Map; Scale 1:2500 (in rear pocket)
INTRODUCTION

This report describes the results of a geological mapping and sampling program carried out over a ten (10) claim gold/base metal prospect located in the Shabumeni Lake Area of north-western Ontario. The work was carried out during the period Aug. 10 - Sept. 7 1992; on a chainsawed grid which covers the entire property with 30 meter spaced lines.

A detailed description of the principal rock types encountered during the course of the survey is provided, along with a record of the character and dimension of veins and mineralized zones. Recommendations for further development of the property are also made. The survey was conducted by Rand Hodgson, geologist, of 1849 E. 2nd Ave., Vancouver, B.C.

PROPERTY DESCRIPTION, LOCATION AND ACCESS

The property is referred to as the "Guest Prospect" in government publications. It consists of ten contiguous unpatented mining claims located at the north-eastern edge of Swain Lake on the Shabumeni Lake Area claim map G-1881; Red Lake Mining Division; NTS Reference # 52-N-7 SE

Swain Lake is located approximately 90 kilometres north-east of the town of Red Lake. Access is by float-equipped aircraft from Red Lake or Ear Falls, or by boat through the Woman Lake water system.

The claims are registered in the name of Dennis Smith of Box
663, Red Lake, Ontario. They are jointly owned by Smith, Gerald Desmeulles, also of Red Lake, and Rand Hodgson of Vancouver, B.C. The claims schedule, containing a list of the claims and their assessment work due dates, is provided in the Appendix.

TOPOGRAPHY AND OVERBURDEN

All bedrock is Early Precambrian in age, part of the Birch/Uchi Lakes metavolcanic - metasedimentary belt within the Uchi Subprovince. A major north east trending deformation zone, the "Swain Lake Deformation Zone" (S.L.D.Z.) passes close to the property to the north-west. The rocks to the south-east of this deformation zone (including those on the property) are predominantly metasedimentary.

"The Guest prospect is located about 800 m south-east of the S.L.D.Z. and is 1.2 km west of a north-west trending fault extending through Bobarris Lake. A strong shear zone trends 060° to 090° along a contact between mafic metavolcanic flows and intermediate pyroclastic rocks immediately north of the Guest prospect.

East trending mafic metavolcanic flows intercalated with interflow metasediments consisting of siliceous tuff and chert-magnetite iron formation, are overlain by intermediate lapilli tuff, tuff breccia and feldspar crystal tuff (Beakhouse et al. 1989; Beakhouse 1989). The intermediate pyroclastic rocks were previously interpreted as metasediments by Asarco Exploration Co.

of Canada Ltd. Interflow iron formation is interlayered with chloritic tuffs and jasper. The metavolcanic rocks are intruded by hornblende syenite and quartz porphyry dikes and by the Swain Lake stock of diorite composition which is amphibole- and feldsparphyric (Beakhouse et al. 1989; Beakhouse 1989). The metavolcanic rocks at the Guest prospect are part of the Cycle III sequence described by Thurston (1985, 1986)."*

SUMMARY OF PREVIOUS EXPLORATION AND DEVELOPMENT

"1963: Staked by Gunnex Ltd., but exploration work was concentrated on the Swain Lake Cu-Co occurrence on the south shore of Swain Lake.

1965-1966: Staked by A.L. Guest Prospecting Grubstake and optioned to Asarco Exploration Co. of Canada Ltd. in joint venture with Noranda Explorations (The Northern Miner, July 7, 1966). Asarco conducted ground magnetic, electromagnetic and induced polarization geophysical surveys, geological mapping and diamond drilled 12 packsack drill holes totalling 160 m.

1969-1970: Vanco Exploration of Ontario Ltd. flew airborne magnetic, electromagnetic and gamma-ray spectrometer surveys over the property and conducted geological mapping and ground magnetic and self-potential geophysical surveys.

1974: St. Joseph Exploration Ltd. diamond drilled 3 holes totalling 556 m on claims KRL 368576 and 3685677.

1983-1984: Labrador Exploration (Ontario) Ltd. staked the Guest prospect which they referred to as the Signal claim group. The company conducted magnetic and horizontal loop geophysical surveys and diamond drilled 2 holes totalling 264 m.

1987: Explorcor Properties Inc. conducted magnetic and electromagnetic geophysical surveys, as well as geological mapping and rock, soil and humus geochemical surveys.
1989: Noranda Exploration Co. Ltd. conducted prospecting and lithogeochemical sampling on the property.

1991: The guest property was staked by D. Smith.**

PROPERTY GEOLOGY AND STRUCTURE

Detailed mapping by the author has resulted in a map which is generally in agreement with the most recent government work. Mafic flows predominate in the southern part of the property and are overlain by a felsic pyroclastic unit to the north. Sulphide enrichment occurs within a sheared metasedimentary unit at the contact between the mafic flows and the felsic pyroclastics. The metasedimentary unit exhibits strong shearing and consists of intercalated chert, iron formation, and chlorite schists (mafic tuffs?). It contains pods, lenses, and stringers of pyrite, chalcopyrite, pyrrhotite, and minor sphalerite with associated sericite, carbonate, ankerite, and gold.

