INTRODUCTION

This report presents and summarizes the results of two diamond drill holes, 994 metres of BQTK core, completed for Goldcorp Inc. on the Marboy property in Dome Twp. located within the Municipality of Red Lake, Ontario (Figure 1).

The drill program was conducted during the period of April 6th to April 17th, 2001. The holes were drilled on a recut Goldquest grid (ca 1983) consisting of 100 metre spaced lines with a baseline oriented at N40°E. Drill targets were developed from a combination of magnetic and MMI soil geochemistry surveys plus a re-interpretation of data from previous drilling.

Reg Seyler of McKenzie Island developed the drill targets with field supervision and core logging by Andrew Tims of Timmins, Ontario.

LOCATION AND ACCESS

The Marboy property is located in Dome Township of the Red Lake Mining Division. The property is approximately 800 metres north of the Cochenour Gold Mine on NTS sheet 52N/4.

Access to the property is gained via the McMarmac town site road to the McFinley Mine road. A left turn at a fork in the road immediately past the Shewchuk sandpit accesses the drill road onto the Marboy Peninsula. The drill road for the 2001 drilling branches off to the drill sites 1.2 kilometres to the west (Figures 1).

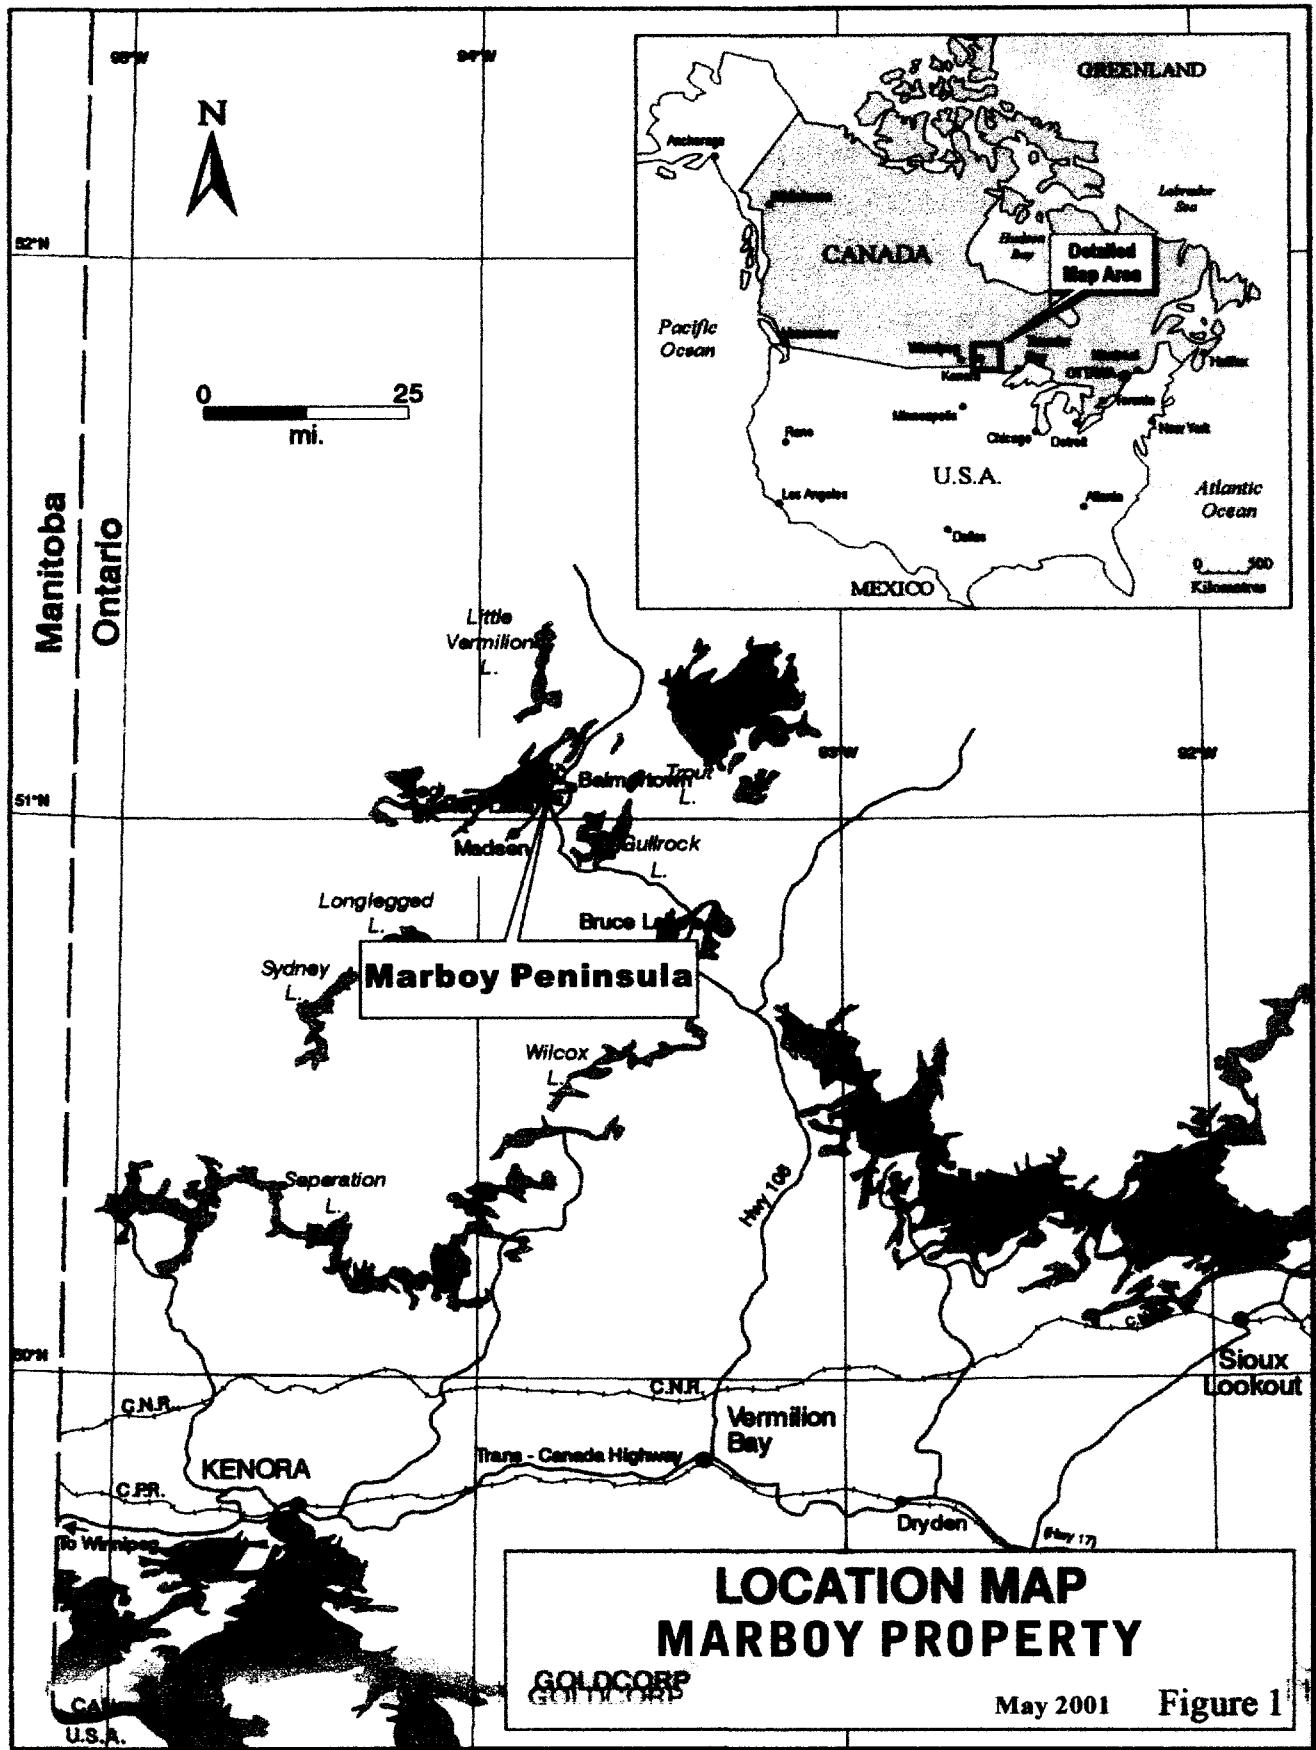

CLAIMS AND OWNERSHIP

