CONCLUSIONS

The 1983 field investigations on our Earngey property were successful in outlining a number of interesting areas.

Correlation of geology, geochemistry, geophysics and known deposits has shown our targets to be structures cross-cutting the regional stratigraphy, possibly capped by an impermeable layer at a hiatus in volcanism. The Uchi Mine is the most obvious example of this type of deposit and our investigations indicate similar situations on our property, including the Main Zone.

The area of prime interest remains the previously drilled (1959) Main Zone, where this year's blasting and sampling revealed mineralization in the eastern 75 m of the trench. Previously, we had no information on that area.

Our secondary targets are the "Millberry vein" and an area at the east end of lines 1 and 2 south (the highest geochemical response area). Numerous smaller targets exist which should be evaluated with small detail grids next summer.

2.0

INTRODUCTION

This report describes the 1983 activities of Orofino Resources Ltd. on its property on Uchi Lake, Earngey Township in northwestern Ontario.

Aerodat Ltd. of Mississauga performed helicopter borne EM and Mag. to delineate structure, rock types and bedrock conductors. Claim staking and grid lines for ground survey control were contracted through Ed Rose of Sudbury. Ground geochemical and geological surveys were performed by Orofino personnel, R. Zinn, Project Geologist, D. Vasiga, Senior Geological Assistant, R. Vail, Technician and S. Orth, Junior Geological Assistant.

3. PROPERTY AND LOCATION (NTS 52 N/2) Figures 1, 2 + Table 1

The property is located in west central Earney Twp. on the west side of Uchi Lake immediately south of the Uchi Lake Mine (a former producer) and 8 km southeast of the South Bay Mine. There are 41 claims of which 11 are leased and 30 were staked in 1983, to protect strike extensions of known trends on the leases and make the property contiguous with the Uchi Lake Mine patented claims in the northwest.