This sediment/shear zone is 200 meters thick and strikes the same as the regional strike - that being approximately 100°.

There is strong evidence to suggest the presence of a north-east trending thrust fault which passes through the lake at the north end of claim 1143545. At the south-west corner of the lake there are several occurrences of fault breccia with ankerite, biotite, and epidote. Also at this location (on the shoreline) is an outcrop of feldspar crystal tuff/lapilli tuff which is specifically diagnostic of the felsic pyroclastic unit normally found 150 meters to the north - see accompanying map. This would
also explain the apparent discontinuity of the iron formation/sedimentary unit.

The mafic flows to the south are generally fine-grained, pillowed, and silicified. Tourmaline and garnet are sometimes found in pillow selvages. In amygdaloidal flows, graded vesicle beds indicate tops to the north. Gabbros and quartz-feldspar porphyry are also found in this unit, possibly reflecting proximity to the Swain Lake Pluton which outcrops at the southern extremity of the property.

The felsic pyroclastic unit is very distinct and consistent. The textures are white feldspar crystal tuffs, lapilli tuffs, and agglomerates. Sericitic alteration is common, which becomes dominant as the unit grades into the sericitic shear zone on the south side of Bobarris Lake (400 meters east of the property).

**MINERALIZATION**

Sulphide mineralization is predominantly associated with the metasedimentary unit between the mafic and felsic volcanics and locally within the felsics. The original Guest Occurrence consisted of the North showing (12-13 N, 160-170 W, on the grid) and the South showing centred on 10+50 N, 157 W on the grid. The highest recorded results from these showings are as follows:

**South Showing**

- 4% Cu across 1.4 ft. and 2.15% Cu across 6.3 ft. from pack-sack drilling (Asarco)
- grab sample of 0.22 ounces per ton Au. (Labrador)
- channel sample of 0.06 ounces per ton Au across 5 ft. (Noranda)
North Showing

- grab sample of 0.9 ounces per ton Au (Noranda)
- diamond drilling - 0.11% Cu and 0.08 o.p.t. Au across 5 ft. (St. Joe)

In addition to these, a significant new shear zone has been discovered (during this survey) in the felsic pyroclastic unit to the north. Located at 15 N on line 146 W of the grid, the zone is at least 10 meters thick and consists of a series of 10-20 cm thick quartz-carbonate-sulphide veins and stringers within a sheared sericitic schist. Several grab samples taken at different locations across strike within the zone indicate consistent high anomalous gold values up to 5280 ppb in the quartz and 1770 ppb in the sericite schist. Similar sericite schists in intermediate pyroclastics on the south side of Bobarris Lake (12 N, L 122 W on grid) gave consistent results up to 6,750 ppb.

A soil sample survey done by Exploreco in 1987 indicates consistent exceptionally high gold values commonly up to 300 ppb spread out all across the property's different lithologies. One soil sample assayed 2690 ppb Au (13+50 N, 140 W)

CONCLUSIONS AND RECOMMENDATIONS

The property comes highly recommended for the following reasons:

1.) Consistently high gold values in soil (up to 300 ppb and above) throughout the property.
2.) Presence of several faults and gold bearing shear zones with economic grade mineralization intersecting with the main regional Swain Lake Deformation Zone.

3.) Numerous unexplained V.L.F. electromagnetic conductors within both the mafic flows and the felsic pyroclastics present drill targets for both gold and base metal mineralization.

Four drill targets have been isolated based on a compilation of previous geophysical surveys and the author's findings. These are located on the map at the following locations on the grid:

i) 11+50 N, L130W
ii) 8 N, L15W
iii) 13 N, L126W
iv) 15 N, L146W

There is no doubt that detailed ground geophysics will outline more drill targets from the many known V.L.F. conductors on the property.

Respectfully submitted,

Rand G. Hodgson, B.Sc., B.Ed.  Date of Signature: Nov 14/92

Swain Lake Property  1991 Assays

Assay List

* All are rock grab samples.

1) RH-1 - chert with pyrite - location: 159 W, 13 + 75 N, grid: 0.08 ppm Au.

2) RH-2 - 146 W, 15 N - quartz vein with pyrite - 750 ppm Au.

3) RH-3 - 146 W, 15 N - sericite schist - 450 ppm Au.

4) RH-4 - 165 W, 13 N - quartz carbonate vein from edge of north shear zone, py.

Earlier Samples - for Cu:

South showing: 156 W 8 + 25 m N.

5) 282275 - basalt with mag + cp = 0.69% Cu.

6) 282276 - " " " - 5.4% Cu.

7) 282276 - " " " - 500 ppm Au.