The Marboy property consists of 16 contiguous patented claims, comprising approximately 229 hectares of both surface and mining rights (Figure 1). Goldcorp Inc. inherited the claims from Goldquest Exploration Inc. through its merger with Dickenson Mines Ltd. in 1994. The work program described herein was undertaken within leasehold patents 441 & 433 of the Land Registry Division of Kenora.

PREVIOUS WORK

The Marboy property was one of the earliest prospects on the Red Lake camp to have been worked.

- 1927 Nortricia Mining Co. Ltd. acquired a group of 52 claims that included the Marboy Peninsula. Work consisted of prospecting and outcrop stripping;
- 1928 Red Mammoth Gold Mines Ltd. acquired the property but concentrated all work on the claims hosting the carbonate alteration associated with the future McMarmac Mine;
- 1933 Margaret Mines Ltd. optioned the property and concentrated all work on the McMarmac deposit;
- 1936 Richmac Gold Mines (1936) Ltd. purchased claims 431, 432, and 433 from Mr. Boyle and S. Sky. Richmac also optioned the original group of 52 claims and in addition to drilling and sinking a second shaft on the McMarmac deposit 73 short diamond drill holes were completed totalling 1 310 m on the Marboy Peninsula over a two year period;

- 1937 E.J. Lees conducted a geological examination of the claim group for Richmac Gold Mines Ltd;
- 1939 Richmac Gold Mines (1963) Ltd. sold claims 432 and the southeast corner of claim 431 to McKenzie Red Lake Mines for the cost of incorporating McMarmac Red Lake Gold Mines Ltd.
