carbonate-qz observed over 50m long x 2m wide.
656432	<20	Same location as 656431
656433	100	Same location as 656431.
656434	120	No veining observed. Old trench, trace py. Trace ?cp F-g.
656436	140	Non-magnetic, NVS. Abundant Fe-carbonate. By shoreline.
656438	100	Well foliated rock,weat'd srfc md gy, frsh srfc md gn, fgr, non mag'c, no carb, sm cubes of py <1mm across, plag, bt, chl/amph.
656439	100	Similar to above. Flows interbdd w 2m ct layers. Py in maf volc here is diss'd w smears on slip faces.
656440	20	Mgr, frsh srfc gy, weat'd surf dk gy, v-soft, no carb, magnetic, no visible sulphides, massive, mainly serp &/or chl, no veins
656441	20	Fgr, weat'd srfc lt gy, frsh srfc md gn, dk gn on polished srfc, magnetic, cntns sm xtls of mt (<0.2mm), some carb, no sulphides, massive, composed of mt and lt gn scratchable min - serp?, prev mppd as anorthosite by Toby+Lea and as serpentinite by OGS.
656443	20	Fgr, lt gy to white weat'd srfc, dk gy w lt gn frsh srfc, v-hard so silicified?, mt xlts, some mt veins ~0.5mm wide, no visible sulphides, no carb.
656444	<20	V-soft (scratches with nail), lt gy frsh srfc, lt gy/white weat'd srfc, magnetic, mostly serp + talc (?-white), some carb, massive, no visible sulphide, <1% visible mt xtls.
656447	<20	Yellowish-gy weat'd srfc, gy frsh srfc, magnetic, some mt xtls, ksp+ep alt'n veins w galena, hematite staining, negligible amount of carb, rock is not scratched by knife, no visible sulphides.
656448	60	Rock scratched by knife, lt gy weat'd srfc, md gy frsh srfc, carb veins, weakly mag, no sulphides, lt pink from hematite staining?, some talc bc white & scratched by nail.
656449	20	V-weakly mag, carb veins throughout oc, v-soft, lt gy frsh srfc, dk gy weat'd srfc, porphyroblasts of dk gy min, no sulphides, composed of serpentine.
370601	<20	V-soft (scratched by nails), x-cut by veins of carb that are flattened in one way and stretched in the other, serp+talc, v-lt gy fresh srfc, lt gy weat'd srfc, non mag, no sulphides, no carb.
370602	<20	Lt gy weat'd srfc, md gy frsh srfc, non magnetic, soft, no visible sulphides, x-cut by Fe-carb veins (lt brown-orange) up to 5cm wide, massive, fgr, <0.2mm black xtls of chromite +/-talc?, &/or sericite?
370603	20	Md gn weat'd srfc, md gy frsh srfc, ~1% well rounded clear qz eyes up to 3mm in diameter, sericite, chl?, scratched lightly by knife, some carb, no visible sulphides, non magnetic, slight hematite staining giving rock a lt pink stain, fgr.
370604	20	Fgr, massive, weakly magnetic where ocre coloured stain and veining is, lt gy weat'd & frsh srfc, talc+sericite, poss serp?, no sulphides, scratches w knife, talc sericite schist (alt'd ultramafic).
370605	<20	Depending on qty of talc there are diff strenghts of magnetism (low talc-magnetic, high-talc-non-magnetic), lt to md gy frsh srfc, no sulphides, soft, x-cutting Fe-carb staining, massive, fgr.
370606	20	Lt gy weat'd srfc, md gy frsh srfc, fgr, massive, magnetic, no sulphides, serp+bt, x-cutting carb veins up to 2cm wide, pitted weat'd srfc.
370607	60	V-soft, magnetic, no visible sulphides, full of carb giving it a lt brown colour in certain areas, lt gy to white weat'd srfc, md gy frsh srfc, serp, bt (more in fuch-poor parts of oc), mgr, pitted weat'd srfc, fuch vein? Or alt'n.
370608	100	Mostly plag, some act, white weat'd srfc, md gy frsh srfc, fgr, 1.5m wide, v-fgr diss tarnished cubic py, weakly mag (mt or po?), near cntct w ultramafic it is more mafic looking (w bt &/or chl).
370609	20	Cntns metallic xtls <0.1mm that doesn't streak and is non magnetic (chromite?).
370612	60	Similar to 437 but white weat'd srfc, act xtls not as cgr (2cm long), lots of plag on weat'd srfc in btw lbades of amph (looks like spinifex txt), no sulphides, non magnetic.
370613	20	V-magnetic, soft, md gn weat'd srfc, md gn frsh srfc, fgr, no sulphides, poss some carb, mostly serp but some bt.
370615	140	Lt gn weat'd srfc, mf gn frsh srfc, ~2-3% well rounded qz eyes up to 2mm in diameter, non magnetic, fgr, massive, scratched by knife, gn min prob chl, no sulphides, no visible plag, x-cut by ~4mm wide qz veins.
370616	40	Lt gy weat'd srfc, lighter gy frsh srfc, v-magnetic, mostly comp'd of lt gy flaky serp that turns brownish orange near weat'd srfc, ~2%bt xtls, soft, carb(?) in veins 3mm wide, no sulphides, mgr.
370618	100	Lt gy weat'd srfc, lt gy-gn frsh srfc, non magnetic, fgr, carbonatized, v-hard, plag+act, no sulphides, homogeneous, <25% amph.
370619	80	Fgr, non magnetic, no carb, no sulphides, lt gy-gn weat'd srfc, dk gn frsh srfc, soft, prob chl+act+pplag, massive.
370620	60	Non magnetic, carbnatized (lcl carb-poor), lt gy-gn weat'd srfc, dk gn frsh srfc, <1% diss <0.5mm cubic py, v-fgr, hard, act+plag (50-50).
370617	40	Lt gy weat'd srfc, lt gy frsh srfc, no carb, wkly magnetic, massive, serp, no sulphides, fgr, pitted weat'd srfc, musc?
370621	1480	Dk gy weat'd & frsh srfc, sm shear zone w Fe-carb veins pll to shear, qz-carb ladder veins, ~10% po(magnetic)-py-cp, mineralization in veinlets and diss in carb veins creating massive sections 0.5cm wide, act alt'n.