Dear Sir/Madam:

Subject: APPROVAL OF ASSESSMENT WORK CREDITS ON MINING CLAIMS
KRL.1143524 ET AL. IN THE SHABUMENI LAKE AREA

The deficiencies in the original submission have been rectified.

The assessment work credits for the Geological Survey and Assays filed under Sections 12 and 17 of the Mining Act Regulations have been approved as outlined on the attached Assessment Work Credit Form. The approval date is February 23, 1993.

Please note that the "Values of Assessment Work Done" and "Applied" have been approved at a higher amount on all the claims.

I am enclosing the correspondence from the client requesting how the work is to be applied on each claim. A revised Statement of Costs is also enclosed for your records.
February 24, 1993
Red Lake Mining Recorder

If you have any questions regarding this correspondence, please contact Lucille Jerome at (705) 670-5855.

Yours sincerely,

Mark Hall

Randal Hodgson

Date: Nov 14 1992

For Office Use Only

Total Value (in Recorded: 0.00

Deemed Approval Date: Jan 25 1992

Date Approved: Feb 24 1992

Date Notice for Amendments Sent:
Credits you are claiming in this report may be cut back. In order to minimize the adverse effects of such deletions, please indicate from which claims you wish to prioritize the deletion of credits. Please mark (✓) one of the following:

1. Credits are to be cut back starting with the claim listed last, working backwards.
2. Credits are to be cut back equally over all claims contained in this report of work.
3. Credits are to be cut back as prioritized on the attached appendix.

In the event that you have not specified your choice of priority, option one will be implemented.

Note 1: Examples of beneficial interest are unrecorded transfers, option agreements, memorandum of agreements, etc., with respect to the mining claims.

Note 2: If work has been performed on patented or leased land, please complete the following:

I certify that the recorded holder had a beneficial interest in the patented or leased land at the time the work was performed.
Statement of Costs

Direct Costs

Wages - $250 x 35 km = $8,750
Assays 35 samples → 350
Boat Fuel → 50
Camp Supplies → 200
Rental Boat/Motor → 850
Rental Camp Equipment → 850
Total direct → $11,050

Indirect

Food & lodging → 1500
Truck → 1800
Motor/demol. → 1500
Aircraft/Rental Fuel and related costs → 1500

6700 max 20% = $2310

Total Expense claimed → $13,260

Total 10 claims - will claim $1,326 dollars
on each claim - see enclosed copies of original
work report - amended at proper place.
Certification → over

MINING LANDS BRANCH
THE CANADIAN SPACE AGENCY SEEKS ASTRONAUTS

Canadian Astronaut Program

The Canadian Astronaut Program was established to train and maintain a corps of astronauts to conduct experiments on board NASA's space shuttles.

- Since its creation in 1983 with the selection of six astronauts, it has acquired a reputation for excellence in the international space community.
- Before the end of 1992, three Canadian astronauts will have flown on missions in which they conducted experiments on behalf of researchers in Canada, the USA and Europe.
- Before the end of the decade, the International Space Station Freedom will be in orbit and our participation in that program requires the support of Canadian astronauts.
- Canadians will serve on board the space station not only as system operators but will also continue to carry out research and development activities in space on behalf of scientists and engineers in industry, universities and government laboratories.

To apply, send your résumé before February 3, 1993, to the following address:
Astronaut Recruitment Program
Canadian Space Agency
P.O. Box 278, Station B, Montreal, Quebec H3B 3J7.

Exciting Career Opportunities

The Canadian Space Agency is currently recruiting astronauts to participate in the Canadian Astronaut Program as Mission Specialists and Payload Specialists.

- Mission Specialists ensure the operation of orbiter systems, including the Canadarm used for the deployment and retrieval of payloads in orbit. They are also trained for Extra Vehicular Activity (such as spacewalk repair) and the operation of scientific equipment.
- Payload Specialists are astronauts whose primary responsibility is to conduct experiments in space which require substantial knowledge of the science involved.
- Canadian astronauts may be assigned to either of these duties and to space station crew duties.

Additional positions for engineers and scientists may also be available within the Canadian Space Agency.

Qualifications

The candidates must be Canadian citizens and have at least a Bachelor's degree from a recognized university in engineering, physical science, biological science, medicine or math.

- To be considered, they must also have a minimum of three years of related professional experience after graduation. An advanced degree could compensate for years of practical experience.
- Because astronauts have to work under difficult physical and psychological conditions, applicants must be willing to undergo physical and psychological examinations. These will be performed in accordance with the requirements of the Canadian Space Agency, NASA and the other international partners of the Space Station Freedom Program.
- As astronauts participate in many public events, good communication and presentation skills are necessary.

All positions will be located in the greater Montreal area, and successful candidates will be required to work in Ontario until the Agency's new facilities are completed, effective for 1993.

Applications will not be accepted by telephone or fax.