- 1943 Richmac Gold Mines (1963) Ltd. completed 7 diamond drill holes on the Marboy Peninsula totalling 610 m;
- 1945 Richmac Gold Mines (1936) Ltd. completed one hole from the Cochenour Mine underground workings to test claim 442 and 14 surface holes on the Marboy Peninsula testing a carbonate zone on claim 433 all totalling 2 133 m;
- 1948 Boymar Gold Mines Ltd. optioned the property but completed work only on the exhausted McMarmac Mine site;
- 1960 Marboy Mines Ltd. optioned the ground and continued work on the McMarmac Mine site through till 1969;
- 1976 Nickel Rim Mines Ltd. gained control of the property;
- 1982 The property became part of the holdings of Goldquest Exploration Inc. a division of Dickenson Mines Ltd;
- 1983 A program of line cutting, magnetic/EM surveys and outcrop mapping was completed by Goldquest Inc.
- 1984 Goldquest completed a program of mechanical outcrop stripping and channel sampling;
- 1994 Dickenson Mines Ltd. merged with Goldcorp Inc.
- 1998 High Sense Geophysics Ltd. Of Richmond Hill, Ontario flew a magnetic, electromagnetic/radiometric survey of 100 m spaced lines over the eastern portion of the Red Lake Belt Goldcorp Inc. during November & December;
- 2000 Goldcorp Inc. recut the original Marboy Mines Ltd. grid and completed a 73 sample MMI soil survey on the Marboy Peninsula;