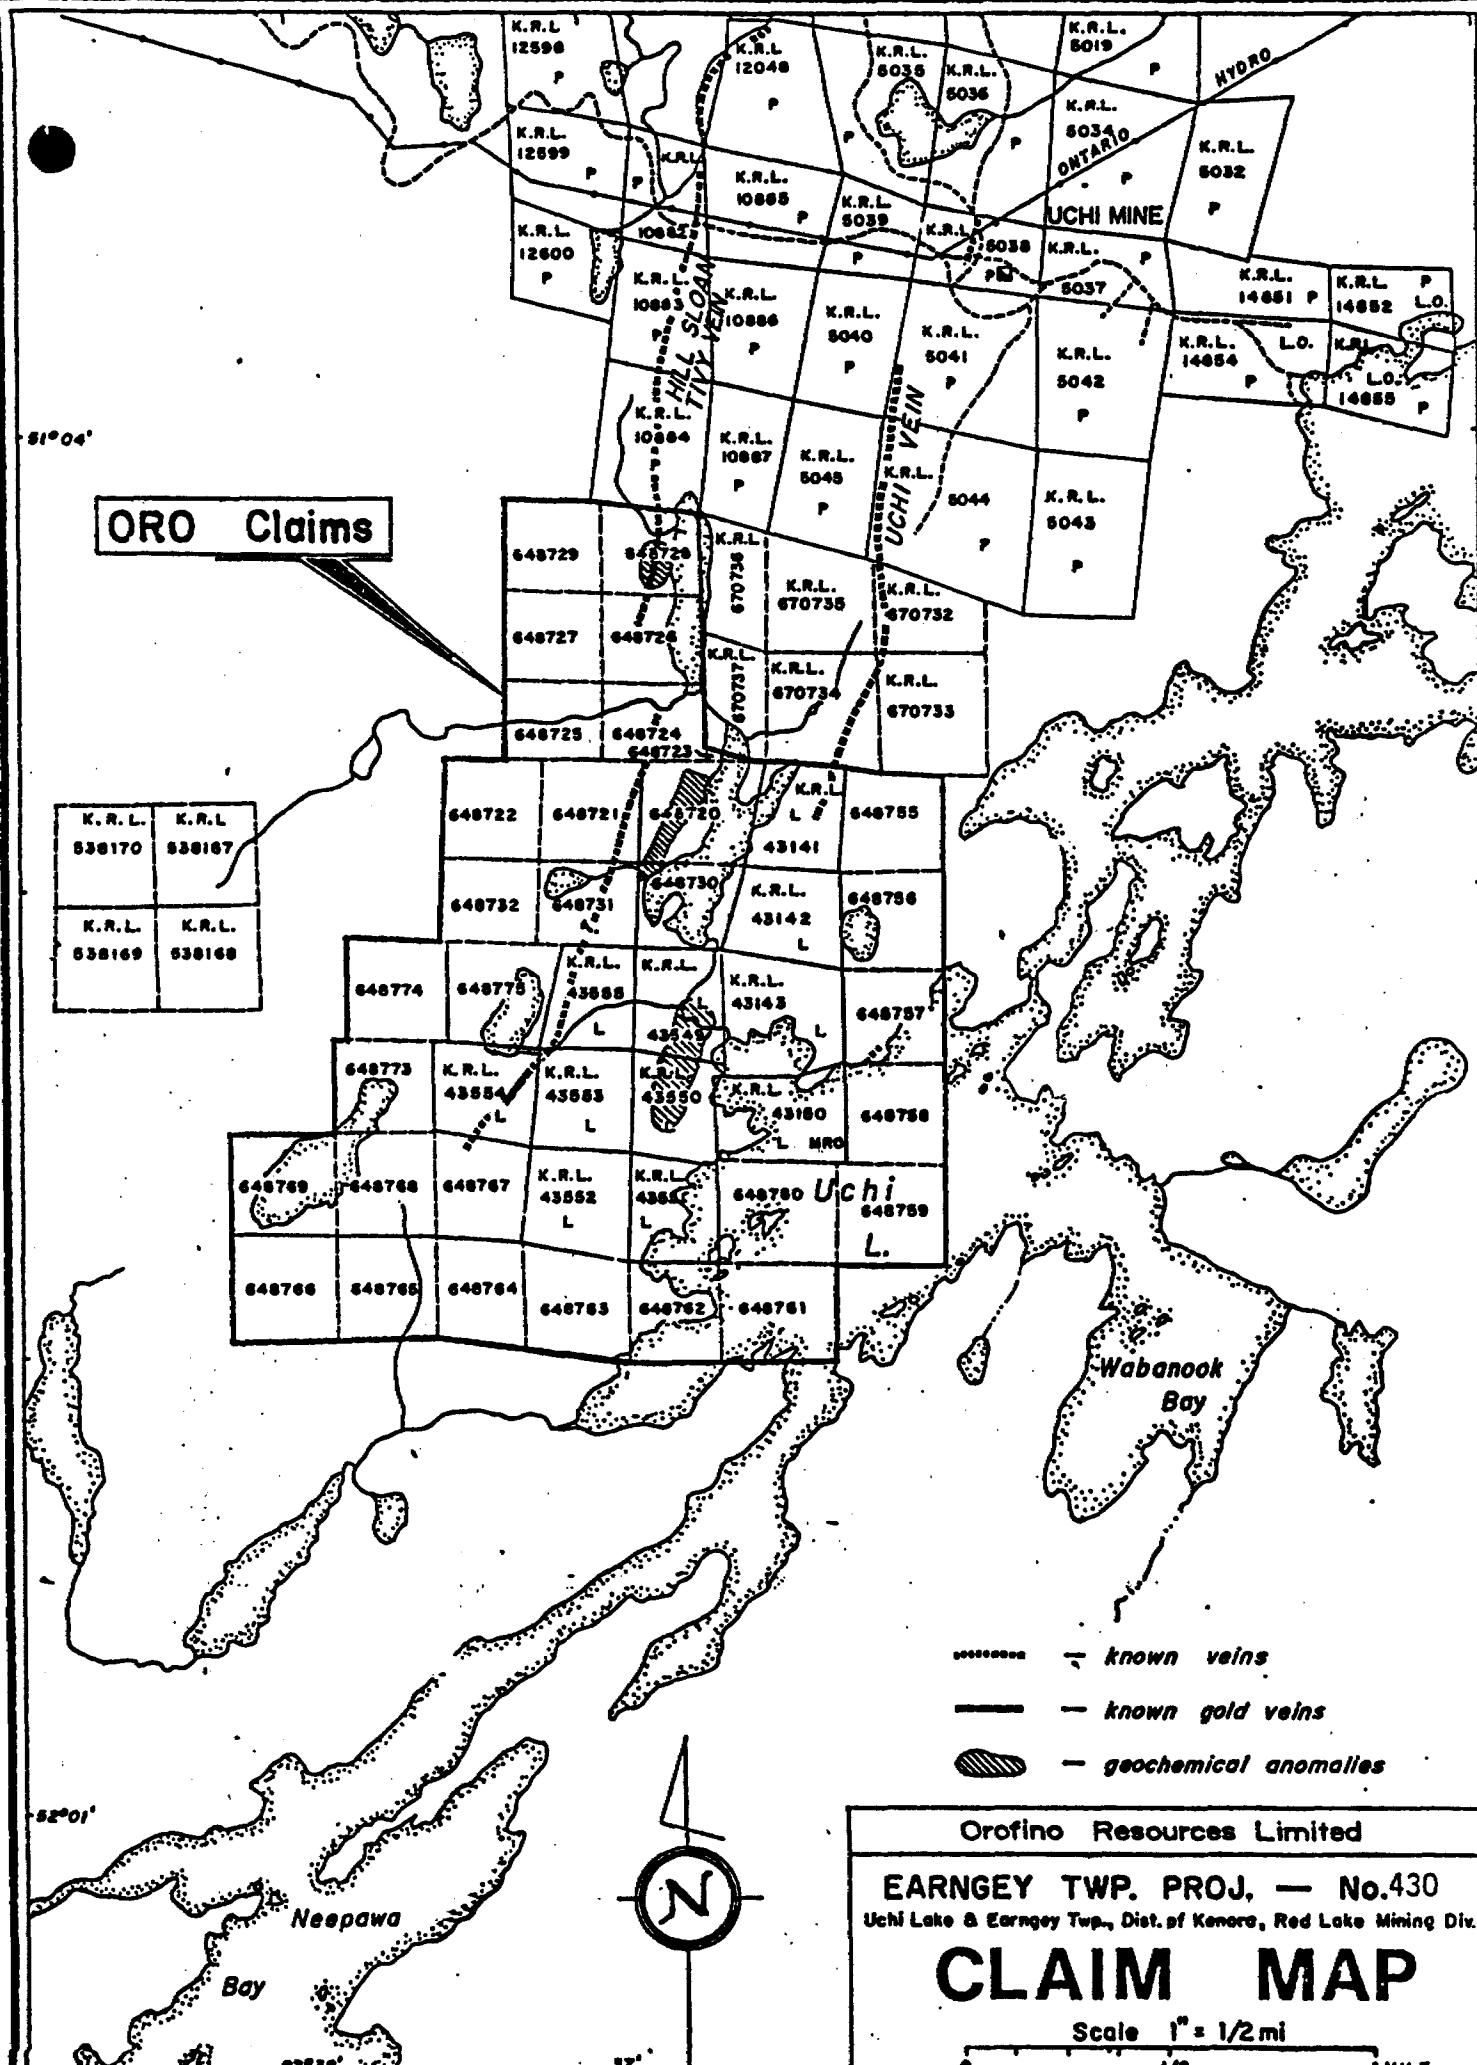

4.0 ACCESS Figure 3

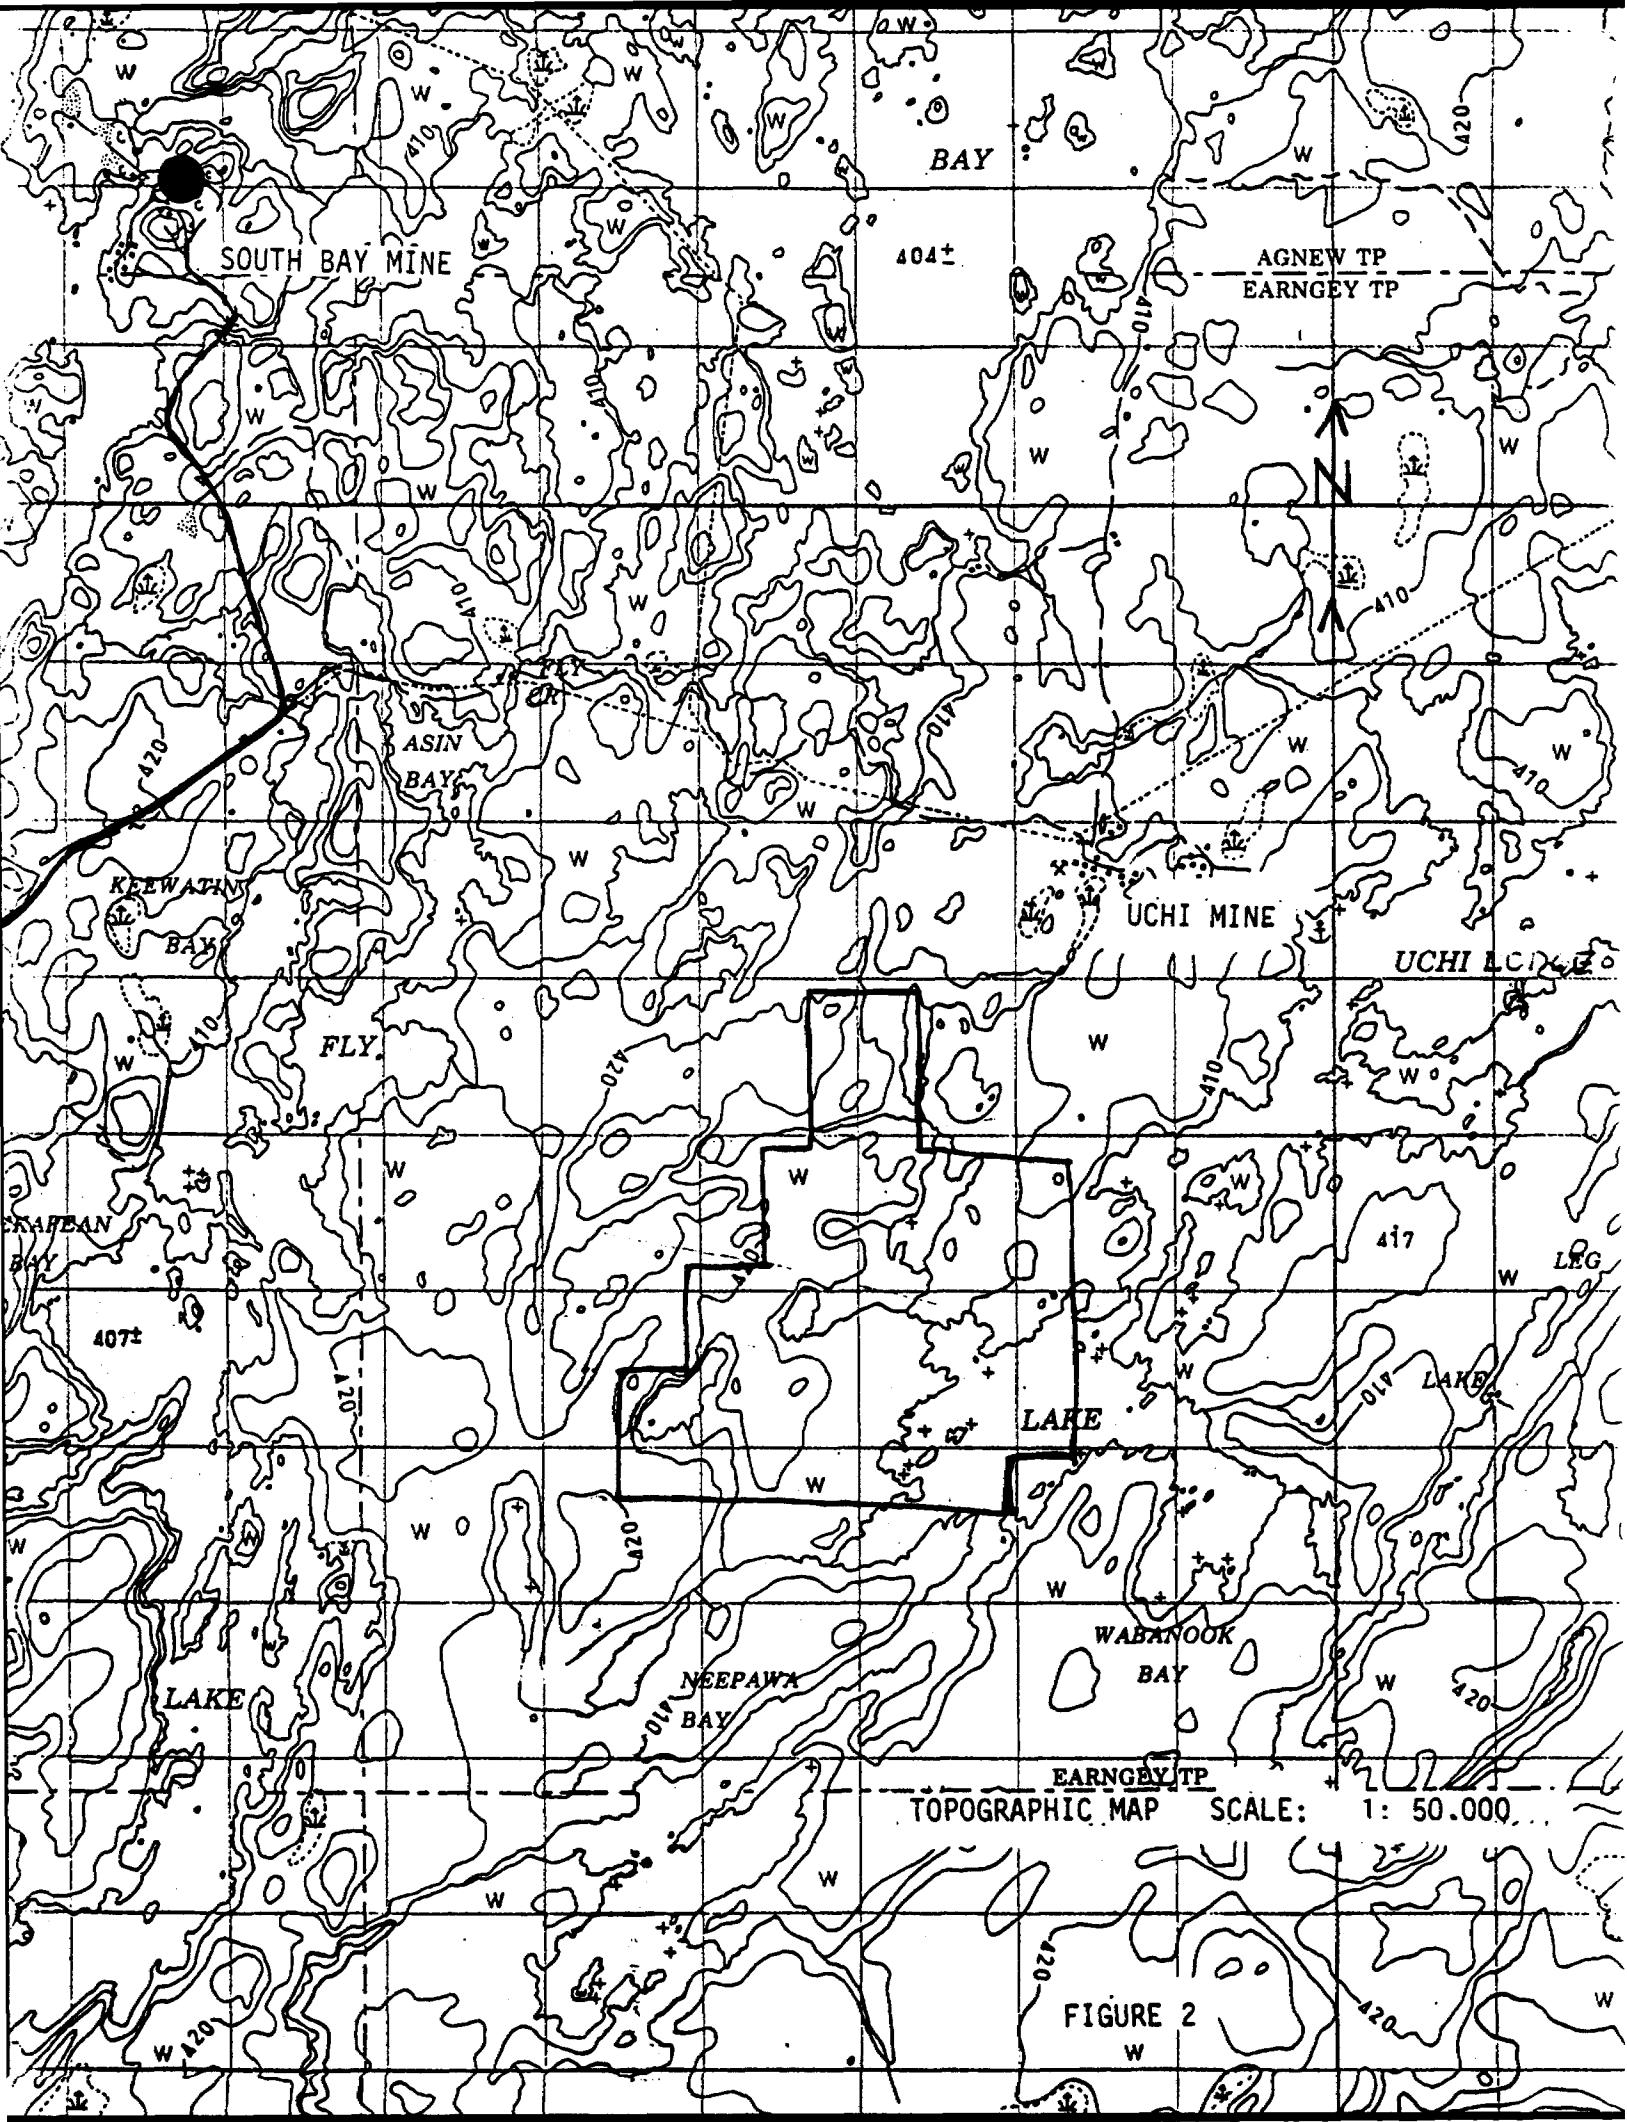

Access is via air from Red Lake or Ear Falls with Ear Falls being marginally closer. Alternative road and water access is by 80 kms of road northeast from Ear Falls to Confederation Lake near South Bay, and by boat across the lake from where Uchi Lake Lodge maintains a truck on the old road system from Uchi Lake to Lost Bay on Confederation Lake and may portage people and supplies. Uchi Lake Lodge also has a radio telephone which simplified communications to the outside world. Apparently the road from South Bay Mine around the south end of Confederation Lake to