Appendix 4

Assay certificates from XRAL Laboratories

P.O. No.	:	
Project No.	:	TROUT BAY
No. of Samples	:	26 Rocks
Date Submitted	:	13/08/01
Report Comprises	:	Cover Sheet plus Pages 1 to 10

Distribution of unused material:
Pulps: Pulps returned after 90 days of reporting.
Rejects: Rejects returned after 30 days of reporting.

Certified By :

per
Dr. Hugh de Souza, General Manager
XRAL Laboratories

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result
*INF	= Composition of this sample makes detection impossible by this method		

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Work Order: 064725 **Date:** 29/08/01 **FINAL**

CERTIFICATE OF ANALYSIS

Work Order: 064724

To: Goldcorp Inc.
Attn: T. Hughes

Date : 29/08/01

P.O. Box 190 HWY 125
COCHENOUR
ONTARIO/CANADA/P0V 1L0

Copy 1 to :

P.O. No.	:	
Project No.	:	TROUT BAY
No. of Samples	:	15 Rocks
Date Submitted	:	14/08/01
Report Comprises	:	Cover Sheet plus Pages 1 to 6

Distribution of unused material:
Pulps: Pulps returned after 90 days of reporting.
Rejects: Rejects returned after 30 days of reporting.

Certified By :

Dr. Hugh de Souza, General Manager
XRAL Laboratories

ISO 9002 REGISTERED

Subject to SGS General Terms and Conditions

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result
*INF	= Composition of this sample makes detection impossible by this method		

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

CERTIFICATE OF ANALYSIS

Work Order: 064369

To: **Goldcorp Inc.**
Attn: T. Hughes

Date : 08/08/01

P.O. Box 190 HWY 125
COCHENOUR
ONTARIO/CANADA/P0V 1L0

Copy 1 to :

P.O. No.	:	
Project No.	:	TB
No. of Samples	:	42 Rock
Date Submitted	:	23/07/01
Report Comprises	:	Cover Sheet plus Pages 1 to 12

Distribution of unused material:
Pulps: Return
Rejects: Return

Certified By :

Dr. Hugh de Souza, General Manager
XRAL Laboratories

ISO 9002 REGISTERED

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result
*INF	= Composition of this sample makes detection impossible by this method		

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Work Order: 064369 **Date:** 08/08/01 **FINAL**

CERTIFICATE A0128368

(IKH) - GOLDCORP INC.