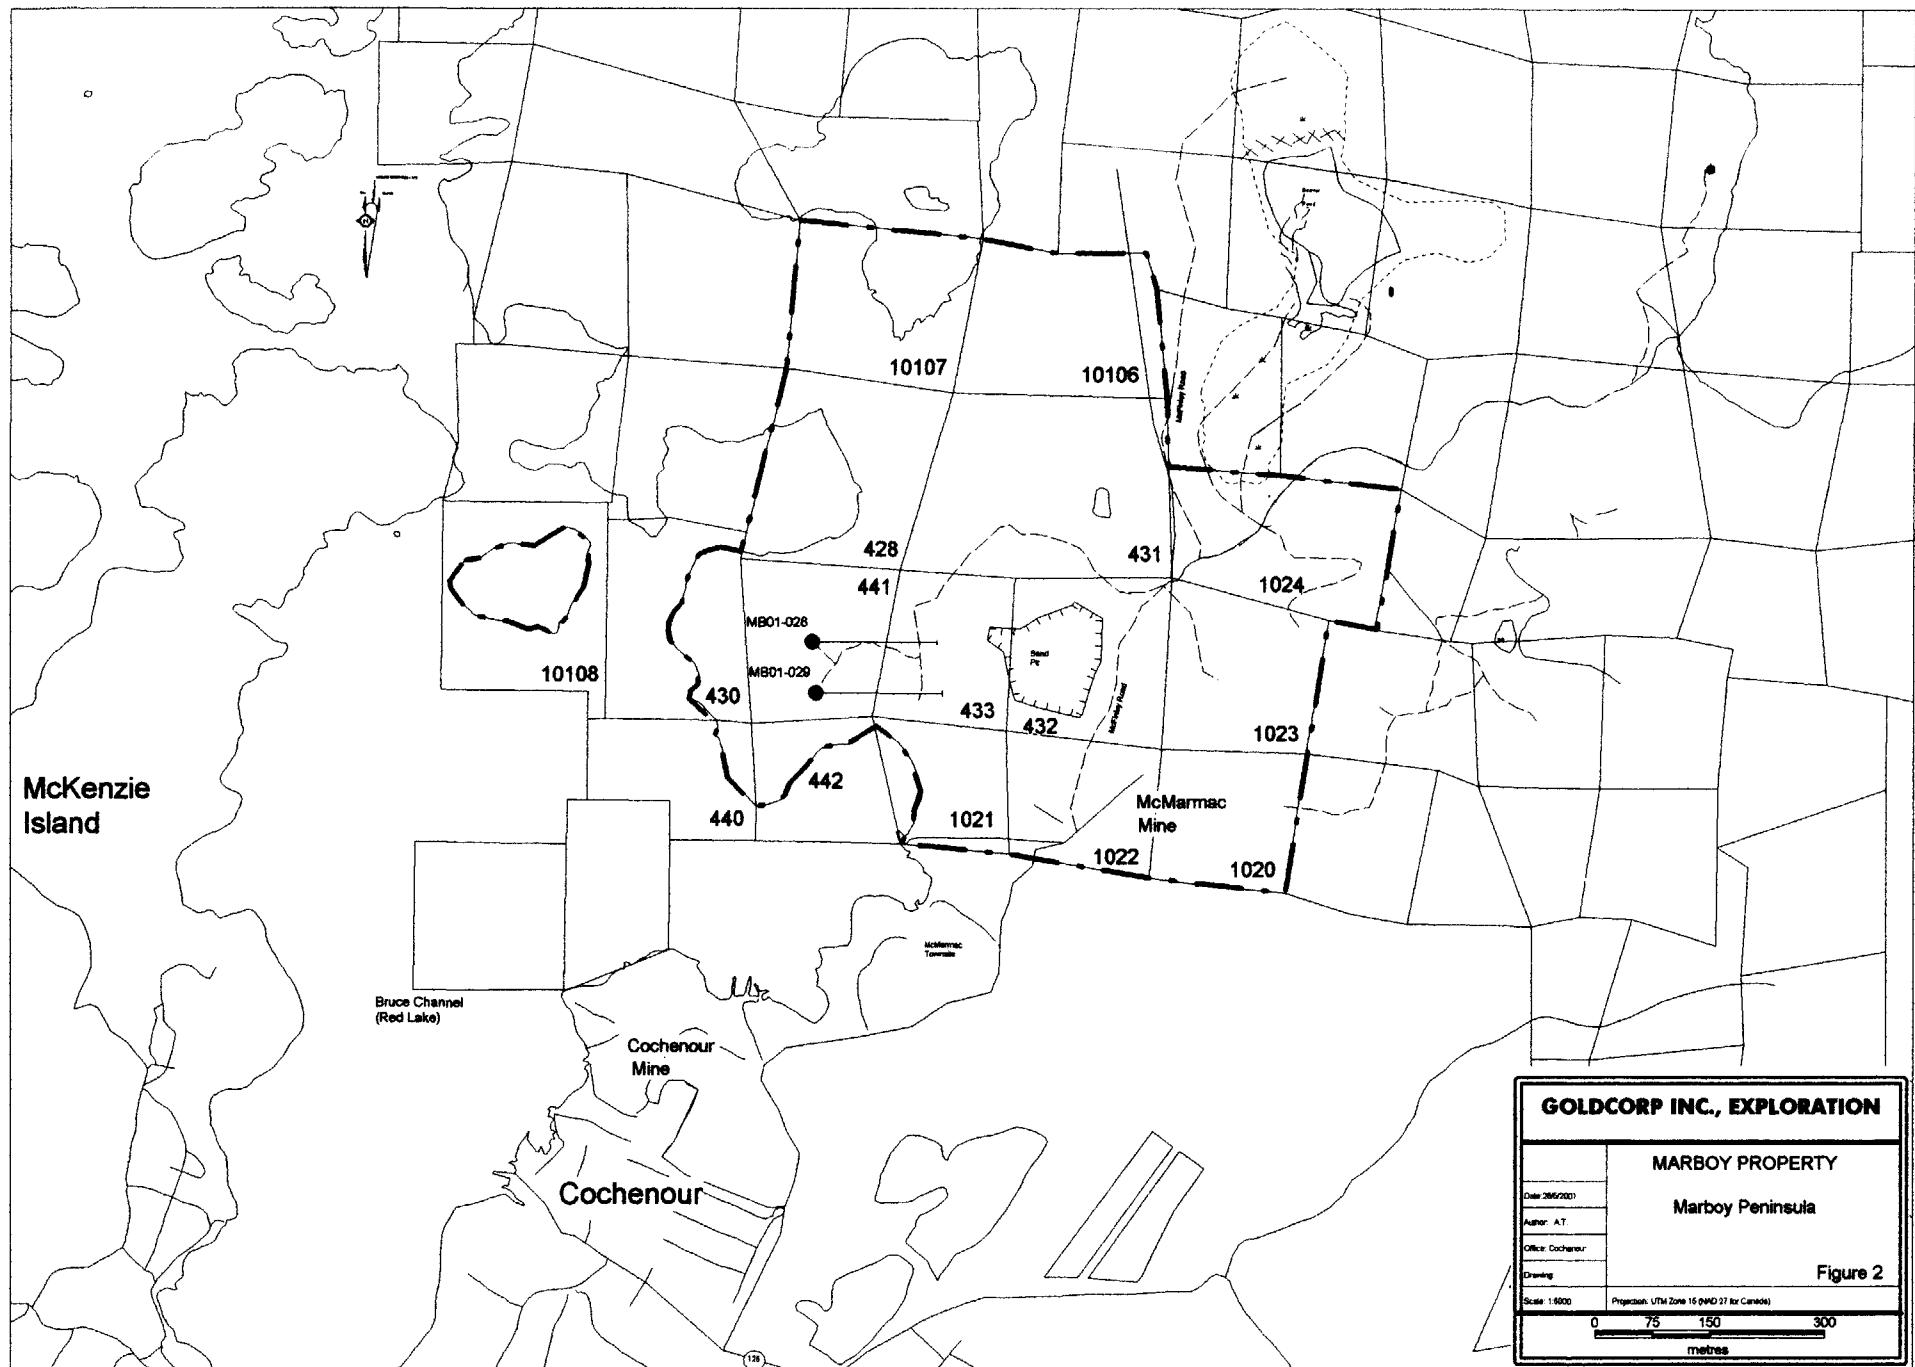

DRILL PROGRAM SUMMARY

Drilling commenced on April 6th and was completed on April 17th, 2001. N. Morissette Drilling Ltd. of Cochenour, Ontario was contracted to perform the diamond drilling using a Longyear 70 drill rig. The drill program consisted of 2 BQTK holes, numbered MB01-028 and MB01-029, totaling 994 metres.