Uchi Lake could be reopened by constructing new bridges (culverts) over a number of small streams (Personal Communication Uchi Lake Lodge, Manager).

5.0 CLIMATE

The project area has a continental climate characterized by temperature extremes and moderate to light precipitation. Winter temperatures are often less than -30°C with summers often exceeding +30°C. Break-up of Lake ice is in mid May and freeze-up is in November.

6.0 TOPOGRAPHY

The Earney Property is typical of the Precambrian Peneplain ie. predominantly low mature spruce bog with occasional long low ridges of rock outcrops, long narrow lakes, and small pot hole ponds. The trend of the topography is approximately 015°.

7.0 WATER AND TIMBER

Water for all purposes is readily available anywhere on the property. The timber ranges from open mature to overmature with dense second growth. The northwest section of the property was burned over about 10 years ago and is regrowing with dense alder thickets. This area is difficult to traverse due to all the fallen timber.

8.0 POWER

Hydroelectric power is available from the main powerline that services the South Bay Mine some 8 km (5 miles) to the northwest.

9.0 LABOUR EQUIPMENT AND SUPPLIES

The Town of Ear Falls is a centre for Great Lakes Forest Products and as such has several mini depots for heavy equipment. Also the Griffith Mine (an iron ore deposit) is located approximately 10 km. north of the town giving a small local skilled labour force. The nearest major mining community is Red Lake which has a large skilled labour force experienced in gold mining.

The South Bay Mine, a former copper zinc producer (on exhaustion of ore reserves) was mothballed in 1981 rather than dismantled in anticipation of the former Uchi Lake Mine reopening. Its facilities include a townsite, power, water, and a 500 ton per day mill with tailings pond.

Local lakes are highly utilized by the tourist industry for fishing and hunting. Uchi Lake Lodge can provide emergency food and fuel supplies.