Project: TROUT BAY
P.O. # :

Samples submitted to our lab in Thunder Bay, ON.
This report was printed on 20-NOV-2001.

SAMPLE PREPARATION

METHOD CODE	NUMBER SAMPLES	DESCRIPTION
255	20	RUSH Geo ring to approx 150 mesh
295	20	RUSH crush and split (0-3 Kg)
3202	20	Rock - save entire reject
290	20	Assay HF ICP digestion charge

ANALYTICAL PROCEDURES

METHOD CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
Au-MS23r	20	Au ppb: Fuse 30g-ICPMS RUSH	FA-ICPMS	1	1000
Pt-MS23	20	Pt ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	0.5	1000
Pd-MS23	20	Pd ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	1	1000
1263	20	Ag ppm: high grade 24 element	AAS	1	200
4031	20	Al %: A22 ICP package	ICP-AES	0.05	30.0
4032	20	Ba ppm: A22 ICP package	ICP-AES	100	50000
4033	20	Be ppm: A22 ICP package	ICP-AES	10	10000
4034	20	Bi ppm: A22 ICP package	ICP-AES	20	50000
4035	20	Ca %: A22 ICP package	ICP-AES	0.05	30.0
4036	20	Cd ppm: A22 ICP package	ICP-AES	10	10000
4037	20	Co ppm: A22 ICP package	ICP-AES	10	100000
4038	20	Cr ppm: A22 ICP package	ICP-AES	10	100000
4039	20	Cu ppm: A22 ICP package	ICP-AES	10	100000

CERTIFICATE A0121528

(IKH) - GOLDCORP INC.

Project: TROUT BAY
P.O. # :

Samples submitted to our lab in Thunder Bay, ON.
This report was printed on 14-AUG-2001.

SAMPLE PREPARATION

METHOD CODE	NUMBER SAMPLES	DESCRIPTION
255	38	RUSH Geo ring to approx 150 mesh
272	38	RUSH 4-7 Kg crush and split
3202	38	Rock - save entire reject
290	38	Assay HF ICP digestion charge

ANALYTICAL PROCEDURES

METHOD CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
Au-AA23r	6	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
Au-MS23	32	Au ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	1	1000
Pt-MS23	32	Pt ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	0.5	1000
Pd-MS23	32	Pd ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	1	1000
1263	38	Ag ppm: high grade 24 element	AAS	1	200
4031	38	Al %: A22 ICP package	ICP-AES	0.05	30.0
4032	38	Ba ppm: A22 ICP package	ICP-AES	100	50000
4033	38	Be ppm: A22 ICP package	ICP-AES	10	10000
4034	38	Bi ppm: A22 ICP package	ICP-AES	20	50000
4035	38	Ca %: A22 ICP package	ICP-AES	0.05	30.0
4036	38	Cd ppm: A22 ICP package	ICP-AES	10	10000
4037	38	Co ppm: A22 ICP package	ICP-AES	10	100000
4038	38	Cr ppm: A22 ICP package	ICP-AES	10	100000
4039	38	Cu ppm: A22 ICP package	ICP-AES	10	100000
4040	38	Fe %: A22 ICP package	ICP-AES	0.05	30.0
4041	38	K %: A22 ICP package	ICP-AES	0.1	20.0
4042	38	Mg %: A22 ICP package	ICP-AES	0.05	30.0
4043	38	Mn ppm: A22 ICP package	ICP-AES	10	100000
4044	38	Mo ppm: A22 ICP package	ICP-AES	10	100000
4045	38	Na %: A22 ICP package	ICP-AES	0.05	20.0
4046	38	Ni ppm: A22 ICP package	ICP-AES	10	100000
4075	38	Pb %: high grade 24 element	AAS	0.001	10.00
4047	38	Sr ppm: A22 ICP package	ICP-AES	10	100000
4048	38	Ti %: A22 ICP package	ICP-AES	0.05	20.0
4049	38	V ppm: A22 ICP package	ICP-AES	10	50000
4050	38	Zn ppm: A22 ICP package	ICP-AES	20	100000

CERTIFICATE A0121814

(IKH) - GOLDCORP INC.