The drilling was carried out on patented claims 441 & 433. All holes were collared at a dip of -50°. Diamond drill logs are included in Appendix 1 while assay certificates for gold and 22 element ICP are listed in Appendix 2. Drill plans and sections are located in Appendix 3.

A total of 190 samples were taken for Au by fire assay with AA finish and 22-element ICP scan. Five of the samples were also analyzed for major whole oxides using ICP-MS including a 36 element add-on package. Samples returning values greater than 10 000 ppb Au were reassayed using a gravimetric assay and an AA finish. Chemex Labs in North Vancouver carried out all assaying. Sample lengths averaged .75 metres.

Samples were logged and split in the Goldcorp Inc. core facility at the Cochenour Mine property and shipped to the Chemex Labs prep facility in Thunder Bay after each hole was completed. All drill cores are stored outdoors in core racks at the Cochenour Mine site.

REGIONAL GEOLOGY

The Red Lake Greenstone Belt is a narrow volcanoclastic assemblage of Archean age rocks that forms part of the larger Uchi subprovince of the Superior province. The belt is subdivided into several sequences based on age, compositional and tectonic characteristics. The following nomenclature of Dube et al (2001), the assemblages are:

- The volcano-dominated Balmer assemblage (2.99 Ga) at the eastern end of the belt;
- The 2.94-2.92 Ga Ball assemblage at the western end of the belt consisting of mafic, intermediate, and felsic volcanics of a calc-alkalic affinity and;
- The Bruce Channel assemblage of 2.89 Ga near the east end of the belt composed of mafic volcanic flows, felsic pyroclastics, and a thick sequence "Timiskaming-like" sediments including iron formation.

The Woman assemblage, a fourth assemblage, is present elsewhere in the Uchi subprovince but in the Red Lake belt is found only on McKenzie Island with an angular unconformity separating it from the previous mentioned units.

PROPERTY GEOLOGY

Lithology

The Goldcorp Inc. drill program intersected: mafic volcanic flows and tuffs, ultramafic volcanics and feldspar porphyry dykes. A classification criterion for each lithology is described in the following section.

Volcanics

Mafic Volcanic Flows (coded 1,1a,1aa,1m & 1p) are medium to dark green in colour, typically a massive, fine-grained, locally amygdaloidal and/or exhibit well developed pillow and inter-flow breccia textures.

Mafic Volcanic Tuffs (coded 1c) are light grey to medium green in colour, fine-grained with a granular texture to the matrix, locally trace to 1% dark green chloritic shards, minor lapilli size fragments making up to 5% of the unit, the matrix is typically altered by weak pervasive carbonate or sericite.

Ultramafic Volcanics (coded 6) are fine-grained, blue-grey in colour, the groundmass is dominated (50-85%) by serpentine plus weak to moderate talc (1-5%) alteration, the unit is strong to moderately magnetic due to 1-5% magnetite in the groundmass, moderately fractured with locally up to 20% centimetre scale quartz ankerite veining, fresh (less altered) intervals exhibit relic cumulate textures of olivine.

Intrusives

Feldspar Porphyry Dykes (coded 7b) possess a fine-grained, medium grey groundmass with 30-40% subhedral to euhedral medium-grained white to beige feldspar within a quartz-feldspar groundmass. The unit is typically massive with locally a very weak alignment of biotite grains over short intervals. Contacts are sharp and are at acute angles to the major lithological contacts.