10.0

HISTORY

The property was originally held by Woco Gold Developments and B. Milberry. Milberry optioned his claims (our 6 N.W. claims) to Woco in 1937. Woco proceeded to investigate a gold bearing vein (possible extension of the Hill-Sloan-Tivey vein) by trenching and diamond drilling over a distance of 750 feet. Four drill holes returned values of 0.03 over 2 feet, 0.24 over 2 feet, 0.14 over 1 foot, and 0.203 over 3 feet. The option was subsequently dropped.

Woco Gold Development's prospector Fred Bergkvist discovered what is now the main zone in June, 1939. The vein was stripped, trenched and channel sampled and proved to be of economic interest. Assay results of channel sampling gave an average of 0.41 oz/ton Au over a 4.5' width and a length of 205'. Woco then drilled the prospect establishing gold values to a depth of 100'.

The property was optioned in 1939 to a group of 5 companies namely; Coniagas, Cyril Knight Prospecting, Anglo Huronian, Howey Gold Mines and Northern Canada Mines Ltd. who drilled the gold mineralization to 300'. The zone was indicated to plunge to the north as drilling to 500' failed to intersect the zone in the south.

The property remained inactive but still held by the syndicate until after World War II when an adverse gold market caused them to return the claims to Woco. Woco then allowed them to lapse.

Sidney Thompson restaked 17 of the claims including the main showing in 1958 and optioned them to Kirk-Hudson Mines which subsequently became Northgate Exploration Limited.

Northgate undertook a diamond drilling programme in 1959 hoping to prove gold mineralization to a depth of at least 500'. Seven holes were drilled with the deepest intersection being 0.4 oz. Au/Ton at 500'. At that point an estimate of ore reserves was made of 64,600 tons, grading 0.28 oz./Au/ton. The property was then brought to lease,

The claims immediately north of the leases were the subject of a detailed geological mapping programme carried out by L.J. Kuryliw in 1968. These claims include the former Milberry Property. Evidence was found in outcrop for an extension of the main Uchi break on what is now claim 648755. While surface assays were low drilling may find improved mineralization at depth.

With the rapid increase in the price of gold Northgate undertook a re appraisal of the property in 1981. Dr. Simon Haynes and two students cleaned out and detail mapped the old trenches of the main showing. This was hampered by high water in the swamp adjacent to the trenches. A small 20 X 10 m flag grid was established for mapping, V.L.F. and MAG. control. Unfortunately the line orientation was almost 90° out for the geophysics.

In 1983 Northgate Exploration Ltd. included this property with those assigned to Orofino Resources Ltd. Orofino then staked the additional claims and undertook a summer exploration program.

11.0 GEOLOGY

11.1 Regional Geology

The Regional Geology has been described in excellent detail by P.C. Thurston in:

O.G.S. Open File Report 5373
Physical Volcanology and Stratigraphy
of the Confederation Lake Area 1982

The abstract of which follows;

Archean volcanic rocks in the Confederation Lake area northwestern Ontario, are in three mafic to felsic cycles collectively 8,500 to 11,240 m thick. Each cycle begins with pillowed basalt and andesite flows and is capped by andesitic and rhyolitic pyroclastic rocks and minor flows. Cycle I is believed to be entirely subaqueous as it is overlain by 90 m of limestone. Cycle II has basal pillowed basalt flows and andesitic to rhyolitic pyroclastic rocks locally overlain by 100 to 150 m of rhyolite tuff with intensely welded fragments. The environment of deposition of this unit appears to have been subaerial. Cycle II is overlain by stromatolitic limestone and pillowed basalt flows at the base of Cycle III. The remainder of Cycle III consists of dacitic pyroclastic rocks, rhyolitic flows, pyroclastic rocks and coeval hypabyssal intrusions.

Cycle I rhyolites are 2,959 Ma old, Cycle II rhyolites are 2,794 Ma and Cycle III rhyolites are 2,739 Ma old according to U-Pb age determination on zircons. These time periods are in accord with observed periodicity in young volcanic terrains.

Cycle I is interpreted as a platform upon which Cycle II was deposited in the early stages of caldera development. Cycle III is the central graben of the caldera and is the product of resurgent volcanism, hypabyssal intrusions, and late stage hydrothermal activity which formed the Cu-Zn-Ag massive sulphide body of South Bay Mine. The tectonic scheme favored on the basis of structural, lithologic, and chemical parameters is that of a marginal basin behind a volcanic arc.

11.2 Local Geology

The property is underlain by Cycle II volcanics and mafic to ultramafic intrusives. The volcanics are predominantly interbedded tuffs and ignimbrites. All rock types have been regionally metamorphosed to Greenschist facies grade.

Mafic Volcanics: These occur as relatively thin bedded pillow to pillow breccia flows and tuffs. They are typical of greenschist facies altered basalts in that they are highly chloritic with minor epidote and sulphides. There are rare cases of amphiboles within pillows. Weathered surfaces are green-grey while fresh surfaces are dark green.

Some discussion exists as to whether or not the mafic intrusives are coarse grained centres of thick mafic flows.

Intermediate Volcanics: These occur primarily as subaqueous tuffs and Tapilli tuffs. They are fine grained, weather grey on surface and are light green on fresh surfaces. Bedding can be identified on occasion with both normal and reverse grading present.