Project: TROUT BAY
P.O. # :

Samples submitted to our lab in Thunder Bay, ON.
This report was printed on 14-AUG-2001.

SAMPLE PREPARATION

METHOD CODE	NUMBER SAMPLES	DESCRIPTION
255	18	RUSH Geo ring to approx 150 mesh
295	18	RUSH crush and split (0-3 Kg)
3202	18	Rock - save entire reject
290	18	Assay HF ICP digestion charge

ANALYTICAL PROCEDURES

METHOD CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
Au-MS23	18	Au ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	1	1000
Pt-MS23	18	Pt ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	0.5	1000
Pd-MS23	18	Pd ppb: Fuse 30g - ICPMS Finish	FA-ICPMS	1	1000
1263	18	Ag ppm: high grade 24 element	AAS	1	200
4031	18	Al %: A22 ICP package	ICP-AES	0.05	30.0
4032	18	Ba ppm: A22 ICP package	ICP-AES	100	50000
4033	18	Be ppm: A22 ICP package	ICP-AES	10	10000
4034	18	Bi ppm: A22 ICP package	ICP-AES	20	50000
4035	18	Ca %: A22 ICP package	ICP-AES	0.05	30.0
4036	18	Cd ppm: A22 ICP package	ICP-AES	10	10000
4037	18	Co ppm: A22 ICP package	ICP-AES	10	100000
4038	18	Cr ppm: A22 ICP package	ICP-AES	10	100000
4039	18	Cu ppm: A22 ICP package	ICP-AES	10	100000
4040	18	Fe %: A22 ICP package	ICP-AES	0.05	30.0
4041	18	K %: A22 ICP package	ICP-AES	0.1	20.0
4042	18	Mg %: A22 ICP package	ICP-AES	0.05	30.0
4043	18	Mn ppm: A22 ICP package	ICP-AES	10	100000
4044	18	Mo ppm: A22 ICP package	ICP-AES	10	100000
4045	18	Na %: A22 ICP package	ICP-AES	0.05	20.0
4046	18	Ni ppm: A22 ICP package	ICP-AES	10	100000
4075	18	Pb %: high grade 24 element	AAS	0.001	10.00
4047	18	Sr ppm: A22 ICP package	ICP-AES	10	100000
4048	18	Ti %: A22 ICP package	ICP-AES	0.05	20.0
4049	18	V ppm: A22 ICP package	ICP-AES	10	50000
4050	18	Zn ppm: A22 ICP package	ICP-AES	20	100000

Target: Presumably tested zinc mineralisation exposed in old pit.

Comments: Hole not located in field.
Hole retrieved from MNDM core farm, Red Lake, following >3000 ppb Au grab sample from a pit.
DDH considered to have tested the mineralisation, based on geology, DDH map & Noramco report.
Core returned to Red Lake MNDM core library.