Drill log Summary

MB01-028

TT98-01 was spotted to test a zone of silicification with 1-2% pyrite and pyrohhotite intersected in hole S-600 by Boymar Gold Mines Limited in 1950. The drill hole collared into massive mafic volcanic with minor patchy silicification to a depth of 207 metres. A variably magnetic serpentine-talc rich peridotite averaging 3-4% millimetre scale quartz-ankerite veinlets followed to a depth of 284 metres. A mafic volcanic tuff in sharp contact with the above-mentioned ultramafic possessed weak sericite alteration of the matrix with 5-10% chlorite altered lapilli. A second serpentine-talc ultramafic unit was subsequently intersected to a depth of 323 m where an amygdaloidal mafic flow was encountered. The chloritic groundmass of the mafic flow possessed patchy centimetre scale silica alteration with 1-2% blebby pyrite. The mafic volcanic continued to 469 m where a feldspar porphyry dyke was encountered to the end of the hole at 503 metres. The most significant assay was 10 559 ppb gold from a 16 cm wide quartz-ankerite-tourmaline veinlet with ½-1% pyrite at 452.85 m.

MB01-029

Hole MB01-029 was positioned to test a MMI soil anomaly of 1.49 ppb gold. The hole collared into massive mafic volcanic flows from 21 m to a depth of 39 m. The unit was weak to moderately fractured with weak to moderate pervasive carbonate alteration. An underlying serpentine-talc rich ultramafic unit followed to a depth of 57 m. This magnetic unit was moderately to strongly fractured and cut by up to 5% centimetre scale quartz-ankerite veinlets. A fine-grained mafic tuff was encountered afterwards to a depth of 60 m followed by a serpentine-talc rich ultramafic unit to 66 m. A succession of metre scale mafic tuffs and ultramafic units continues to 95 m where an ultramafic unit was encountered to a depth of 153 m. A 2.6 m wide weakly bedded mafic volcanic tuff followed to a depth of 156 m where a similar ultramafic unit was traversed to a depth of 201 m. A medium green, moderately chloritic mafic volcanic possessing patchy irregular pale grey silica alteration followed to a depth of 297m. The silicification typically hosts ½-1% pyrohhotite and trace-1/2% pyrite as diffuse irregular foliation parallel stringers. A non-magnetic serpentine rich ultramafic was then encountered to 335 m. Within this unit a 5 m wide feldspar porphyry dyke was encountered at 20° to the core axis. A moderately fractured dark green mafic volcanic flow followed to a depth of 372 m. The volcanic possessed a well-developed fine breccia texture with the intensity of a pervasive carbonate alteration increasing down hole with locally metre scale moderate biotite alteration. A quartz-carbonate vein system then followed to a depth of 385 m. This interval consisted of a chaotic, brecciated mass of quartz-ankerite with nil to trace sulphides within a variolitic mafic volcanic. A well preserved variolitic pillowed mafic volcanic unit followed to a depth of 395 m where a massive amygdaloidal mafic flow was encountered to the end of the hole at 491 m. The patchy

silicous alteration within the mafic volcanics from 335 to 372 m. produced erratic weakly anomalous gold values including: 1 520 pp over 2 m. at 204 m, 1 585 ppb at 222.5 m and 5 730 ppb at 260.75 m depth. No detectable gold values were obtained from the quartz-ankerite vein system from 372 to 385 m.

CONCLUSION AND RECOMMENDATIONS

Diamond drill hole MB01-028 did encounter weak silicification but no gold values were returned from the altered volcanics. The one anomalous gold assay of 10.5 g/t from a small quartz-ankerite vein occurred as an isolated response lacking a significant alteration envelope. Small moderate to high grade quartz-ankerite-tourmaline veins such as the one intersected in MB01-028 are common in the Red Lake mining camp and follow up drilling rarely proves otherwise.

Hole MB01-029 did encounter irregular patchy silica alteration with sporadic low-grade gold assays. Though interesting the results to date are not significant enough to warrant follow up work due to the random and low-grade nature. The quartz-carbonate vein system encountered in the hole MB01-029 was unmineralized and yielded no anomalous gold values. The gold in soil values are due to the auriferous nature of the patchy silicification in the mafic volcanics.

Patchy silicification with infrequent low to moderate-grade gold values has been reported in many of the historical drill holes within the area of the Marboy Peninsula. Further work on the Marboy Peninsula should include:

- 1) A compilation of previous work to outline the nature and extent of the patchy silicification and;
- 2) Additional MMI Soil sampling to complete the coverage over the area.