Felsic Volcanics: The felsic volcanics are primarily rhyolitic tuffs and Tapilli tuffs. They weather white and are pale yellow grey on fresh surface. This unit typically carries 1-5% disseminated pyrite as small euhedral crystals. The rhyolite tuff on the shore of Uchi Lake (claim 43150) contains greater than 10% pyrite. A number of these tuffs were sampled for gold but returned uniformly low assays.

Chemical Metasediments: This unit is found in a topographic depression just west of Hazard Lake. It does outcrop on the shore at the end of the baseline (15N) where about 2m X 1m of banded cherty oxide facies iron formation is exposed. The unit is interpreted as an exhalite deposited during a hiatus in volcanism. It occurs at the top of a volcanic cycle lapping a rhyolite tuff. It is probably related to the Hill-Sloan-Tivy chert "vein" horizon to the north.

Mafic to Ultramafic Intrusives: The intrusives range from diorite to olivine gabbro. They occur as Tenticular pods paralleling regional stratigraphy usually between flows. The weathered surface is tinged orange-brown typical of ultramafics and the fresh surface displays a dark green or green and white appearance. The rock is coarsely crystalline with feldspar laths in the 2-3mm range.

11.3 Economic Geology

The area model is the Uchi Mine, a Quartz vein system trapped below an impermeable layer (The Hill-Sloan-Tivy "H.S.T. Vein" chert horizon). The HST is known to be sporadically mineralized along its 3 km exposed length. The sporadic mineralization may be explained by the results of our geochemistry and airborne geophysics surveys. These surveys show a correlation between anomalous gold values and structural features cross cutting the regional stratigraphy. This would produce narrow zones of mineralization along the "H.S.T. Vein".

11. Economic Geology (Cont'd.)

The geological mapping shows that our anomalous areas occur near volcanic "breaks", possibly cycle tops. These breaks may represent the extension of the south end of the "H.S.T. Vein" (the Milberry Vein west of Hazard Lake which may be part of the cherty iron formation) and the cherty cap of the Uchi Lake Mine.

Our previously drilled zone on claim 43554 is also an E-W trending feature near a rock type change and it is feasible to extend the Uchi Mine chert trend to this showing. Extending the trend would also bring it through the high humus anomaly on line 1S and 2S which is interpreted to be due to two crossing structures.

12.0 GEOCHEMISTRY

In order to provide correlation and complete cover, humus and soil samples were taken (both where possible). Due to the nature of the topography and the forest fire it was often not possible to get double coverage. However both sample types were individually successful in identifying areas of anomalous response. There is also good correlation between sample types where double coverage was achieved.

At first glance the geochemical data does not seem to make sense, in that anomalous zones do not follow the north-south trend of the regional geology. However, correlation with the airborne V.L.F. shows that the high values are associated with cross cutting structures. The highest concentration of values is at the east end of lines 1S and 2S where two cross structures intersect. The other areas are; line 14N, line 11N, line 7S BL to 250E, lines 5 and 6S at 6E, line 6S/950E and a large area (between lines 2N and 8N west of Four Arm Lake) that corresponds to the Wabanook Bay Fault intersecting a second feature from the north east.

Only anomalous geochemical results (5ppb or greater) are plotted on the geological maps.

REPORT: 013-2952

SUBMITTED BY: NORTHGATE

FROM: OROFINO RESOURCES LTD.
DATE: 02-NOV-83 PROJECT: 430

LOWER ORDER	ELEMENT	DETECTION LIMIT	EXTRACTION	METHOD	SIZE FRACTION	SAMPLE TYPE	SAMPLE PREPARATION
01	AU	5 PPB	AQUA REGIA	Fire Assay AA	-10 MESH/HUMUS	SEIVE	-10

REPORT COPIES TO: G. HARPER
RON ZINN

INVOICE TO: G. HARPER

REMARKS: < MEANS LESS THAN
SAMPLE LIIN-50E WAS ANALYZED IN DUPLICATE.
THE DETERMINED AU VALUES WERE 810 PPB AND
35 PPB.

DETECTION LIMITS FOR GOLD

10 gram sample: 5 ppb.
5 gram sample: 10 ppb.
1 gram sample: 50 ppb.

Sample Wt. 10 g. unless otherwise stated.

NOTE:

Check concentration/sample weight ratio
for effective detection level.

REMARKS: < MEANS LESS THAN

DETECTION LIMITS FOR GOLD

10 gram sample: 5 ppb.
5 gram sample: 10 ppb.
1 gram sample: 50 ppb.

Sample Wt. 10 g, unless otherwise stated.

NOTE:

Check concentration/sample weight ratio
for effective detection level.

SUBJECT: Assessment Approvals
Files: 2.7823 & 7821
Orofino Resources

In reply to your memo of 85 05 15, I would like to explain the procedure regarding the assessment of geotechnical surveys. The booklet "Requirements for submitting Geophysical, Geological, Geochemical Survey Reports", clearly states, under the heading of Special Provision credits, that credits for partial coverage or for surveys not meeting requirements for full credit will be granted on a pro-rata basis. This method of averaging is the normal practice.