0.00	**3.50**	**OVERBURDEN (0B)**	No	-		-	-		-	-		-	-	-	-	-	-	-	-	-	-	-	-	-		-	-	-	-	-	-	-	-	-		-
3.50	**9.75**	**Dacite (Ash)-Lapilli Tuff (2C)** Medium grained, with abundant altered, rounded, poorly flattened plagioicase, with chilled edges. Av diameter, <0.5 mm. Well sorted, self-supported, with inor coalescent or atoll-style feldspar & sparse qz. Atoll stuctures reflect either fine opaques or silica within feldspars. <1% irregular, detrital pseudofiamme of bte +/- <0.1% py. Lineation defined by bte or very fine albitic+/- micaceous slips. CAF at 70+. Nil matrix carbonate, & <0.1% veining. Gradational lower contact, with incresing chlorite in matrix. Foliated.	No	0	FOL	2	72		-	-		-	-	-	-	-	-	-	-	-	-	1	-	1	-		-	0	-	-	-		-	0	-	0		-
9.75	**16.30**	**GABBRO (6G)** Medium grained, not coarse, with wide chilled margins. Trace magnetite. Abundant sub-idioblastic amphibole. Massive to lineated, with slight alignment of amphibole. Mafics to 2 mm diameter, (average); locally porphyroblastic or felty-bladed, more actinolitic, though defined more by bladed plagioicase. Very poorly chloritised.	No	1	FOL	1	72		-	-		-	-	-	-	-	-	-	-	-	-	-	-	-	-	AM	1	-	-	-	-		-	-	-	-		-
16.30	**33.30**	**Dacite Tuff (2C)** Grey, locally, pale grey. Scattered, weakly elongate to 3:1 plagioclase to 2 mm, set in a grey, fine grained, occasionally very silicic matrix. Section appears annealed, flattened & may well be welded in part, with recrystallisation, present over dm widths. Effect is an irregular, discontinuous <1mm wide lamellar fabric. S-planes >75, often 85 to CA. Sparse, <0.2%, thin bte flamme (ss). Some colouration producing vague banding reflects cyclical pulses of variable qz & feldspar content & grain size. (High T laminar ash flows).	No	0	RIB	1	75		-	-		-	-	-	-	-	-	-	-	-	-	1	-	1	-		-	0	-	-	-		-	-	-	-		-

		27.5-28.6 Qz veining with weak calcite & late to post-kinematic. Weak interstitial chlorite. Still in a weakly welded dacite tuff. Veining at 40 & 80 to CA. High angle veining is weakly dolomitic, & may be associated with felty chlorite banding. At depth, more plagiolcase blastic/phyric, lineated, with <0.2% very fine bte & opaques, trace py. Merges into:																																			
33.30	38.40	**Dacite Lapilli Tuff (2C)** More equigranular, with intersitial fine bte & opaques more prominent. Very weakly lineated, with some 2% sub-vitreous to white, 55-75 to CA, qz+/-chlorite+/-tourmaline. Abundant fine, quenched plagioclase lapilli in a recrystallised, weakly silicic matrix. Well soretd. Probably a single pyroclastic eruptive event.	No	0	FOL	1	-		-	-		-	-									1	-	-	-		-						-					-
38.40	40.60	**Dacite Tuff (2C)** As preceding, with 60% possibly welded or quite silicic, finer, with distinct fine sericite threads, OR lineated, finely sericitic. <0.2% carbonate+/-chlorite threads/veinlets, associated with localised feldspathic blastisation. CAF 60-48.	No	0	FOL	1	-		-	-		-	-														-						-					-
40.60	73.00	**Dacite Lapilli Tuff (2C)** Comprises some 80% feldspar to 2 mm diameter. Sub-idioblastic to rounded, set in s fine, weakly silicic matrix. 0.2 to 3% fleck lineate, rarely very finely fragmental biotitic, to 2 mm in length. Non-magnetic, trace py. CAB averages 72. Locally bleached, more massive, medium grained, annealed, still feldspathic. Unit may contain dm-0.5 m wide concentrations of patchy silicic, truly welded tuff, e.g. 67.5-68.1; OR very fine blastic ash bedded, e.g. 55-55.1. Possible laminar ?surge deposits, being finely layered. 57.8-59.2 3% late qz veining, with <1% py-cp-sp. Sulphides are late, undeformed. Host is weakly	No	0	FOL	1	-		-	-		-	-									1	-	1	-	AB	1	1	0	0	0		-	1	-	1		-

From	To				Fabric 1			Fabric 2			Fabric 3			Structure			Alteration									Sulphide (%)						Veins (%)

Dear Sir or Madam

Subject: Approval of Assessment Work

We have approved your Assessment Work Submission with the above noted Transaction Number(s). The attached Work Report Summary indicates the results of the approval.

At the discretion of the Ministry, the assessment work performed on the mining lands noted in this work report may be subject to inspection and/or investigation at any time.

If you have any question regarding this correspondence, please contact BRUCE GATES by email at bruce.gates@ndm.gov.on.ca or by phone at (705) 670-5856.

Yours Sincerely,

Ron Gashinski
Senior Manager, Mining Lands Section