LOGGING CODES FOR DRILL LOGS

Unit Type	Computer unit	Used to separate main (primary), secondary and tertiary rock units M - main S - secondary T - tertiary EOH - end of hole
FABRIC		Type, Strength and Angle
	TYP	Type of fabric BD - Bedding FLT - Faulting VN - Veining FOL - Foliation SHR - Shearing CON - Contact
	STR	Strength Scale (see below)
	ANG	Core angles - expressed as the angle between the core axis and the n 0 - parallel to core 90 - perpendicular to core

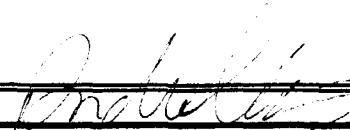

Structure, Alteration and Magnetism Codes: See Strength Scale below.

BXN	Brecciation	Relative brecciation
SHR	Shearing	Strong foliation to strong schistosity
VN	Veining	Generally quartz and/or iron carbonate
BLE	Bleaching	Commonly related to carbonatization or silicification
SIL	Silicification	Weak replacement to pervasive flooding and veining. (May include unrecognized albitization.)
DOL	Dolomitization	(Iron Carbonate) Weak replacement to pervasive flooding and veining
CAL	Calcification	(Calcite) Commonly as fracture-filling and veining, occasionally pervasive
BIO	Biotization	Degrees of pervasive replacement. Occasionally producing segregations
SER	Sericite	Analogous to biotization but usually in felsic lithologies
CHL	Chloritization	Degrees of pervasive replacement. Occasionally producing segregations
TLC	Talc	Degrees of pervasive replacement. Occasionally producing segregations
M.A.	Magnetic Attraction	Relative strength of attraction to a magnet
%PY	Pyrite (%)	Visual estimate - percent of volume
%PO	Pyrhotite (%)	Visual estimate - percent of volume
%VN	Veining (%)	Visual estimate - percent of volume
	Qz	quartz
	Fe	iron carbonate
	Cal	calcite

Strength Scale

Strictly subjective, estimated by the geologist who logs the core.

- 0 None
- 1 Weak
- 2 Moderate
- 3 Strong

GOLDCORP	COMPANY: GOLDCORP INC.	TWP. OR AREA: Dome Twp.	HOLE NUMBER: MB01-029
	PROPERTY: Marboy/Marboy Peninsula	CLAIM NO: patent 441 & 443	NTS: 52N/4
LOCATION: 7+00 E 19+00 S		COLLAR ELEV. Not surveyed	DATUM:
UTM ZONE: 15	UTM EASTING: 443757	UTM NORTHING: 5659455	
DATES DRILLED: From: April 6/2001 To: April 11/2001			
DRILLED BY: Morissette			
ASSAYED BY: Chemex			
OVERBURDEN: 24	CASING LENGTH:	VERT. DEPTH:	
CASING DRILLED:			
CASING RECOVERED:	None		
BITS & SHOES LOST/USED:			
DESCRIPTION OF OVERBURDEN:	Unknown		
WATER SOURCE: Red Lake			
LENGTH OF WATER LINE: 500 m			
DRILL CUTTINGS SAMPLED? No			
CORE RECOVERY: N/a			
SPECIAL DRILLING PROCEDURES:			
DRILL COLLAR MARKED BY: Casing left in Hole, & capped			
If casing left in place, will the hole pump sufficient water for drilling? No			
PURPOSE OF THIS HOLE: Western extention of Cheveron zone			
RESULTS:			
COMMENTS:

Dear Sir or Madam

Submission Number: 2.21603
Transaction Number(s): W0120.30308

Subject: Approval of Assessment Work

We have approved your Assessment Work Submission with the above noted Transaction Number(s). The attached Work Report Summary indicates the results of the approval.

At the discretion of the Ministry, the assessment work performed on the mining lands noted in this work report may be subject to inspection and/or investigation at any time.

If you have any question regarding this correspondence, please contact BRUCE GATES by email at bruce.gates@ndm.gov.on.ca or by phone at (705) 670-5856.

Yours Sincerely,

A handwritten signature in black ink, appearing to read "Roy Spooner".