Only in situations where a small percentage of the total claims involved in a survey, do we remove those claims partially covered, granting them proportionate credits and allow full credits for those claims fully covered by the survey. As a guide, if greater than 20% of the claims covered by the survey lack full coverage, assessment credits are granted on a pro-rata basis.

With regard to the Orofino surveys, in all cases, greater than 20% lack full coverage and therefore, the credits were allowed on a pro-rata basis. For example on file 2.7821, 8 of the 9 claims lack full coverage.

Therefore, I see no reason to re-assess the files and the allowable credits will remain the same.

Yours sincerely,

S.E. Yundt

Re: Assessment Approvals - Geological Survey 2.7823, 2.7821, Orofino Resources

I have recently received a request to redistribute work credits from Orofino Resources. During a discussion with them, I discovered that the re-distribution was required because of the manner in which geological credits were approved.

When Orofino submitted their geological Report of Work, they realized that they would not receive full credit for claims partially covered by water and therefore assigned extra credits to these claims to make up for the anticipated loss of geological credits. They expected that the credits would be approved for each individual claim. It appears that in this instance, an averaging principle was used and partial credit was allowed on all claims. As a result, Orofino now finds it is deficient on many claims which they expected full credit.

Is it normal procedure to use the averaging principle in geological surveys? If not, would you consider re-approval of credits? Or, if Orofino has not done sufficient work to receive full credit, again, would you advise me.

Thank you,

Scott Rivett

Dear Sir:

Enclosed are two copies of a Notice of Intent with statements listing a reduced rate of assessment work credits to be allowed for a technical survey. Please forward one copy to the recorded holder of the claims and retain the other. In approximately fifteen days from the above date, a final letter of approval of these credits will be sent to you. On receipt of the approval letter, you may then change the work entries on the claim record sheets.

For further information, if required, please contact
Mr. R.J. Pichette at 416/965-4888.

Yours sincerely,

A handwritten signature in black ink, appearing to read "S.E. Yundt".

Notice of Intent
for Technical Reports

1985 03 22

2.7823/22-85

An examination of your survey report indicates that the requirements of The Ontario Mining Act have not been fully met to warrant maximum assessment work credits. This notice is merely a warning that you will not be allowed the number of assessment work days credits that you expected and also that in approximately 15 days from the above date, the mining recorder will be authorized to change the entries on his record sheets to agree with the enclosed statement. Please note that until such time as the recorder actually changes the entry on the record sheet, the status of the claim remains unchanged.

If you are of the opinion that these changes by the mining recorder will jeopardize your claims, you may during the next fifteen days apply to the Mining and Lands Commissioner for an extension of time. Abstracts should be sent with your application.

If the reduced rate of credits does not jeopardize the status of the claims then you need not seek relief from the Mining and Lands Commissioner and this Notice of Intent may be disregarded.

If your survey was submitted and assessed under the "Special Provision-Performance and Coverage" method and you are of the opinion that a re-appraisal under the "Man-days" method would result in the approval of a greater number of days credit per claim, you may, within the said fifteen day period, submit assessment work breakdowns listing the employees names, addresses and the dates and hours they worked. The new work breakdowns should be submitted direct to the Land Management Branch, Toronto. The report will be re-assessed and a new statement of credits based on actual days worked will be issued.

Dear Sirs:

RE: Geological & Geochemical Survey and
Data for Assaying submitted on Mining
Claims KRL 648720, et. al., in Earnings
Township

This will acknowledge receipt of the above-described
survey on February 18, 1985.

This file has been reviewed and it has been determined
that the geochemical portion of the above-described
survey does not qualify for assessment under the
Special Provisions Method as there has not been a
minimum of forty samples taken per claim. However,
this survey can be assessed on a "Man-days" basis.
Please complete the enclosed "Assessment Work Breakdown"
in duplicate.

Also, there is some difficulty in correlating the
cancelled cheques to the Certificates of Analyses.
Please provide an explanation of which cheques cover
which certificates.

When submitting this information, please quote file 2.7823.

For further information, please contact Susan Hurst
at (416)965-4888.

Yours sincerely,

S.E. Yundt

Mr. S. E. Yunt
Land Management Branch
Whitney Block, Rm 6643
Queen's Park
Toronto, Ontario M7A 1W3

Dear Sir:

Please find enclosed two copies of our Report on Exploration Activities (Geology and Geochemistry) with accompanying maps (3) and geochem results.

Geochemical and expenditure credits have only been applied for on work programs on unleased claims. Analysis plus preparation

soils	\$7.75	humus	\$8.50
X	604	+ X	477
4,681.00		+ 4,054.00 = \$8,735.5	

40 days special provisions has been applied for geochemical surveys. Humus samples were taken by one person and soils by another to maintain consistency.

Due to the large number of small lakes on the property I anticipate being cut back on the special provisions credits in proportion to coverage. I have therefore included estimates based on proportion of water for geology + line cutting and 80 samples/claim (40 soil 40 humus) for geochemistry.

Yours truly
